As it is, new and approved types are put into use on active service, and, when tried and not found wanting, are ordered in large numbers. Only under such conditions can new designs be tried out effectively. Incidentally one is glad to find that the very latest things are not sent over the enemy's lines singly, as was our happy-go-lucky system in the past. It is now possible to tell with reasonable certainty at home whether a sample new machine is worth reproducing in small quantities, and trying out on active service, before ordering it by the thousand.

This excellent system makes imperative the use on active service of a number of different types at once. Three or four types exist in much greater numbers than the others, and as those predominating types die out they are succeeded by newer and improved types. Only thus can a constant supply of new and up-to-date machines be ensured, in accordance with Sir Douglas Haig's desire, expressed in his dispatch last Christmas. Consequently it would be not only unwise but impossible to standardise down to two or three types on active service, as is desired by so many excellent people at home and abroad, who have not sufficiently considered the problems of standardisation and quantity production.—C. G. G.

ESCAPED PRISONERS.

It is reported that two members of a Zeppelin crew have escaped from Stobs internment camp. Their descriptions are as follows:

Wilhelm Heinrich Jensen, naval warrant officer, Zeppelin, aged 38, complexion fair, hair dark, eyes blue, build normal, height 5 ft. 10 in., dress naval uniform.

Max Ammerlich, naval petty officer, Zeppelin, aged 29, complexion fresh, hair dark, eyes brown, build normal, height 5 ft. 11½ in., dress naval uniform.

Scotland Yard reports the escape from the Prisoners of War Camp, Holyport, Maidenhead, of two German officers, both flying men, whose intention is, if possible, to steal an aeroplane and fly back to their own country. Their descriptions are:

Lt. Josef Flink, aged twenty-three, height 6 ft. 1 in., complexion fresh, hair dark brown, eyes dark grey, slight build, dressed in uniform, but may be wearing flannel trousers. Mark gunshot wound, which shows in the palm of the left hand. Speaks very little English.

Orbum Alexander von Scholtz, aged twenty-two, height 6 ft., complexion shallow, hair dark brown, slight build, dressed in uniform, may be wearing flannel trousers. Dark side whiskers. Speaks very little English.

THE INGENIOUS PRESS.

Daily newspapers publish the following amusing report:—

Information has been received which, in a measure, explains the reason for the mysterious visitation of German aeroplanes over Holland and the bombing of Dutch villages on Saturday, August 18th. It would appear that a large squadron of German machines set out with the intention of raiding England, but turned back on reaching the coast owing to bad weather.

As a bombing machine cannot alight without having first disposed of its bombs, the would-be raiders proceeded to get rid of them; to do so over Belgium territory in the occupation of German troops might have resulted in the killing of Germans. They accordingly waited until over Dutch territory, where the possibility of killing was purely one of killing neutrals. Germany's conduct of submarine warfare has demonstrated her attitude towards such an eventuality; but it will be interesting to hear what plea she will put forward in support of this new law of "necessity."

[The explanation would be ingenious were it not for the fact that much of Holland is open country where bombs could be dropped without damaging anyone. The same remark applies to Belgium and the North Sea.—Ed.]

THE DEATH OF A PIONEER.

On August 25th, Harold Barnwell, one of the pioneers of British aviation, was killed in an aeroplane accident at Joyce Green, near Dartford.

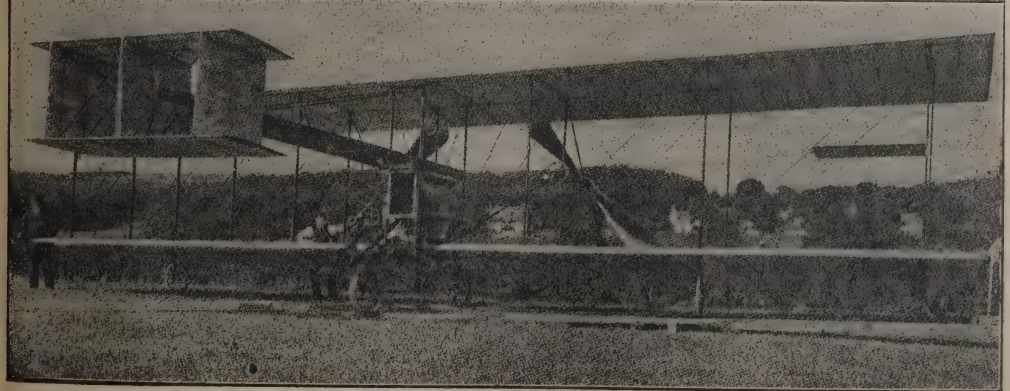
For some time before his death Mr. Barnwell had not been in the best of health, and had had attacks of giddiness. Nevertheless, he went on flying, and flew with all his accustomed skill. On the morning of his death he had flown three machines from Brooklands to Farnborough, and after delivering the third had hurried to Farnborough Station to catch a train to town. He travelled straight through to Dartford, so far as can be ascertained without stopping for lunch.

When he arrived at the aerodrome Captain Barker, R.F.C., was flying a new and very successful experimental machine, of which Mr. Barnwell held a high opinion. After the machine had landed, Mr. Barnwell decided to take it for a short test flight himself. He went up to a height of several thousand feet, made two or three loops, then came down and did a speed test near the ground, and then went up to 2,000 ft. or so and put the machine into a right-hand spin. Nothing abnormal was noticed about the evolution, which the machine had performed before, but instead of flattening out to land the machine went on straight into the ground, and Mr. Barnwell was killed instantly.

Careful examination of the wreckage showed that all the control wires were intact. Captain Barker's evidence at the inquest and Mr. Barnwell's own flying showed that the machine had just previously been in perfect order, so the only possible explanation of the accident seems to be that Mr. Barnwell became giddy or fainted, an explanation which appears to be justified by preceding circumstances.

Mr. Barnwell was buried on August 28th at West Byfleet, his funeral being attended by representatives of the Services, in recognition of the good work done by him in the national interest.

Richard Harold Barnwell was born in London on April 3rd, 1879, and was educated in Scotland. After leaving school he was trained as an engineer at the famous Fairfield Works on the Clyde, and proved to be exceptionally able in all mechanical matters. Long before flying became a practical thing he began experimenting with aeroplanes, and in December, 1908, in partnership with his brother, Frank Barnwell—now Captain R.F.C., and one of our most successful aeroplane designers—he completed at their works at Stirling a monoplane with a double-opposed horizontal engine. The whole machine and its engine were built by the brothers at their own works, which are still flourishing under their original title of the Grampian Motor and Engineering Company. Though the machine did not fly according to modern ideas, it lifted from the ground, and so Harold Barnwell could claim to be the first man to fly in Scotland.



After a series of experiments this type was abandoned, and a big biplane was built of a modified Wright type, and on this Harold Barnwell made a flight of about 80 yards on July 28th, 1909. The machine had a span of 48 ft. and an 8 ft. chord with a 7. ft. 6 in. gap and a 3 in. camber, so that its wing dimensions accorded fairly well with modern ideas. Unlike contemporary biplanes, it had double-surfaced wings, which were covered with oil-proofed silk, and had a Phillips entry. The struts were described as "of torpedo section," and the stays "consisted of steel tape in order to reduce air resistance."

The engine was a 4 in. Tourist Trophy Humber, weighing complete 460 lbs., and it drove two propellers, 10 ft. diam. by 10 ft. pitch, by means of chains. These propellers also were built in the Grampian Motor and Engineering Co.'s works. Small stabilising planes were fitted, Curtiss fashion, between the wing tips. The total weight of the machine was about 14 cwt. without the pilot. Longitudinal control was effected by a biplane cellule elevator carried on two long fore and aft girders.

The first flight ended in a smash, without serious damage to the pilot. The machine was then repaired, and another flight was made on September 10th, 1909, which also ended in a smash, and convinced the makers of the machine that some kind of tail control was necessary.

Some time afterwards Harold Barnwell came to England to learn to fly, and joined the Bristol School. He took his certificate (No. 278, dated September 3rd, 1912) on a Bristol at Brooklands, and soon became known as a singularly skilful pilot. Later on he joined Captain Wood—as he then was—of Vickers Ltd., and took charge of the Vickers School at Brooklands.

As an instructor and school manager, few, if any, aviators have equalled Harold Barnwell, for his ability to impart knowledge was aided by a marvellously equable temper and a goodness of heart which endeared him to all his pupils. I doubt if anyone has ever seen Harold Barnwell really angry, and, though none suffered fools less gladly than he, a slight hint of boredom with

The Barnwell Biplane. Built at Stirling in 1908-09

their presence was the only mark of his displeasure which they ever perceived. Only on his intimate personal friends did Harold Barnwell ever let loose in argument the wealth of invective—and that of a highly literary character—of which he was capable. And then it was a pleasure to hear him, even to the victim of his scorn.

At the Vickers School Harold Barnwell taught the practice of aviation to many of the most notable pilots of the day, most of whom now hold high rank in the Services. He also made a practice of flying any other makes of machines when opportunity offered, so that his experience as a test pilot was of the highest value. Whether flying an old box-kite, a gun-carrier, a Sopwith tabloid, the big Martinsyde monoplane, or the various Vickers experimental machines, his skill and judgment were equally evident. Few will forget his great race on the Martinsyde with the late Gustav Hamel on his racing Morane in the "Circuit of London," when he was only beaten by seconds over the long course.

After the outbreak of war he moved to the Vickers Aerodrome at Joyce Green, and continued to test machines of all sorts. Many were his adventures with experimental machines, both at the aerodrome and on cross-country flights, but in spite of several narrow escapes, including an unintentional loop on a two-ton fighting machine, which finished the loop on the ground, he never came to serious harm.

Besides testing, he did a certain amount of designing, and the tiny scout which he designed and built at Joyce Green was the fastest machine of its day. For various reasons, sufficient at the time, it was not adopted as a standard Service type, but it displayed so much promise that it was recently arranged that he should take up designing as his chief occupation, and leave the firm's regular testing work to others. Like his brother Frank, he possessed exceptional ability as a designer, and his untimely death will undoubtedly deprive the Services of many valuable improvements in aeroplane design.

If Harold Barnwell had been possessed of any particular ambition, there is no telling to what high position his natural abilities might have carried him, but he was obsessed by an invincible contentment with his lot, and could not be induced to struggle with his fellows in the race for what is commonly supposed to be success in life. Which was just as well for the other competitors, albeit a loss to aeronautical progress.

For all his pioneer work and his great skill as an engineer and a pilot, he was known to few, except those with whom his daily work brought him in contact. The daily news-sheets, with that inaccuracy of statement for which they are famous, have said that "before the war" he was "a well-known figure at flying competitions and displays." Never was a description more false, for Harold Barnwell was a gentleman of the old school, and nothing less like a well-known figure or an habitual participator in public displays can be imagined. Fame, notoriety, publicity, call it what you will, were hateful to his shy and proud disposition, and when in the course of his employers' business he had to fly in public he expended successfully considerable ingenuity in avoiding the clutches of Press photographers, with the result that not one likeness of him exists.

He flew because he liked flying, and because he wanted to know more about aeronautics, though, being possessed of a comfortable income, he had no need to fly for a living. He was entirely a fatalist, and for that reason he flew cheerfully under conditions which would have stopped others from flying. Of late he had frequently expressed the conviction that he was going to be killed before long, but the foreboding did not seem to depress him at all. He seemed merely to accept it as a fact which could not be helped, and he thought it was not worth worrying about anyway.

There were those who thought otherwise, and he sought him to exercise more care as to when, where and what he flew, for though his skill was as great as ever he had reached an age when a man is not physically suited to be the pilot of the fastest and most tricky machines. Also, his great experience and ability made him of far greater value on the ground than in the air. And, moreover, though his retiring nature prevented him from being what is usually known as popular, he had acquired, without seeking, a number of friends to whom he had endeared himself deeply, and they were firmly of the opinion that his safety was well worth consideration.

However, he died as he expected to die, in the course of the duty he had laid down for himself—namely, the acquisition of knowledge for the improvement of aeroplanes. He desired that knowledge for the common good and not for his own advancement or profit. Others who have died in acquiring knowledge for the benefit of humanity have been canonised as the martyrs of science. Among them none is more worthy to hold an honoured place than is Harold Barnwell.—C. G. G.

AIR RAID WARNINGS.

It is notified for the information of the public that in the event of enemy aircraft being likely to approach London by daylight warning will be given in the L.C.C. fire brigade and county area by the discharge of two one-pound naval explosive rockets, with an interval of 15 seconds between, from the look-out towers of the following fire stations:—

In the West End District.—From the stations at Manchester Square, Westminster, Knightsbridge, Brompton, Fulham, Hammersmith, North Kensington, Belsize (St. John's Wood), Hampstead, Shepherd's Bush, Bayswater, and Kilburn.

In the Central and North London Districts.—From the stations at Clerkenwell, Caledonian Road, Highbury, Great Marlborough Street, Euston, Kentish Town, Hornsey Rise, Hornsey, and Brunswick Road.

In the North-Eastern and Eastern Districts.—From Stoke Newington, Bow, Millwall, Poplar, Kingsland, Shadwell, Bethnal Green, Shoreditch, and Bishopsgate.

In the South-Eastern District.—From New Cross, Deptford, Woolwich, Greenwich, Shooter's Hill, Charlton, Lewisham, Dulwich, Peckham Road, Lee Green, Perry Vale, Eltham, Plumstead, and Cherry Garden station, Rotherhithe.

In the South-Western and Southern Districts.—From Clapham, Old Kent Road, West Norwood, Brixton, Tooting, Kennington, Wandsworth, Battersea, Streatham, Vauxhall, Waterloo Road, and Tooley Street.

Signals will also be fired from Scotland Yard, from the Blackfriars Bridge river float station, and from police stations outside the fire brigade area, but within 10 miles of Charing Cross.

THE MOSAIC LAW.

At a meeting of the Southend Town Council on August 21 a resolution was passed calling on the Government to state plainly whether or not they intend to take the necessary action to inflict reprisals on German civilians for air raids, and, if the answer is in the affirmative, to give an assurance that the engineering of the scheme of reprisals will leave little room for doubt that German civilians shall suffer to as great an extent as civilians in England have suffered.

[Anyhow, we have now got rid of some of our hypocrisy, and have evidently come back to the good old Mosaic Law.—Ed.]

AIR RAID RESULTS.

Below is a list of properly organised raids by enemy aeroplanes during the year. Sporadic raids by single machines, and a few not in regular formation, are omitted. The details are as follows:—

Date.	Locality.	Number of Raiders.	Brought down.	Casualties. Killed.	Injured.
May 25	Folkestone	16	3	76	174
June 5	Medway	18	10	12	38
June 13	London	15	—	157	432
July 4	Harwich	12-14	2	11	29
July 7	London and Isle of Thanet	20	4	37	145
July 22	Harwich and Felixstowe	15-21	1	11	29
Aug. 13	Southend	16	1	32	47
Aug. 22	Kent	10	2	11	19

IN DEFENCE OF GOVERNMENT OFFICES.

BY "BERKELEY."

There are more than one point of view in every question. The terms "right" and "wrong" can be qualified until no vestige of original meaning is left to gladden the debater or the seeker after truth. One is so prone to ignore all things that do not support one's own view that the other side to a question is lost in obscurity.

Eve is commonly held up to reprobation for her part in the incident, or series of incidents, which led to the exclusion of her husband and herself from the primeval earthly paradise and its langorous security. Her view has received little attention. So little, in fact, that only her accusation of temptation by the man Adam has survived in evidences.

Perhaps, if one knew the truth, it would appear that Adam, suffering intensely from ennui, owing to constant inaction of his guarded life, to which no gilded vice gave vivid relief, became unbearable to his adorable and unsophisticated wife. She, that pleasure might return again to his days, sought for amusements previously unknown in Eden. The result of her action is known to the world.

Such might be her side of the story. Yet an unbelieving world imputes to her the entire blame, and gives her no credit for the increase of production of the passing ages.

A Regrettable Incident.

Later in the tale of history one Guido Foulkes, or Fawkes, attempted to remove the Houses of Parliament and their human contents by means of an explosion of gunpowder. The attempt failed, and Guy Fawkes is remembered by all true Englishmen with feelings of sorrowful regret.

Here again one is too ready to impute a virtuous intention to him without considering the point of view proper to the members of the two Houses concerned. They also were doing their duty as seemed best to them. If they did no good, at least they did but little harm. Kill them, and they would of necessity be replaced immediately by others equally futile, equally verbose.

And so throughout all time there are at least two sides to everything, two views in every case. Each murderer can support his action by some reason, however inadequate it may be. Consequently a Government department possessing few friends among the people has a case to present if only public propriety permitted a reply to attacks.

A Case in Point.

The columns of this print have been largely devoted during the past few years to a series of direct attacks on certain Government departments connected with the design and output of aircraft. Aeronautics was a new science, and its military application involved changes and developments in other arms of the King's Services in addition to modifications in the design and material of the aircraft supplied for Government use. None knew very much as to the intricacies of the new science, and such knowledge was practically non-existent in either the War Office or the Admiralty.

The class of man who had entered the ranks of the new industry was rarely suitable for appointment either to the Civil Service or to commissioned rank in the Army or Navy. Hence it became necessary to form new departments from people, already in Government employ, who were possessed of such training as would permit their ready acquisition of such knowledge as was available, supplemented by suitable additions from outside sources.

Shifting the Blame.

There is little question that many bad selections were made, and that, as is commonly the case in the genesis of a new subject, innumerable mistakes were made, some being of high moment. The lack of preparation at the beginning of the war is a thing apart, and can in no way be blamed on the departments concerned or on the responsible officers commanding the aerial arms of the two Services. Inadequate supplies and a shortage of money must be laid to the charge of the executive government itself. The blame is invariably misplaced in these matters.

At the beginning of the present war the allowance of machine-guns to each battalion, as shown in establishments, was very low. The Germans, on the other hand, had equipped each infantry battalion with sixteen machine-guns of the latest pattern, and had trained exhaustively a large and efficient personnel in the tactical use of these weapons.

As a result, the casualties to British troops in the early stages of the war were unreasonably high when considered in relation to the numbers of the troops by which they were caused. Also, victory was denied us on many occasions, when tactical dispositions had given us the advantage, because the enemy possessed and made effective use of many machine-guns.

This shortage of machine-guns in our Army was again held as an offence of the War Office. The antiquated methods of that department were held up to ridicule.

Those Politicians.

But not a word was said as to the sins of the politicians who had for years refused the just demands of the responsible soldiers, because, forsooth, all increase of material would cost money, and fresh expenditure would send up national taxation, with a consequent increase of annoyance in the country. For years an increased establishment of machine-guns had been recommended, and for years it had been refused. The English Army was only intended for the decimation of savage races, and the existing preparations were adequate for that purpose!

So, too, in the case of mechanical transport and in that of the supply of horses. The departments might recommend, but the politician was afraid of his democratic supporters, to whom Old Age Pensions are a greater boon than national security, and the union of labour a more pleasing thing than an efficient measure of national defence.

The Defenceless Department.

The politician can defend himself, and the Service department cannot. Even on those occasions when the politician finds it necessary to answer charges in the House of Commons directed against any Government office, it happens frequently that a real defence is impossible owing to the risk of assisting the enemy by making the necessary revelations. Thus the unfortunate department, weakly defended, falls into greater disrepute than before.

There is a great charm to some people in a comparison between the amazing efficiency of a successful business house and the historic ineptitude of any office under Government control. It is so easy to speak of the enormous dividends issued by firms selling petrol or acting as universal providers of everything from hair-curlers to dinner guests. Compared with the constant unreturnable expenditure of officialdom, the glow of life is ever with the homes of petty business.

"Bithneth ith Bithneth."

A business house depends for its success on the sale of its goods. Its policy is largely indicated by the demands of the public. If the sale of elephants declines, the stock need not be replenished, and the money thereby saved can be devoted to an increase in the stock of perambulators, which may be in greater demand.

The efficiency of the employees in a business house is ensured by their individual keenness to make money and to progress in life. A Government official, if he effects a deal involving the expenditure of four or five millions of pounds, which in effect saves the country an enormous amount of annual expenditure, receives no personal advantage either in money or position.

He cannot be paid, as he is simply an honourable gentleman doing his duty in the proper manner. He cannot be promoted because over him are others who by longer service have earned their place in the world, and who have perhaps been denied the opportunity of completing an act of brilliancy.

Accessory Effects.

Again any business house, however vast may be its ramifications, is never so large as to prevent complete knowledge of the conditions affecting each bargain or sale. There are no correlated factors which complicate the decision. When they order a number of steam ploughs it is not necessary for them to consider whether such an order will reduce the number of motor-cars to be supplied in the immediate future.

In the case of a Government department, every act they carry out affects to a greater or lesser degree a number of other departments, and in the preliminary enquiry it is necessary to take all these conflicting factors into account.

The Case of Machinery.

For instance, one often hears of an application made by a firm undertaking the manufacture of munitions of war for permission to purchase additional machinery which is known to be in existence in the premises of another firm situated at no great distance from the applicant. The application is held up for days, though no other disposition is made of the idle machinery. The finger of scorn is pointed at the department which has by its apparent ineptitude caused needless delay.

A little reflection will, however, indicate the department's reasons for delay. It is possible and probable that the machine lying ready for delivery is of a nature suitable for use in industries controlled by other branches of the Government, and may have already been earmarked or allocated for issue to another firm.

That no confusion of effort may arise, a minute has to be sent round to these other departments in order that their views may be obtained as to the relative value of the different claims for the use of the machinery.

Each department is probably dealing with hundreds of questions daily, and is constantly making decisions covering not only the expenditure of millions of pounds but the wasting or saving of thousands of lives in the field. Is it extraordinary that a little time should be taken in the consideration of such matters?

Prevailing Amateurism.

Mistakes are made in innumerable cases, and a suffering public is not permitted to miss any of the horrors of mismanagement. The daily Press makes certain that all mistakes shall be magnified and imputed to the wrong causes. But on how many occasions is the public told of the constant tale of efficiency and of the unending successes made in spite of a prevailing amateurism.

Pages and pages could be covered with instances proving the hidden virtues of the much-abused Government official and of the mistakes of the critics. It would serve no good purpose so to blacken the pages of this journal, firstly because it would interest nobody, and secondly because none would believe the statements made therein.

The belief in the inefficiency of our permanent Government is too deeply ingrained for any well-balanced platitudes to make any alteration of value in public opinion. But, when cursing the official, spare one kindly thought for his good intentions, without which Hell would be denied its smooth and perfect floor.

Epilogue.

[My dear Berkeley,—I quite agree with you. Permit me to remind you that the people whom I have always cursed are not the real sailors and soldiers and Civil Servants, but the politicians—in and out of uniform.—Ed.]

Accidents in Home Service Flying.

There seems to be at present considerable uneasiness among many people on account of the number of fatal accidents reported in the daily Press as happening to aviators on home service. It is, unfortunately, impossible in war-time to publish figures showing the number of fatal accidents in proportion to the number of pilots flying and the number of miles flown, but if it were possible to publish those figures that uneasiness would disappear.

Accidents among those at home occur to three classes of aviators: (a) those in training, including instructors, pupils just learning to fly, advanced pupils, and pupils at fighting schools; (b) Home Defence pilots, and (c) active service pilots with squadrons preparing to go abroad.

The majority of the accidents occur in class (a). It is inevitable that under the necessary intensified training of war-time there should be a slight increase in accidents owing to pupils being pushed forward more quickly than they would be in peace time. Such accidents are as inevitable as are mental breakdowns among youngsters cramming for exams. These accidents are caused by pupils losing their heads at critical moments through inexperience, and sometimes by sheer stupidity. Sometimes a pupil only kills himself, sometimes he kills his instructor as well.

Accidents among advanced pupils are less frequent, and are as a rule true unavoidable accidents, through engine failure at inopportune moments, or through sudden changes in weather such as a quickly rising storm or an unexpected fog. Accidents at fighting schools are still less frequent.

Class (b) accidents happen as a rule through landing in the dark or in morning or evening fogs when practising, and sometimes after a flight in search of enemy aircraft.

Class (c) accidents are probably the least frequent of all, and, one imagines, are caused either by collisions, carelessness in flying when "stunting" near the ground, or by machines breaking in the air when flying for practice.

The system of training is now so skilfully graduated, despite the urgent demand for pilots, that very few undue risks are taken. Here and there a local C.O. may demand too much of his pupils and instructors, and so may cause a few extra accidents, especially when he is himself pressed to supply a certain number of pilots during a spell of bad weather, but it may be taken as a fact that every possible care is exercised to avoid such accidents. In any case the number of fatalities is astonishingly small in proportion to the number of pilots and their mileage, though the majority of the net total must necessarily be among pupils.

The really avoidable accidents are chiefly caused by young and exuberant pilots showing off, or "stunting," for the admiration of their friends. One can have but little regret for those killed from such a cause.

Some other avoidable accidents are caused through bad workmanship either in new or repaired machines. None can forgive those who are responsible for such accidents and one hopes that if convicted they are dealt with sufficiently severely.

There is, however, still a feeling that of those accidents which continue to occur on R.E.8s. some are avoidable. There is, for instance, no excuse for spars breaking in the air, nor for engines setting fire to the machines, either on or off the ground, and it would seem that such happenings are not so uncommon as they should be. It is well that these accidents should be studied still more closely.

Apart from these specified causes of accidents, one may rest assured that, considering all the high pressure of war-time training, the number of fatalities is not disturbingly high, and it would not be surprising to find, if one could take a percentage of accidents to the numbers of pilots and their mileage, that the proportion is actually considerably lower than it was before the war.—C. G. G.

Fellowes, Spec. Res.; Lt. W. Buckingham, M.C., Spec. Res., July 31st. Lt. A. H. Vinson, Spec. Res.; Sec. Lt. C. Musgrave, Spec. Res., Aug. 1st. Sec. Lt. (temp. Lt.) G. K. Macdonald, Notts and Derby R., Spec. Res.; Lt. W. S. Shirtcliffe, Spec. Res.; Sec. Lt. C. N. Russell, Spec. Res., Aug. 2nd.

Equip. Officers, 1st Cl.—And to be temp. Capts. whilst so empld. :—Lt. L. W. W. Lees, R.G.A., Spec. Res., from Staff Lt.; Temp. Sec. Lt. S. R. Axford, Gen. List, from the 3rd Cl., Aug. 1st.

* * *

The following are among the decorations and medals awarded by the Allied Powers at various dates to the British Forces for distinguished services rendered during the course of the campaign. The King has given unrestricted permission in all cases to wear the decorations and medals in question.

PRESENTED BY THE PRESIDENT OF THE FRENCH REPUBLIC.

Legion d'Honneur.

Croix d'Officier.

Brev. Lt.-Col. Duncan Sayre MacInnes, C. M. G., D.S.O., R.E.
Brev. Lt.-Col. Duncan Le Geyt Pitcher, Indian Army.

Croix de Chevalier.

Maj. John Laurence Baird, C.M.G., D.S.O., Yeomanry.
Temp. Lt.-Col. William Dawson Beatty, Royal Engineers.
Col. (temp. Brig.-Gen.) Walter Buckingham Caddell, R.A.
Temp. Hon. Col. John Dewar Cormack, C.M.G.
Actg. Maj. William Middleship Cooper, M.C., R.A.
Brev. Lt.-Col. John Tuthill Dreyer, D.S.O., R.A.

War Office, August 23rd.

REGULAR FORCES.—N.C.O., to be temp. Sec. Lt. :—

Memorandum.—For duty with R.F.C.—Sgt. C. H. N. Nunn, from R.F.C., July 2nd.

Establishments.—R.F.C.—Mil. Wing.—Sqdn. Comdrs.—From Flt. Comdrs., and to be temp. Majs. whilst so empld. :—Sec. Lt. (temp. Capt.) E. M. Pollard, W. York. R., T.F., March 16th. Sec. Lt. (temp. Capt.) R. H. Peck, E. Surr. R., Aug. 1st. Temp. Capt. W. D. Long, Gen. List, Aug. 2nd. Capt. T. W. Mulcahy-Morgan, R. Ir. Fus., Aug. 7th. Capt. (temp. Lt.-Col.) E. N. Fuller, Spec. Res., to revert from a Wing Comdr., to relinquish his temp. rank and to be temp. Maj. whilst so empld., Aug. 4th, seny. Sept. 5th, 1915.

Flt. Comdrs.—Capt. K. B. Harbord, R.A., from a Staff Officer, 2nd Cl. (graded as a Brig.-Maj.), School of Aerial Gunnery, July 16th. From Flying Officers, and to be temp. Capts. whilst so empld. :—Sec. Lt. (temp. Lt.) C. Butler, R.E., T.F.; temp. Lt. H. G. Smart, Gen. List; Sec. Lt. J. Manley, Spec. Res., July 23rd. Lt. A. W. Kilgour, Spec. Res. (since killed), July 26th. Temp. Lt. A. C. Jowett, Gen. List; temp. Lt. S. W. Thompson, Gen. List; Lt. G. E. F. Sutton, M.C., Canadian Local Forces; Lt. E. Cameron, Yeo., T.F.; temp. Lt. J. A. Slater, Gen. List; Lt. E. J. Watkins, Spec. Res.; temp. Sec. Lt. R. W. Chappell, Gen. List, July 27th. Lt. J. Whittaker, E. Lan. R., T.F.; Sec. Lt. (temp. Lt.) A. G. Taylor, Yeo., T.F.; temp. Lt. J. H. Metcalf, Gen. List; Lt. G. J. Harter, Spec. Res.; temp. Lt. J. L. Trollope, Gen. List, July 28th. Temp. Lt. L. S. Weedon, Gen. List, Aug. 6th. Sec. Lt. C. S. O'Grady, Spec. Res., Aug. 11th.

Equipment Officers, 1st Cl.—And to be temp. Capts. whilst so empld. :—Lt. L. E. Palmer, York. and Lanc. R., from an Equipment Officer, 3rd Cl., June 11th. Sec. Lt. (temp. Lt.) L. V. Drake, Yeo., T.F., from an Asst. Inspr. (graded as an Equipment Officer, 2nd Cl.), School of Mil. Aeronautics, and to be temp. Capt. whilst so empld., July 1st. Sec. Lt. (temp. Lt.) H. E. Jarman, Spec. Res., from an Asst. Instr. (graded as an Equipment Officer, 2nd Cl.), School of Mil. Aeronautics, July 11th.

Gen. List.—Sgt. W. Lienard, from R.F.C., to be temp. Sec. Lt., Aug. 24th.

War Office, August 24th.

REGULAR FORCES—Establishments.—R.F.C.—Mil. Wing.—Flt. Comdrs.—From Flying Officers, and to be temp. Capt. whilst so empld. :—Temp. Lt. W. St. J. Scott-Scott, Gen. List (August 8th); Lt. N. H. Read, Spec. Res., August 10th.

Equip. Officers, 1st Cl.—Temp. Lt. P. Worthington, M.C., Gen. List, from a Balloon Comdr. (graded as a Balloon Officer), and to be temp. Capt. whilst so empld., August 1st.

Gen. List.—Flt. Sgt. G. G. L. Blake, from R.F.C., to be temp. Sec. Lt., July 17th. To be temp. Sec. Lts. (on prob.) :—H. T. Kingsley, late temp. Sec. Lt., Worc. R.; H. A. Lyford, August 24th.

Schools of Instr.—School of Aerial Gunnery.—Comdt.—(Graded as a Depot Comdr.)—Temp. Lt. (temp. Maj.) G. R. Moser, Arg. and Suthd. Highrs., from a spec. appt. (graded as a Park Comdr.), and to retain his temp. rank while so empld., August 1st.

KINDLY MENTION "THE AEROPLANE" WHEN CORRESPONDING WITH ADVERTISERS.

The King has been pleased, by Letters Patent under the Great Seal, to create and institute an Order of Knighthood to be styled "The Most Excellent Order of the British Empire."

The Order follows in most respects the precedents of other Orders of Knighthood, but it will consist of five classes, and will be given to women as well as men. The first two classes will, in the case of men, carry the honour of Knighthood, and in the case of women the privilege of prefixing the title "Dame" to their names. The Five Classes of the Order are as follows:—

MEN.

1. Knights Grand Cross (G.B.E.). 2. Knights Commanders (K.B.E.). 3. Commanders (C.B.E.). 4. Officers (O.B.E.). 5. Members (M.B.E.).

WOMEN.

1. Dames Grand Cross (G.B.E.) 2. Dames Commanders (D.B.E.). 3. Commanders (C.B.E.). 4. Officers (O.B.E.). 5. Members (M.B.E.).

The Badge of the Order, worn by the members of the 1st, 2nd, and 3rd Classes, takes the shape of a silver gilt cross, enamelled pearl grey, in the centre of which, in a circle enamelled crimson, is a representation of Britannia seated. The circle contains the motto of the Order, "For God and the Empire."

The Star, worn by members of the first two classes, is an eight-pointed silver star, the centre of which bears the same device as the Badge.

The treatment of the Badge for the 4th Class is similar to that for the 1st, 2nd, and 3rd Classes, except that it is smaller and is not enamelled. In the case of the 5th Class the Badge is of silver instead of silver gilt.

A Silver Medal of the Order has been struck and will be awarded to those persons, not being members of the Order, whose services to the Empire warrant such recognition.

As in the case of other Orders, the members will have the privilege of placing the initials (above indicated) after their names.

The Chancery of the Order will be at the Central Chancery of the Orders of Knighthood, St. James's Palace.

THE ORDER OF THE BRITISH EMPIRE.

[The King has been pleased to Command, as Sovereign of the Most Excellent Order of the British Empire, that the following persons concerned with aeronautics shall be admitted to the Order in the classes mentioned] :—

KNIGHT GRAND CROSS.

Lord Sydenham, G.C.M.G., etc.—Has rendered special services in connection with the Air Board and also as Chairman of a Royal Commission on Public Health.

KNIGHTS COMMANDERS.

Herbert Austin, Esq.—Has rendered valuable services in the production of the Munitions of War.

Dugald Clerk, Esq.—Member of the Panel of Board of Invention and Research, Admiralty, Member of the Ministry of Munitions Inventions Department, Member of the Trench Warfare Advisory Panel.

Alfred Edward Herbert, Esq.—Deputy Director-General in charge of the Machine Tool Division and Chairman of the Machine Tool Committee, Ministry of Munitions.

COMMANDERS.

Leonard Bairstow, Esq., F.R.S.—Chief of Aero-dynamics Department, National Physical Laboratory.

Charles William Bryant, Esq.—Managing Director of Brotherhoods (Limited.)

Lieut.-Col. Henry Fowler.—Late Director in the Gun Ammunition Division, Ministry of Munitions.

Percy John Pybus, Esq.—Has rendered valuable services to the Labour Supply Department of the Ministry of Munitions.

MEMBER.

Russell Clarke, Esq.—Aviation Electrician, Telegraphist, etc., Admiralty.

WAR OFFICE, August 25th.

REGULAR FORCES.—STAFF.—ATTACHED TO HEADQUARTER UNITS.—Capt. J. R. W. Grove, R. Dub. Fus., from a Balloon Officer, and to remain secd., vice Maj. M. R. W. Foster, Hamps. R., August 10th, 1917.

ESTABLISHMENTS.—R.F.C.—MIL. WING.—Sqdn. Comdr.—Sec. Lt. (temp. Capt.) W. R. Snow, M.C., Spec. Res., from a Flt. Comdr., and to be temp. Maj. whilst so empld., August 16th.

Special Appt.—(Graded as a Sqdn. Comdr.).—Lt. (temp. Lt.-Col.) H. E. Chaney, Lan. Fus., from Comdt. of a School of Aerial Gunnery (graded as a Depot Comdr.), to relinquish his temp. rank, and to be temp. Maj. whilst so empld., August 1st.

Flt. Comdr.—Sec. Lt. (temp. Lt.) W. R. B. McBain, R.F.A., T.F., from a Flying Officer, and to be temp. Capt. whilst so empld., July 26th.

Adjts.—Capt. E. C. Perrin, Ches. R., T.F., from a Flying Officer (observer), May 17th. Sec. Lt. C. H. Bell, Spec. Res., from a Flying Officer, and to be temp. Capt. (without the pay and allowances of that rank) while so empld., August 9th.

Equip. Officers, 1st Cl.—Lt. V. F. P. Bryce, Spec. Res., from the 2nd Cl., and to be temp. Capt. while so empld., May 14th.

Special Appts.—(Graded as Equip. Officers, 1st Cl.).—Lt. (temp. Capt.) V. F. P. Bryce, Spec. Res., from an Equip. Officer, 1st Cl., and to retain his temp. rank while so empld., June 22nd. Lt. F. D. Maclean, R.A., from an Equip. Officer, 3rd Cl., and to be temp. Capt. while so empld., July 5th. The appt. of Lt. V. F. P. Bryce, Spec. Res., notified in the "Gazette" of August 11th, is cancelled.

REGULAR FORCES.—OVERSEAS CONTINGENT.—Temp. Capt. C. E. B. Corbould is secd. for duty with the R.F.C., Jan. 31st.

* * *

The King has been pleased to approve of the appointment of the following Officer to be a Companion of the Distinguished Service Order in recognition of his gallantry and devotion to duty in the Field:—

Temp. Lt. Fred Parkinson Holliday, Gen. List and R.F.C.

By his initiative and skilful manœuvring he led six hostile machines to an encounter with our own formation, during which five out of the six hostile machines were destroyed and driven down. He had been equally successful the day before in misleading hostile aircraft, and his originality and fearless example were of the greatest value to his squadron.

* * *

The King has been pleased to award a Bar to the Military Cross to the following Officer:—

Temp. Capt. Anthony Herbert William Wall, M.C., Midd'x R. and R.F.C.

By his initiative and skilful manœuvring he led six hostile machines to an encounter with our own formation, during which five out of the six hostile machines were destroyed and driven down. He had been equally successful the day before in misleading hostile aircraft, and his originality and fearless example were of the greatest value to his squadron. (M.C. gazetted July 18th, 1917.)

* * *

The King has been pleased to confer the Military Cross on the following Officers in recognition of their gallantry and devotion to duty in the Field:—

Sec. Lt. (Temp. Capt.) Brian Edmund Baker, Rif. Bde., and R.F.C.

He led his patrol with great skill against a hostile formation which he attacked, accounting for five enemy machines out of six. Later, he drove a hostile machine down in flames, and attacked and destroyed another one by diving 7,000 ft. on it and firing at such close range as to nearly collide with it. His gallantry has been at all times of great value to his squadron.

Sec. Lt. Leonard Monteagle Barlow, R.F.C., Spec. Res.

For conspicuous gallantry and devotion to duty when engaged in aerial combats. He has set a very fine example of courage and dash in attacking and destroying hostile machines. He also attacked and stopped a goods train, silenced a machine gun on an enemy aerodrome, and dispersed troops on the road from a very low altitude.

Lt. Geoffrey Sebastian Buck, Lond. R. and R.F.C.

He has taken part in many offensive patrols and has brought down 17, frequently attacking hostile troops on the ground. He has also successfully attacked and destroyed hostile aircraft on several occasions, setting a fine example of dash and determination.

Temp. Sec. Lt. Thomas Carlyon Luke, R.E. and R.F.C.

For conspicuous gallantry and devotion to duty in aerial combats. On several occasions he attacked hostile formations and dispersed them, although they were in superior numbers, showing great dash and fearlessness in engaging them at close range. He has taken part in 35 offensive patrols, at all times setting a fine example of courage and devotion to duty.

Capt. George de Chierri Pirie, Sco. Rif., Spec. Res. and R.F.C.

He has done exceptionally fine artillery work on two occasions whilst carrying out a shoot. He was attacked by hostile scouts in superior numbers, whom he dispersed, and then completed his work. On another occasion when by his means the artillery had knocked out three guns of a hostile battery, he descended to a low altitude and prevented the removal of the remaining gun, by dispersing the enemy with his machine-gun.

Sec. Lt. (Temp. Lt.) Lionel Mostyn Woodhouse, Yeo. and R.F.C.

His work whilst observing for artillery has been of the greatest value. During one month of observation he has been responsible for the destruction of 13 emplacements and for causing a large number of explosions and fires.

* * *

The King has been pleased to approve of the award of the Distinguished Conduct Medal to the following Man for acts of gallantry and devotion to duty in the Field:—

7420 1st Cl. Air Mech. C. M. Reynolds, R.F.C.

"The A.G.S. Book"

By BERNARD ISAAC.
130 Pages. Over 230 Illustrations.

AN IMPORTANT WORK of REFERENCE FOR THE AIRCRAFT INDUSTRY AND THE AIR SERVICES.

CONTENTS.

CHARTS of A.G.S. Rafwires, Tie Rods and Joints, Nuts, Bolts, etc., covering extracts from 82 blue prints—Metric Equivalent Charts—Numerical List of A.G.S. Parts — Alphabetical List of A.G.S. Parts—A.G.S. and other Screw Thread Systems—A.G.S. Standard for Bolt Heads and Nuts — Photographs, Drawings and Dimensions of all important A.G.S. Parts—A.G.S. Fits and Limits — Test Pieces — Articles on "Standardization of Aircraft Parts" and "Accelerating Aircraft Output"—Chart of Admiralty Strainers—Illustrations of R.A.F. and other Aircraft Parts, etc., etc., etc.

THE "A.G.S. BOOK" is issued to approved applications from the Air Services and the Aircraft Industry. Persons connected with the Aircraft Industry should make application through their firms. Applications from the Air Services should be made through the Commanding Officer. One copy is supplied **free** to each firm, and additional copies may be obtained at 2/6 each, the whole of the proceeds, without deduction, being given to The Royal Aero Club Flying Services Fund.

APPLICATIONS must be made on the special forms which may be had from The Aircraft Supplies Co., Ltd., 166, PICCADILLY, LONDON, W.1.

War Office, August 27th.

REGULAR FORCES.—The following N.C.O.'s and men to be Sec. Lts. for service in the Field :—

Memoranda.—For duty with R.F.C. :—1st Cl. Air Mech. E. A. Clear, from R.F.C., April 28th. Cpl. G. O. Lowe, from S.A., R.F.C.; 1st Cl. Air Mech. H. Spencer, from S.A., R.F.A.; and Cl. Air Mech. C. W. G. Ratsey, from S.A., R.F.C.; 2nd Cl. Air Mech. A. K. Prentice, from S.A., R.F.C.; Cpl. C. J. Thomson, from S.A., R.F.C.

Establishments.—R.F.C.—Mil. Wing.—Wing Comdr. :—Capt. (temp. Maj.) D. L. Allen, R. Ir. Fus., from a Sqdn. Comdr., and to be temp. Lt.-Col. whilst so empld., July 1st.

Flt. Comdr.—Sec. Lt. (temp. Lt.) B. K. B. Barber, North'd Fus., from a Flying Officer, and to be temp. Capt. whilst so empld., August 10th.

Balloon Officer.—Sec. Lt. (temp. Capt.) B. H. Sisson, R.G.A., Spec. Res., to revert from a Balloon Comdr. (graded as a Flt. Comdr.), to relinquish his temp. rank and to be temp. Lt. whilst so empld., August 12th, 1917, with seniority from March 10th, 1916.

Equipment Officers, 1st Cl.—Qr.-Mr and Hon. Lt. (temp. Lt.) D. McBirney, R.F.C., from the 2nd Cl., and to be temp. Capt. whilst so empld., August 1st.

Gen. List.—To be temp. Sec. Lts. :—2nd Cl. Air Mech. S. Curzon, from R.F.C.; Sgt. F. R. Assinder, from R.F.C.

Memorandum.—Temp. Lt. J. S. Ruttle, attd. E. Kent R., to be Actg. Capt. (without the pay and allowances of that rank) whilst empld. as Adjt., R.F.C., Cadet Wing.

OVERSEA CONTINGENTS.—Canada.—Can. Army Dental Corps.—Temp. Capt. W. H. Gilroy is secd. for duty with the R.F.C., April 14th.

NAVAL.

The following appointments have been made in the Royal Naval Air Service :—

August 22nd.—Flt. Lt. (temp.).—R. R. Winder, promoted to Actg. Flt. Comdr. (temp.), seny. July 27th.

Flt. Sub-Lt. (temp.).—E. V. Reid, D.S.C., to be Actg. Flt. Lt. (temp.), seny. July 27th.

Lt. (R.N.V.R.).—N. C. Blanch, granted rank of Flt. Comdr. (temp.), seny. June 30th.

August 27th.—Flt. Sub-Lts., Proby. (Act. Lts., R.N.).—G. R. I. Snow and J. W. Havers, both promoted to Flt. Lts., seny. respectively May 4th and June 19th.

Flt. Lt. (Temp.).—W. M. Alexander to be Act. Flt. Comdr. (temp.), seny. August 3rd.

Flt. Sub-Lt. (Temp.).—D. F. FitzGibbon, to be Act. Flt. Lt. (temp.), seny. August 3rd.

Lts., R.N.V.R. (Temp.).—J. C. Savage and D. A. B. Noble, both to be Act. Lt.-Comdrs., R.N.V.R. (temp.), seny. respectively August 14th and 24th.

Temp. commissions (R.N.V.R.) have been granted to the following, sent as stated :—Lts. M. V. Conant, August 25th. W. Guidott, Sept. 2nd.

Admiralty Communiqués.

August 21st.—At about midnight, August 19th-20th, the Royal Naval Air Service dropped many tons of bombs on Middelkerke dump (south-west of Ostend) and on Brugeoise works.

All machines returned safely.

August 22nd.—A portion of our light forces, while operating off the coast of Jutland on the morning of August 21st, engaged and destroyed an enemy Zeppelin.

There were no survivors.

In amplification of Lord French's report issued earlier to-day, 10 enemy aeroplanes of the Gotha type were attacked by Naval aeroplanes in the vicinity of Ramsgate between 10 and 11 a.m. to-day.

The enemy machines, which were flying at a height of between 11,000 and 12,000 feet, were closely engaged, and in addition to the two mentioned by Lord French in his earlier communiqué, another was shot down by R.N.A.S. machines close to the coast. The remaining seven Gothas returned to seaward, followed by numerous Naval aircraft.

The pilot of an R.N.A.S. aeroplane, which chased the raiders oversea, reports that after firing 300 rounds of ammunition into one of the enemy machines, both gunners appeared to be killed. There was no fire in reply, even at 20 yards' distance.

As yet no report of the action taken by our aircraft at Dunkirk has been received.

11.50 p.m.—The following report has been received from Vice-Admiral, Dover, relative to the action taken by the Royal Naval Air Service at Dunkirk :—

Several flights of machines were sent out to intercept the enemy aircraft returning from England. One flight of three machines met 12 Gothas 35 miles north of Nieuport and engaged them, chasing them to Zeebrugge, but with no decisive result.

Another of our patrols of 10 machines engaged a flight of about 25 enemy escorting scouts who were off the coast awaiting the return of the enemy bombers, and in the ensuing fight five enemy aircraft were driven down completely out of control and probably some more, but in the close fighting accurate counting was impossible.

All our machines returned safely.

August 23rd.—A bombing raid by naval aircraft was carried out at 3 o'clock yesterday morning (August 22nd) on Zeebrugge Mole, shipping and batteries, some hits being made.

A raid was also made on Ghistelles aerodrome (about 10 miles south-east of Ostend) at 6.30 a.m., August 22nd. Bombs exploded near the western shed and a fire was started.

All machines returned safely.

August 24th.—Early yesterday morning (August 23rd) bombing attacks were carried out by the Royal Naval Air Service on the following military objectives :—

Middelkerke dump (about 10 miles south-west of Ostend).

Ravensyde dump (north-east of Middelkerke).

Houttave aerodrome (about 10 miles north-west of Bruges).

Many tons of bombs were dropped.

All machines and pilots returned safely.

August 27th.—A bombing raid was carried out at midnight August 25th-26th, by the Royal Naval Air Service on St. Denis Westrem aerodrome (south-west of Ghent), in which a large number of bombs were dropped.

One of our machines failed to return.

The Casualty List.

Reported August 22nd.

Missing.—Johnston, Flt. Comdr. P. A., R.N.

Bennetts, Flt. Sub-Lt. E. A., R.N.

Slightly Injured.—Sykes, Proby. Flt. Officer R., R.N.

Reported August 23rd.

Killed.—Glasgow, Flt. Sub-Lt. T. L., R.N.

Cook, Flt. Sub-Lt. C. B., R.N.

Missing.—Hodges, Flt. Sub-Lt. C. R. W., R.N.

Slightly Injured.—Keirstead, Flt. Sub-Lt. R. McN., R.N.

Drowned.—Moore, H. F., Actg. Air Mech., 1st Gde., J.28710.

Ward, H. R., Air Mech., 2nd Gde., F.6276.

Reported August 24th.

Killed.—Holroyd, Proby. Flt. Officer H. S., R.N.

Code, Proby. Flt. Officer L., R.N.

Missing.—Weir, Flt. Sub-Lt. C. H., R.N.

Injured.—Harrison, Sqdn. Comdr. J. I., R.N.

Brown, Flt. Sub-Lt. R. L., R.N.

Reported August 25th.

Killed.—Lewis, Flt. Sub-Lt. F. C., R.N.

Hutty, Obsr. Sub-Lt. A. I., R.N.

Wyatt, Flt. Lt. C. J., R.N.

Missing.—Lowther, Flt. Sub-Lt. C., R.N.

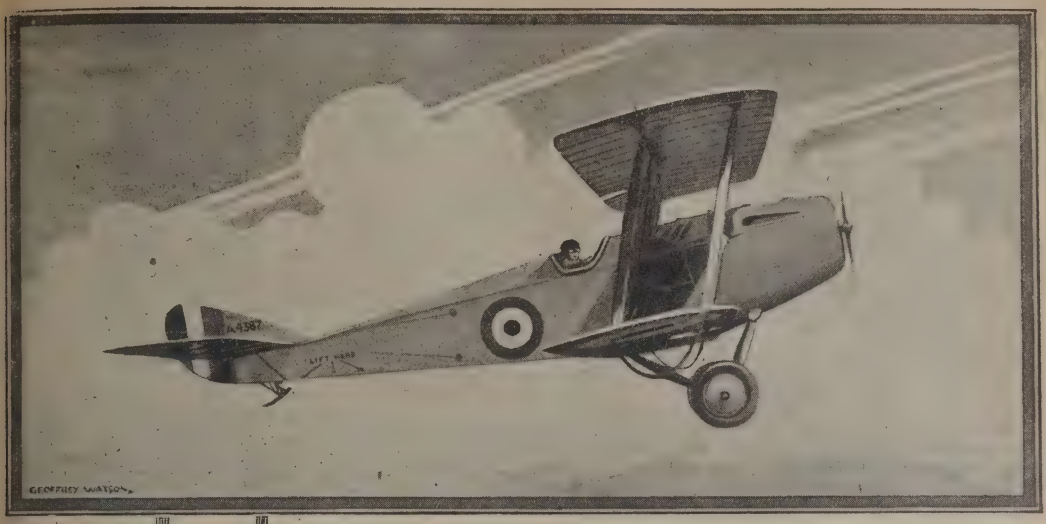
Injured.—Hobbs, Flt. Lt. B. D., D.S.O., D.S.C., R.N.

Slightly Injured.—Wimbush, Prob. Flt. Officer E. A. B., R.N.

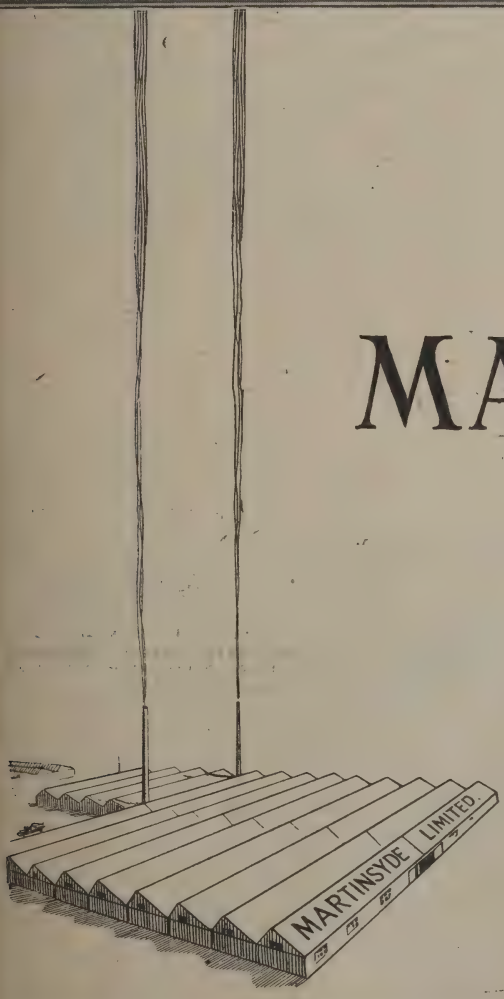
Reported August 27th.

Killed.—Woodall, Flt. Sub-Lt. A. S., R.N.

PERSONAL NOTICES.



Deaths.



ARNOLD.—Flt. Lt. Charles Vernon Arnold, R.N., accidentally killed on August 16th, was born in 1894, and educated at Dulwich College and the South Kensington College of Engineering (City and Guilds), where he took his diploma and the B.Sc. degree (London), with first-class honours. At school he distinguished himself as a cricketer, and made in a first-class match the record of 173, and with his partner the record for the first wicket of 341.

On the outbreak of the war he volunteered as a private in the H.A.C., and transferred six months later to the R.N.A.S. He was on board the "Empress" when it was successful in saving over 400 lives from the torpedoed steamer "Hesperian." He afterwards served on the Eastern Mediterranean Station, and last spring was made commanding officer of an important aerodrome abroad. Later, he was appointed instructor at an aerodrome in the home counties. The accident which caused his death and that of his pupil, Probationary Flight Officer Forman, was due to engine trouble at a low altitude, resulting in side-slip. He was recognised as an able officer, zealous in work, firm and strong in discipline. Last spring both the British and French admirals signalled him from their ships, "Well done; your work was excellent! Our congratulations." He was the only son of Captain Ernest C. Arnold, R.A.M.C. (late of Forest Hill), and Mrs. Arnold (née Wedel), of Christiania.

One of those who served in the Eastern Mediterranean with him writes: "He was a wonderful observer's pilot for he always acted in the interests of the observer, and when banking he even put on just the right bank so as not to interfere with the wireless. If there were any dirty work to do he always got it and did it well.

"He was really a splendid fellow, and his work in the Eastern Mediterranean was wonderful, and it deserved the D.S.O. time and time again. On one occasion he undertook a rather deadly bombing raid in Asia Minor and on returning, although at rather a good height, some enterprising Turks opened fire on exactly

the same level with him, from a gun emplacement in the hills. He had a narrow escape, but returned to the ship with his floats riddled. Lord Torrington, R.N.V.R., now a prisoner, did some splendid work with Arnold.

"On leaving the ship from which he was then operating, he was put in command of an aerodrome, where he had the job of teaching Greeks to fly. He returned to England after about 18 months of strenuous active service. Aerial photography was Arnold's strong point, and whether flying Shorts or Schneiders he was a good all-round steady pilot, and he is a great loss to the Service."

BIBBY.—Flt. Sub-Lt. J. R. Bibby, R.N., who was killed in the Eastern Mediterranean on June 11th, was born in England and educated in Canada, where he was in charge of a power station at Niagara Falls. He took his pilot's certificate at the Wright Flying School, Florida. Upon appointment to the Royal Naval Air Service he completed his training at Windermere.

COOK.—Flt. Sub-Lt. Cecil Barnaby Cook, R.N., who was accidentally killed on August 20th, aged 18, was the younger son of Mr. and Mrs. Herbert Cook, of Bromley, Kent. He was educated at Dulwich College and obtained his commission in March and his certificate in July. He was an enthusiastic flier and his commanding officer stated that he was a most capable and promising pilot.

LEWIS.—Flt. Sub-Lt. Frank C. Lewis, R.N., who was killed in aerial combat on August 21st, was the only son of the late Frank B. Lewis, of Moscow Court, W., and of Mrs. Lewis, 18, Craven Hill Gardens, W. He was 19 years of age.

WYATT.—Flt. Lt. Charles J. Wyatt, R.N., who was killed on August 21st, was the second son of Mr. and Mrs. W. T. Wyatt, 87, Fordwych Road, Cricklewood, N.W.

Engagement.

JONES—ROBERTS.—The wedding arranged between Sqdn. Comdr. R. Hilton Jones, R.N., and Eileen, only daughter of Col. and Mrs. Astley Roberts, will take place at St. Saviour's Church, Eastbourne, on Wednesday, September 5th, at 2.30 p.m. No invitations are being issued, but all friends will be welcome at the church.

Marriage.

KEANE—MONTGOMERIE.—On August 21st, at Christ Church, Mayfair, Flt. Sub-Lt. E. J. Keane, R.N., was married to Evelyn Mary, eldest daughter of James C. Montgomerie, of 9, Walpole Gardens, Strawberry Hill, Middlesex, by the Rev. E. S. Hilliard.

Birth.

COURTNEY.—On August 24th, at a nursing home, Teignmouth, the wife of Wing Commander I. T. Courtney, R.N.A.S. (temp. Lieut.-Col. R.M.L.I.), of a son, who survived his birth only a few hours.

Vice-Admiral Bacon, presenting Distinguished Service Medals and Military Medals to over 50 members of the Dover Patrol, including the R.N.A.S., at Dover, congratulated the recipients, and said he looked to them to redouble their efforts to bring the war to a satisfactory conclusion. Some people said they were tired of the war. "We," he continued, "have not got to be tired of the war—we have got to help to fight the war, not to talk about it, especially at this time, when the Germans are having a bad time of it. Yes, a very bad time of it: and, what is more, they are going to have a worse one. For the last two years they have been afraid to tackle our Navy. During the next two months they will have again and again to meet our troops, and again and again they will be forced back, and they know it. Then, behind all, they have a hopeless winter of half starvation to look forward to. Now is the time to throw ourselves into any work that good fortune may bring our way. This particular patrol has its teeth well into their flanks, and forms a good stopper to the mouth of the Channel."

MILITARY.

G.H.Q. Communiqués.

August 21st, 9.2. p.m.—Great activity in the air continued yesterday on both sides. Our aeroplanes successfully carried out their usual work, although enemy aircraft were aggressive.

In air fighting nine German machines were brought down and seven driven down out of control.

Four of our aeroplanes are missing.

August 22nd, 9.12 p.m.—Yesterday there was again great activity in the air on both sides, and fierce fighting took place. Twelve German aeroplanes were brought down by our machines and five others were driven down out of control.

Twelve of our aeroplanes are missing, including two which collided behind the enemy's lines during a bombing raid.

August 23rd, 9.10 p.m.—During the past week fighting in the air has been incessant and more severe than in any other similar period since the beginning of the war. Yesterday the activity of the enemy's aircraft was less marked, and his pilots appeared disinclined to engage when close to the lines. None the less a great number of fights again took place, in which our machines were favoured by the change of wind.

As the result of the fighting 12 German aeroplanes were brought down and six others were driven down out of control.

Two of our machines are missing, one of which was seen to effect a landing on the beach at Ostend.

Throughout yesterday's attacks our aeroplanes successfully co-operated with our artillery and infantry, and the usual bombing

AERONAUTICAL ENGINEERING

SUPPLEMENT TO "THE AEROPLANE"

INCORPORATING AIRCRAFT ENGINEERING, AERODYNAMICS, AND MATTERS PERTAINING TO THE AERONAUTICAL ENGINEER AND THE AIRCRAFT TRADER

A Well-Equipped Flying School.

A Renault-Caudron converted for an Anzani engine. Mr. Etches and Mr. Brynildsen (the school pilot) are seen with the machine.

A recent visit to Bournemouth made it possible to inspect the new aerodrome purchased by the Bournemouth Aviation Co., Ltd., about a mile from the old temporary aerodrome at Talbot Village.

The new aerodrome is a fine tract of ground of about 100 acres in extent, surrounded on three sides by land which affords good landing ground in case of accident.

The feature of chief interest, however, is the large hangar in which the school outfit is accommodated.

One expects, in the well-equipped modern flying school, to see a decent array of machines, all tuned up and ready for work, but the additional spectacle of rows of fuselage and wing units, stacks of struts, tail planes and wheels is something rather new. Herein lies the explanation :—

From its inception, eighteen months ago, the proprietors of the Bournemouth School have always employed Caudron-type machines, some of which they constructed themselves. The selection has been justified because, from the start, the work of the school has been marred by no accident, something like a hundred pupils have received instruction, and during the school's existence only three forced landings have been made outside the aerodrome.

The first machine to be installed is still in daily use, although it has done over a thousand hours in the air, the repairs that have been done being of quite a minor character. Such an excellent record encouraged the firm to purchase from the Air Board 37 Caudron biplanes, most of them unused, which had been built to carry Renault engines.

A Caudron-type School Machine, built at Bournemouth and re designed internally.

A clever and effective nose-piece has been designed to take the 80-h.p. Anzani engine, of which the firm possesses a sufficient number, and, as has been mentioned before, this stock of machines is stacked around as a reserve, from which to draw in case of accident to any of the seven other Caudron type machines.

Mr. F. E. Etches, managing director of the school, has superintended the construction of the new premises, which are being equipped for the construction of complete machines, plant for wood and metal work, and acetylene welding being available.

Instruction is superintended by Mr. Brynildsen, a pilot of considerable ability, and he is very largely responsible for the record of success and safety which the school has enjoyed.

Mr. Etches has a special offer to make to candidates for the Flying Services and to those who have but a small amount of time in which to learn to fly. Full particulars of this scheme will be forwarded to inquirers mentioning THE AEROPLANE, and applications should be addressed to the Bournemouth Aviation Co., Ltd., Talbot Village, Bournemouth.—W. L. W.

The Italian Aircraft Industry and the War.

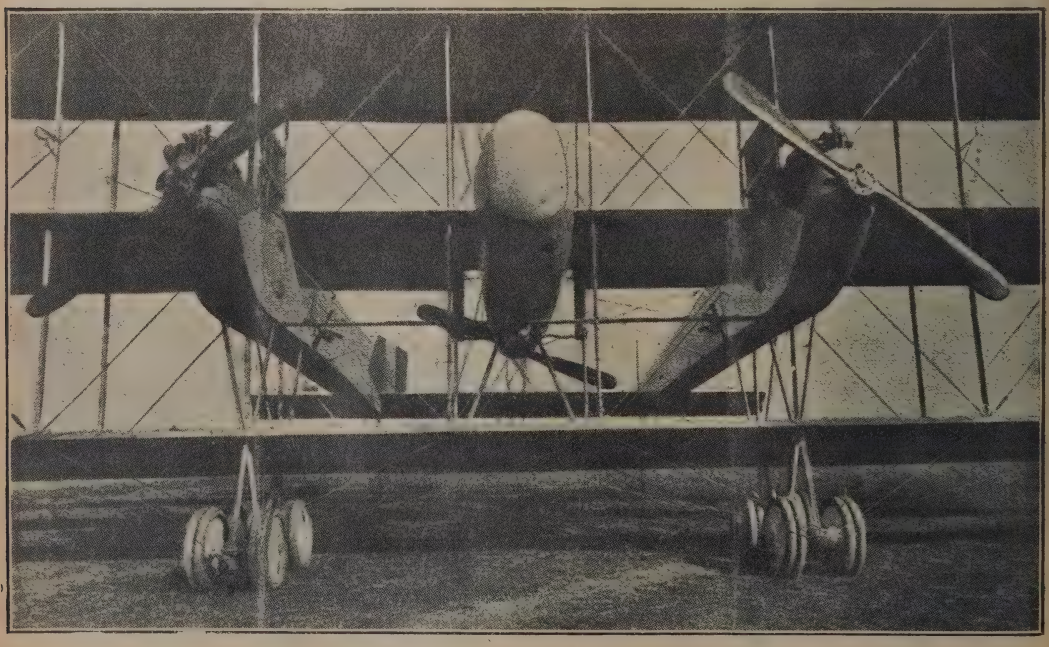
The following article is reprinted with acknowledgments from the "Aerial Age Weekly," New York, dated July 30th:—

[THE AEROPLANE takes no responsibility for the accuracy or otherwise of any statements following.]

Italy's experiences in military aeronautics, which she entered, practically a newcomer, in 1915, and which have enabled her now to produce the most powerful aeroplane in the world, a craft driven by motors totalling 900 horse-power, and capable of sustaining three tons besides the craft's own displacement and the weight of its operator and fuel, are an indication of the possibilities which the recently energised activities of this country may accomplish. For, according to Major R. Perfetti, of the Italian Royal Flying Corps, nearly all of Italy's aircraft, at the front and now under construction, have been manufactured of raw materials supplied by this country, the same type and quality of materials which are now at the disposal of the United States Aircraft Production Board, and the industry that has developed these materials into finished products of the highest type is itself the development of manufacture that in February, 1915, employed only 100 men. Now 40,000 are engaged in aeroplane manufacture in Italy.

In an address, delivered last week at the Automobile Club under the auspices of the Aero Club, Major Perfetti extended the thanks of Italy to the United States for the assistance of this country in advancement of Italian aeronautics, and, after an explanation of the efforts of Italian aeronauts to develop motors of especially high power, made a plea that the United States devote itself to the creation of very large engines.

"Italy has made tremendous progress in the technique of aeroplane construction," said Major Perfetti. "She has created a range of types which represent the fastest aeroplane in the world, with a speed of 139 miles an hour, and the fastest seaplane, with a speed of 112 miles an hour, and the largest aeroplane, the Caproni triplane, with a 900 horse-power motor and capable of carrying three tons. But we and the United States must make still more progress.



"Since the beginning of the war in 1914 we have seen the land armies attain a sort of balance which would be difficult to upset without great sacrifice of life. But it must be upset or some other solution must be found, for the extensive success of the submarine is threatening the supply of materials essential, not only to sustain life, but to conduct the war. We must find a method which will drive the enemy back, not a mile or two, but for tens and hundreds of miles. To accomplish this the important supply bases of the enemy must be destroyed or rendered temporarily useless, and the aeroplane seems to offer the only immediate solution.

"Until now the chief factor in military operations has been the gun designed to discharge large quantities of high explosives. The aeroplane has been used chiefly for scouting. Now the aeroplane must be used as an instrument for carrying and discharging explosives beyond the range of land batteries and the supply of explosives each plane carries must be large.

"The possibility of accomplishing this is apparent when one studies the history of the aeroplane in war. The first planes were equipped with motors of 100 horse-power and under, and they had a comparatively short cruising radius because of inability to carry both fuel and explosives; one or the other had to be sacrificed.

"To-day we have reached a point where the 1,000 horse-power motor may be turned out capable of carrying three tons and more of useful weight and with a cruising radius of 300 to 350 miles, and it is along these lines that Italy has been conducting experiments. The big Caproni triplanes are already in use by our Government for transportation of men and supplies between military centres, and their carrying range, both in weight and distance, will be increased as development proceeds.

"Besides this, Italy has manufactured a large number of the famous semi-rigid Forlanini dirigibles, which are more efficient than the Zeppelins, half the weight of the Zeppelin, the aluminium frame having been eliminated in the Italian construction. For two years the Forlanini has convoyed ships nightly from Italian ports, keeping a watch for U-boats, and not a ship so convoyed has been sunk."

We have on hand a considerable quantity of "Nonflamoid," in strips, 48in. × 7in., and can consequently give immediate delivery of Windscreens or Panels of dimensions not exceeding the above.

The LONDON LABEL CO., Ltd.

Contractors to H.M. Government,

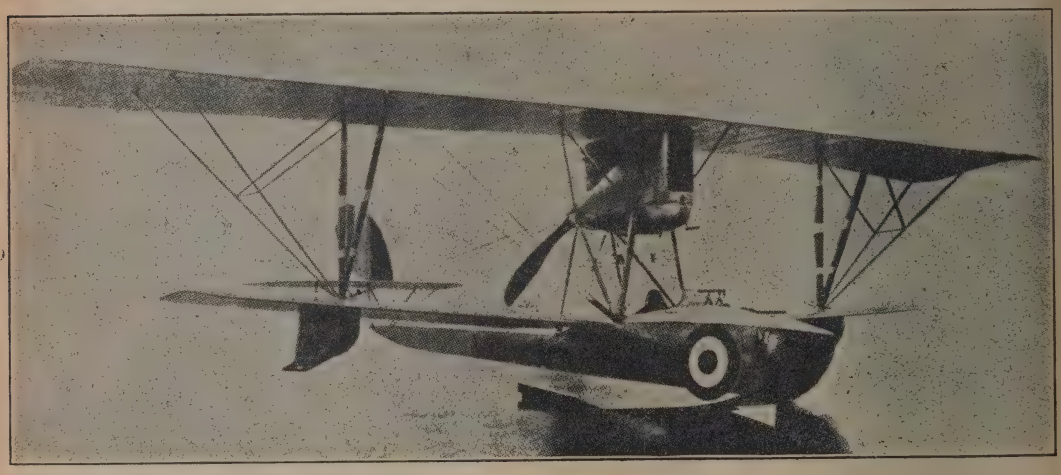
HARLEY WORKS, BECKTON ROAD, LONDON, E.16.

Phone—East 1300. Telegrams—Lonlabel, Canning, London.

But, successful as this nation has been, Major Perfetti asserted that the combined aerial resources of the Allies were inadequate to the programme which he proposed, and he urged the United States, as the most valuable immediate step it could take, to begin the construction of vast numbers of aeroplanes and the development especially of great motors.

With A. Pomilio, an electrical engineer, Major Perfetti has been in this country for two years studying American aeronautics for his Government and contracting for the supply of aeroplane spruce, motor parts and so forth, which have made the Italian construction possible.

Some of the machines which Major Perfetti spoke of were astonishingly large. The 1,800 horse-power Caproni, carrying a load of five tons of explosives and fuel for twelve hours, has a speed of 80 miles per hour. The 600 horse-power Caproni triplane has two fuselages, with three Fiat or Isotta-Fraschini motors. Each of the engines is independent of the others, so that if two engines should stop, the machine could still keep in the air with the power of one engine. The machine carries a useful load of 4,400 lbs., which permits carrying fuel for six hours, a crew of three people, three guns, and 2,750 lbs. of bombs. It has a speed of close to 80 miles an hour, and is capable of climbing 3,250 ft. in 13 minutes, 6,500 ft. in 27 minutes and 10,000 ft. in 57 minutes.



The 600 horse-power bombing-type Caproni biplane, illustrated herewith, has the remarkable speed of 92 miles per hour. It is equipped with three Fiat motors of 200 horse-power. It can climb 3,250 ft. in six minutes and 30 seconds, 6,500 ft. in 14 minutes and 10,000 ft. in 35 minutes.

The Pomilio High Speed Two-Seater.

The 200 horse-power S. I. A. armed reconnaissance biplane is a two-seated machine with a speed of 118 miles per hour and a climbing speed of 3,250 ft. in 3 minutes.

Besides the above Italy has developed several other efficient types of seaplanes and fighting aeroplanes, including the Macchi seaplane, with a speed of over 110 miles an hour; the Pomilio gun-carrying biplane, with a speed of 108 miles an hour, and the S. V. single-seater fighting tractor, which is reported to give a speed of close to 140 miles an hour and a climbing ability of 10,000 ft. in 8 minutes.

The Nieuport-Macchi Flying Boat.

PRACTICAL PYROMETERS.

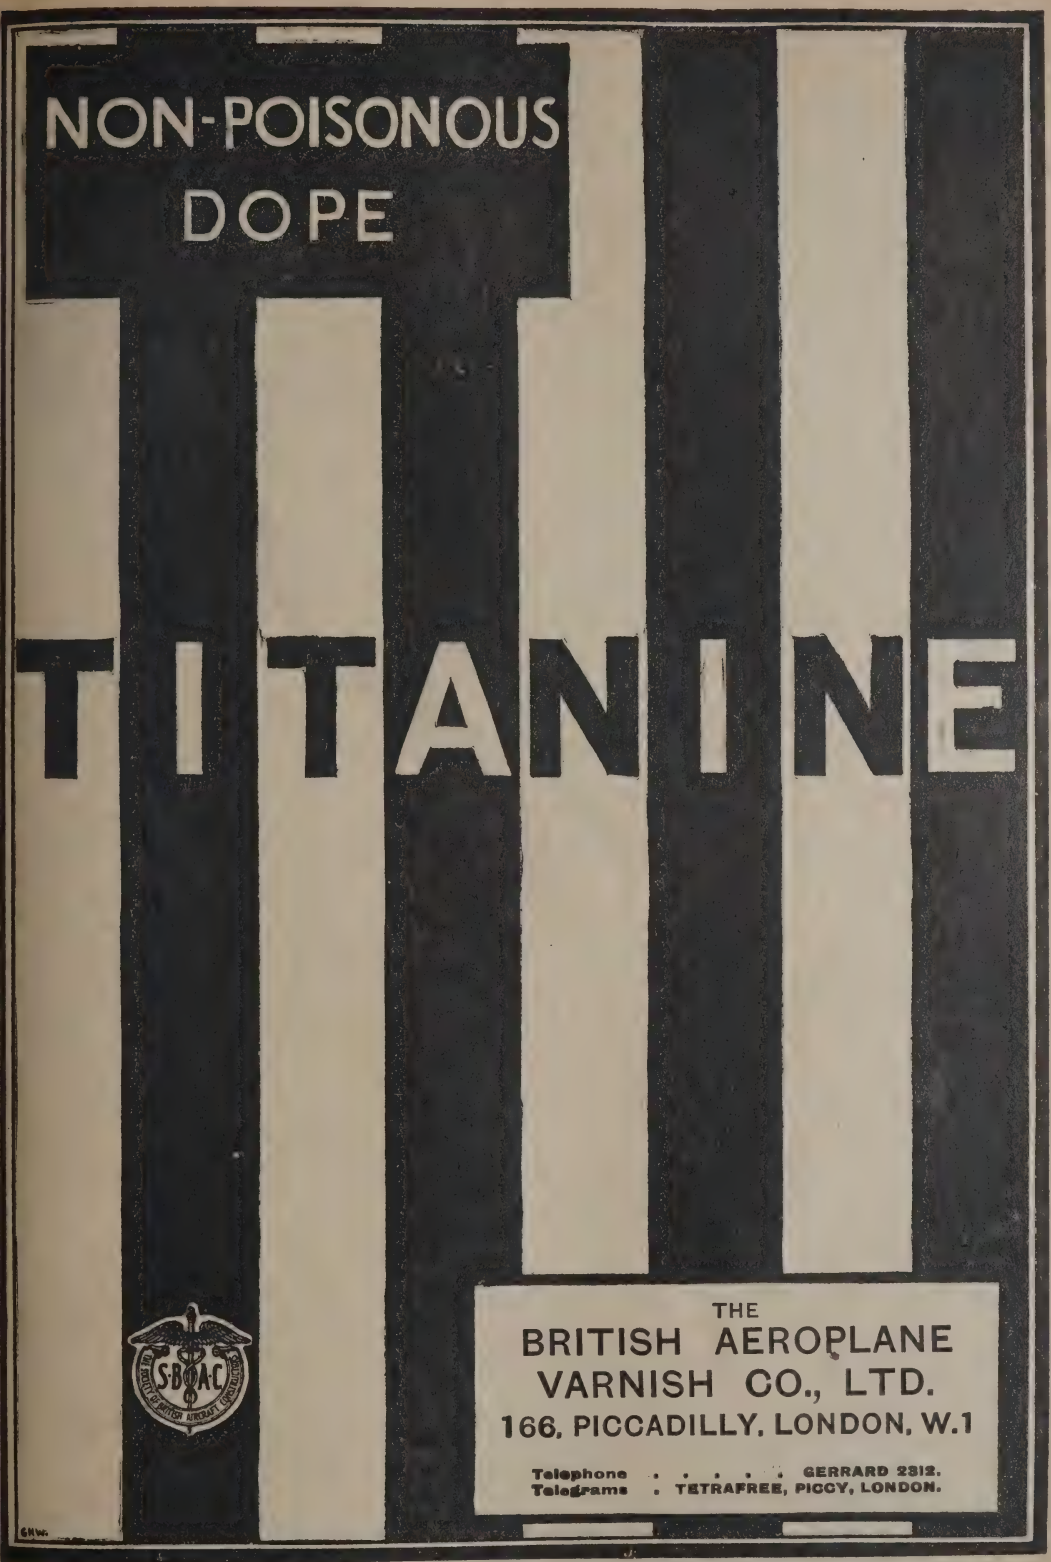
The Foster Instrument Company, of Letchworth, Herts, has issued a new catalogue of pyrometers, No. 19.

The catalogue draws attention to the use of Hoskins' patent construction and alloys in the Forster thermo-couples, which possess high electro-motive force and great robustness. These qualities are also found in the indicating and recording instruments used with the thermo-couples.

Pyrometers are listed for all purposes, for low and high ranges of temperature.

The Foster Company has made arrangements to maintain pyrometer sets by contract upon terms which are advantageous to users.

The catalogue contains diagrams showing the methods of installing the different pyrometers in furnaces and other heating chambers. Those interested are invited to apply for copies of this interesting catalogue.



NEW PREMISES

Thompson Bros. (Bilston), Ltd., of the Bradley Engineering Works, Bilston, have taken possession of large new buildings opposite their present works in order to find more adequate room for the manufacture of metal components for aircraft, on which they have been engaged for the last two years.

The new shop is 130 ft. long, 50 ft. wide, in one span, being well lighted and ventilated. It is equipped with electric drives for the machines, comprising modern lathes, capstans, millers, saws, grinders, drills, power presses, etc. It is also provided with a large oxy-acetylene welding plant, and there is also a small woodworking and doping section.

It is not possible to give details of the work carried out, but it consists chiefly of under-carriages, tubular framework, engine plates, levers, etc., and the welding of aluminium and steel, etc.

Extensions in the shape of stove enamelling and dope shops are also being laid down. All inquiries will receive prompt attention.

KINDLY MENTION "THE AEROPLANE" WHEN CORRESPONDING WITH ADVERTISERS.

The Production of Aeroplanes and their Components

(Eleventh Instalment.)

BY STEPNEY BLAKENEY.

Making Eyebolts.

Eyebolts are made in precisely the same way, only that round steel bar is used instead of hexagon, and the parting-off tool is shaped so as to produce a semi-circular elongated end. The bolt is then put into a milling jig or clamp and the head milled between two milling-cutters. This can be done with batches of, say, about eight at a time, after which each batch is put into a drilling jig and drilled.

Should the eyebolt require to have the eye at a certain angle, then of course the jig which holds the eyebolt during the milling process is made to hold the bolt at the required angle, and thus accuracy is obtained. The accuracy of this angle is most essential, otherwise a fair pull is not obtained by any tie rod or streamline wire which may be attached to it, and inaccuracy may start a dangerous fracture.

To the inexperienced erector this item may not appear to be of much importance, but it happens to be one of those matters which strictly demand the attention of all erectors. It applies to wiring plates as well, which must be bent to suit the angle precisely, between the two points of attachment of any tie rod or streamline wire.

Snugs.

Reverting again to eyebolts, many of these are made with a "snug" under the head. This, to those who are not familiar with this term, consists of a projection to prevent the bolt from turning round when in its correct position. This operation in the manufacture of eyebolts is usually done by using a dividing head attached to a milling machine table. This holds the bolt in position whilst the milling cutter produces the required shape, which in many cases may be described as a semi-elliptical projection, about 3/16-in. deep.

Lift Plates.

Lift plates, i.e. those which take the main load or flying wires of the machine, frequently consist of laminated plates soldered together. These have to be made with considerable care, as much experience is necessary in knowing the additional amount of length required to allow for bending, so as to enable the various holes to be drilled accurately in position.

To enable this to be done, it is necessary to pin the laminations together and put the fitting in a jig to be drilled, after which it is best to use a cast iron or mild steel block, designed to be used as a bending jig. It will be almost impossible to describe these, as of course they are very numerous owing to the number and various types of fittings to be bent. Accordingly it is best to get the tool-maker to design one specially to suit the particular fittings required to be bent.

The value of a small fly press is considerable for many small parts, and, with simply designed jigs, an intelligent youth can produce a considerable number per day of small washers, etc.

Chassis Strut Fittings.

The chassis strut fittings will now be required, and these will require careful thought, as they are made to grip the lower front spar, and at the same time pass round the compression strut. The first thing to do in making fittings of this description is carefully to set out the whole fitting on some light gauge block-iron and steel, and bend up the fitting and tack it in shape by welding it together.

After this the portion for holding the chassis struts can be set out on the flat plate and bent up to the required streamline shape. Then the angle required by the strut can be checked.

This having been done, the fitting and manufacture of this part must be commenced. For this purpose, and to assist the sheet-metal worker or fitter employed, it would be as well to have a dummy portion of the front spar fitted onto a dummy compression spar, so as to enable the metal-worker to grasp what to do.

Also a couple of rejected struts (which, of course, should not exist) may be cut to dead size in the wood-finishing department, and handed over to the metal department, so that they can be actually placed into the position and fittings made for them, and thus it will enable the worker accurately to discover the dimensions to which he has to work. It will also ensure the streamline portion of the fitting which holds the strut being accurately fitted to the portion clipping the front spar and the compression strut.

This accurate fitting is most necessary, otherwise the joint between the two fittings will be a very bad one, and this might lead to disaster at any moment if the machine landed on rough ground. This might occur for any of the following reasons: either the acetylene-welded joint between the two component parts forming the fitting might be weak, and badly fitted to enable the right-angle of splay to be obtained, in which case there would be gaps to be filled up with the welding; or else the strut may never have been normally and naturally at the right angle, and may have been strained or forced into. This procedure would either badly strain the fitting or the strut, and possibly both, and the ultimate result would be a bad failure, possibly at some critical moment.

Therefore it can easily be seen that the fitting and making of such fittings as I have briefly described requires patience and care, and the first one or two will in all probability take double the time to make that the last ones take. But that cannot be helped; accuracy and perfect workmanship must be had.

The above remarks equally apply to the fitting to be made for attaching and holding together the two struts in the Vee shape in accordance with the design, and also for holding the steel tube forming the axle and the shock-absorber fittings.

The steel tube which forms the axle is usually of air-hardened steel, and the drilling of the holes in it, for attaching the "rubbing plates," or distance washers, against which the chassis wheels rub, and by which they are kept in position, entails considerable trouble owing to the hardness of the steel. I have found by experience that frequently a shop-made flat diamond-pointed drill is superior to any twist drill for drilling the holes for the taper pin. Turpentine forms the best cutting compound, or lubricant.

The wheel is kept on the axle by means of a large washer, about 3/16-in. thick by about 1½-in. long, which is an easy push-fit over the axle, secured into its place by another taper pin.

These washers are, of course, turned out of solid bar or turret lathes, and are of the usual class of bar work for which turret lathes and capstan lathes are made. The washers are usually made by girls doing repetition work in the machine-shop.

Strut Sockets.

The strut sockets for the centre plane will be the next fittings to consider. These will take the form of sheet steel streamlined sockets on wiring plates, attached to the top longerons into which the struts will be bedded. The bracing wires will be attached to the lugs for bracing the centre plane.

These sockets will probably be made of 18 gauge sheet steel, welded to the wiring plate, which will be made of about 12 gauge steel. As these fittings occupy a position of considerable importance, like other parts they must be made accurately to the dimensions given. Care must be taken that the process of welding in no way impairs the strength of the fitting.

Considerable care must be taken to see that the wiring lugs are fully up to size, and also that all radii on the wiring lugs are fully up to dimensions. It is important also that the pin-hole in the lugs is correctly in position and that the hole after drilling is accurately finished to dead size with a reamer. These points must be carefully looked to, or you may be sure that they will be detected by the A.I.D. inspector.

The result will be that he will lose his confidence in you, and he will consequently be liable to treat every fitting put up to him for his inspection with considerable suspicion. This is the most undesirable thing that could possibly happen. If possible, try and convince the A.I.D. by actual practice that he cannot teach you anything, but don't imagine it; that is fatal; see to it yourself, and don't pass the job on to somebody else to do. He may think that if you are too tired to do it, that it is of not much importance, and then the trouble commences.

If everybody did their job, I think that most firms would find that there would be considerably less work for everybody to do. Shorter hours would be possible, and greater output would follow.

Spar Brackets.

The spar brackets for attaching the lower wings to the fuselage consist, for our purpose, of mild steel stampings. These, of course, must be machined all over, and the lugs, where the hinge pins pass through, carefully machined to a specified angle with the rest of the bracket so as to give the wings the required angle of incidence.

The best way to machine these is to clamp them to a machining jig onto the bed of the table of a milling machine, about four at a time, and pass a couple of side to face milling cutters past the jaws of the stamping, and then mill out the centre portion with a single cutter. When this work is complete, they can be transferred to another jig and milling machine and have the outside surfaces of the jaws milled.

This being done, the next thing to do is to mill the lug to the required angle, between milling cutters, and then fix the bracket for drilling the hinge pin-hole; the lightenings can then be drilled out and finished with a round file. The only remaining work to be done is the drilling.

AMERICAN TIMBER SUPPLIES.

From "Aerial Age," New York, August 6th :—

As a result of a conference held for the past three days between authorised representatives of spruce manufacturers of Oregon and Washington and representatives of the Signal Corps, the Aircraft Production Board, the British, French, and Italian missions now in Washington, and the lumber committee of the National Council of Defence, Howard E. Jayne and F. A. Douty, of Oregon, proposed on behalf of the spruce men to furnish aircraft spruce for the coming year's big programme at 105 dols. per 1,000 ft. This price is about one-half that which has been paid up to now by many of the aeroplane manufacturers. The price applies to the Allies' needs as well as to those of the United States.

If it is finally approved by Government authorities it will, in the opinion of the lumber committee, unquestionably result in a big saving on spruce requirements.

The specifications which have been proposed by the spruce men and which received the informal approval of the Government's representatives present are as follows :—

Thickness.—2 ins. to 6 ins., inclusive. At least 60 per cent. to be 3 ins. and 4 ins. thick. Not more than 40 per cent. 2 ins., 5 ins., and 6 ins. thick.

Width.—All to be 4 ins. and wider; not over 10 per cent. under 5 ins. wide.

Length.—Fifty per cent. to be 19 ft. and longer. Fifty per cent. to be 4 ft. and longer.

Measurement.—Width and thickness fractional. Lengths in multiples of 1 ft.

Grain.—All lumber 3 ins. and thicker shall be not less than 70 per cent. vertical grain of an angle of 45 degs. to 90 degs. on each carload. All lumber 2 ins. thick shall be not less than 30 per cent. vertical grain of an angle of 45 degs. to 90 degs. on each carload.

Grades.—The grades agreed to are as follows :

The 50 per cent. of all lumber 18 ft. and longer shall be clear four sides, straight grained, not less than six annular growth rings for each 1 in., sound and well manufactured, free from shakes, spiral and curly grain.

This grade will admit of bright sap, wane, pinworm holes, slight variations in sawing, or other defects that will not impair its use for wing beams.

The 50 per cent. of all lumber 4 ft. and longer shall yield clear cuttings, straight grained, not less than six annular growth rings per each 1 in., sound and well manufactured, free from shake, spiral and curly grain; some may contain knots, pitch pockets, wane, pinworm holes, slight variations in sawing, and other defects that will not impair its use for the purpose intended, providing, however, that each piece must produce, for buyer, clear straight grain, cuttings from 4-ft. to 17-ft. lengths, which shall not include over 5 per cent. of such cuttings, 4 ft. to 7 ft. inclusive.

AMERICAN TRADE NOTES.

The Curtiss Aeroplane and Motor Co., of Buffalo, is erecting plant at Atlantic City, N.J., which is expected to be in running order in about a month's time. The construction of aeroplanes will be undertaken. In addition a school for candidates for admission to the U.S. Flying Corps will be organised.

* * *

The Curtiss Aeroplane and Motor Corporation have issued the first edition of a monthly magazine dealing principally with Curtiss affairs and with aviation in general.

The "Curtiss Flyleaf," as this production is called, records the appointment of Mr. Glenn H. Curtiss to the Presidency of the Aircraft Manufacturers Association, and also bears witness to the work of Mr. Curtiss in the past and to the achievements of the Curtiss aeroplane.

The "Flyleaf" is well illustrated with half-tone and line blocks, and taking it all round is a very successful effort.

MACHINE TOOLS.

A souvenir catalogue, in the composition of which considerable brain-work has been expended with excellent results, has come to hand from The Judson-Jackson Co., Ltd., which gives much interesting information about this well-known firm. The illustrations show many interesting machine tools, including Capstan lathes, screw-cutting lathes, and appliances of a kindred nature. An interesting feature of the catalogue is a short paragraph facing each illustration, giving sound advice upon very varying aspects of manufacturing business with relation to such subjects as the comfort of workers, foreign and colonial policy, questions of output and of equipment generally.

Messrs. Judson and Jackson are evidently very much alive to the importance of detail, which contributes so largely to successful manufacture. This firm also produces boring, slotting and drilling machines of all descriptions, power hammers and small articles such as hacksaw blades and drills. Machine-shop superintendents would therefore do well to bear the name of the firm in mind, and to send any inquiries to 50, Marsham Street, London, S.W.1.

A NEW DEPARTURE.

The firm of John Meerloo and Sons, of Cleveland Street, Mil End, who are already well known in the Aircraft Industry fo the manufacture, inspection, and other steel stamps and stencils have formed a new company, called the Meerloo Engineerin Co., Ltd., for the purpose of manufacturing all kinds of aircra parts, especially small repetition parts and pressings.

A modern factory has been acquired opposite Maryland Poin Station, G.E.R., Stratford, and has been thoroughly equippe with up-to-date machine tools.

The firm is already producing A.G.S. parts in large quantities and holds important contracts for their manufacture.

It is the intention of the proprietors to develop the busines and to increase output by the addition of further plant, and day and night shift will be worked.

Mr. Jack Meerloo is the managing director of the new concer and his great experience of metal work, which extends over period of thirty years, should be invaluable in the efficient pr duction of aircraft parts.

The firm are open to consider further contracts, and invit inquiries.

POWER PLANT.

In the nature of things, the organiser of a new works ha frequently to establish himself miles and miles from civilisatio and in many instances is forced to make his works self-suppor ing to as great a degree as a colonist. He is obliged not onl to provide his own quarters and draining systems, but also ligh ing and power.

When this emergency arises it should be borne in mind tha Messrs. Ruston and Proctor, of Lincoln, produce many tpyes heavy oil engines which are suitable for supplying power direc or for generating electricity for motors and lighting purpose A well-equipped aircraft works in the South of England employ an oil engine made by this firm with considerable success, an by the aid of dynamos and storage batteries is independent of a outside aid in its supply of power and light.

LE MOT JUSTE.

From the "Daily Express."

The development of the war in the air is responsible for man romances. Not the least interesting among them is the sto of Mr. John A. Whitehead, the founder of Whitehead Aircraf Ltd. He is an Englishman who, when little more than a bo ran away from home to make a fortune in the States. The fo tune did not materialise, but he gained what was more valuabl much worldly and practical experience. He returned home year or so before the war, filled with the American spirit enterprise.

He had little money, but, as an American friend puts it, h had "inexhaustible credit in the Amalgamated Bank of Imagina tion and Nerve." This stood him in good stead, and he wa among the first to see that aircraft would be a dominating featu in the war.

To-day he controls an aircraft company with a large capita has 2,000 employees, an aerodrome of 300 acres at Hanwort Park "up the river," and lives with his mother in Buccleuc House, once the Duke of Buccleuch's magnificent home, ju above Richmond Bridge.

WANTED—A CANE.

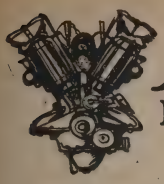
"Lost, 5.35 train, Eastbourne-Clapham Junction, Sunday afte noon, August 19th, Malacca Cane with golden aeroplane worke round upper portion, aviator's cap on end of curved handl Considerable sentimental interest attaches to the stick, presente by certain famous airman to owner, with name inscribe Reward from J. A. Whitehead, Whitehead Aircraft, Richmond.

THE SOPWITH SPORTS MEETING.

The Sopwith Aviation Company's annual sports and fête wi take place on Saturday, September 15th, at the Old Kingstonian Football Ground, Kingston, commencing at 2 p.m.

The competitions, which will include five events, open to a munition workers, will be governed by the A.A.A. Laws; and a the proceeds will be devoted to the Flying Services' Fund, it hoped that a very large entry will be received.

The open events are as follows: 100 yards handicap, 440 yar handicap, one mile handicap, one mile relay race, and tug-of-wa (teams of eight). Entrance fees: handicap events, 1s. each relay, 3s. per team; tug-of-war, 8s. per team.



There is also a special invitation race, open to members of th R.N.A.S. and R.F.C. only, 100 yards handicap.

There will also be works championships, novelty races, an other competitions.

The sports will be followed by a grand dance at 7 p.m., and concert by the Sopwith Choral Society. The Sopwith Orchestr will provide music.

Entries close first post on Tuesday, September 4th, and fu particulars may be obtained from the hon. sports secretary an director, Mr. V. W. Derrington, the Sopwith Aviation Co., Ltd Kingston-on-Thames.

Munition workers of all sorts are cordially invited, both a spectators and as competitors. Admission to the grounds wi be 6d. and 1s. Refreshments at popular prices.

AERO-MOTORS
IN KIND AND CONSTRUCTION

By Geoffrey de Holden-Stone

[Though large stationary oil engines are not precisely aero-motors, the following article by Mr. de Holden-Stone is included in this series on account of its relationship to other articles on two-stroke motors.—Ed.]

Some Points of the Petter Oil Engine.

"Not cheapness in its common sense, but cheapness born of excellence," reminiscent though it is of the apt phrasing of the late Dr. Samuel Watts—which was as cheap as it was excellent—is really a very fair epitome of at least one ideal of the two-stroke cycle. That is in a good example. The trouble is that so many designers forget that ideal, and introduce all sorts of mechanical complications, apparently for the sake of getting a working stroke out of every cylinder once in every shaft revolution, by some means different from any other, which, come to think of it, is like walking on your hands in full kit.

The thing can be done, of course; and one remembers, has to be done very rapidly to keep going at all. But acceleration and general walking efficiency are likely to be much inferior to the ordinary, heel-and-toe, four-stroke way, whereas really sound two-stroke design means stripping to the skin, shorts and shoes of motor-mechanism to get the very maximum of unencumbered movement.

Those that Do.

Messrs. Petter, of Yeovil, long ago recognised this. Also, that there are just two kinds of most humans and motors, those that do and those that don't. Of the then best-known type of two-stroker, the one that took carburant into its crank-chamber and the one that did not, but merely air instead. And that of the two, the former was impossible as a paraffin proposition; while the latter lent itself to at least two variations—the Evans method, by which the air under primary compression siphons up a dose of fuel as it runs through the transfer passage, and that other—of which the great inventor remains unidentified—that has its dose injected on the top of the compression-stroke.

The Fons et Origo.

Wisely, Messrs. Petter adopted both some years ago, in the Somersetshire way. People will tell you that the two-stroke cycle itself was invented in Somersetshire. Now I will concede that Gunpowder Plot, six-apple cider, medlars, laver, and shredded ham were all invented in Somersetshire.

But the two-stroke cycle was no more invented there than shirts at Crewkerne, gloves at Stoke, or flirtation at Bath: nor, so far as I remember, any particularly new fashion of original sin. Lancashire is solely to blame, in the person of one William Robson of Tangye's.

Experientia Docet.

Nevertheless, on results—and the large list of more than satisfied customers their semi-Diesel type crude oil engines have served all over the world bears witness—I will agree that Messrs. Petter have combined in one design the merits of the high-compression Diesel type with those of the low-compression oil engine. Not that there is so much of the Diesel type about it, either. The chief merit to my mind is that it is really demi-semi-Diesel: all the few merits and none of the many complications of that Teutonic sham.

They have, further, got something which shows a better card on the whole than the much more expensive Körting or Ochelhauser, and a better consumption than either: and as a Day-type in the main, of course one with no valves, power-wasting valve-gear or other externals, and with the even torque that belongs to the cycle.

Simple Advantages.

Air, too, is still cheap in spite of the war and the Government; so it does not matter if the end-bearings shed a little: or if quite a lot pursues the exhaust out of the opposite port. In the crank-chamber, too, it may even help the lubricant to spread. It cannot mix with it and break it down as petrol does. And when the exhaust is done with, there is plenty left for a good m.e.p. ready to receive the vaporised pump-injected kerosene. Which, if merely atomised, would mix quite sufficiently with the compressed air to give a perfectly thorough combustion: this being distinctly an internal combustion rather than explosion motor.

Sound Design.

All that forced feed-lubrication—with ring-oiling for the main-bearings—and ample, substantially made oil and water circulating pumps can do to make the Petter engine a full-load heavy-duty job has been done.

Also, to get thrust and torque stresses as even on one bearing as on the other, in all the single-cylinder models a good-sized counter-wheel has been put on the front end to oppose the fly-wheel and belt-drum mass weight.

The Needs of Agriculture.

In fact, such a simple, easily-looked after, reliable design is this, that if Messrs. Petter will but issue a duplicate of their VD or VK sizes, and lay it as a horizontal, twin or opposed, the agriculture tractor-motor trade is theirs for the taking.

The Piston and Connecting-rod and Big-end of a Petter Two-Stroke Oil Engine.

The Cylinder and Ignition-cap of a Petter Two-Stroke Oil Engine.

They claim that the "verticality" of their design relieves the cylinder-walls from side thrust. Makers of vertical motors always do. But I suggest that if Messrs. Petter will take a second look at their own piston, and the long trunk of it, the high-set gudgeon-pin and hence the very easy angle of connecting-rod thrust, they will see that in these features, rather than in the erect position, lies the relief from side thrust they claim. Made on the same lines they could trust a horizontal type to be just as reliable, I am convinced.

But considering the special fuel-injection fashion of their cycle-variation, probably the best-studied and most appropriate feature of the design is the patent governor which simultaneously regulates the quantity of fuel-oil injection—and hence, too, the moment of injection—in proportion to the load. In this case the stroke of the rod-and-eccentric-operated, crescent-shaped rockers that depress the spring-load pump-spindles is not varied.

It could only be by varying their pivoting eccentrically, which might involve mechanical complication. Instead, the spindles themselves are held in freer or more restricted approach to the contact rollers of the rockers, so their stroke is greater or less.

At any rate, it manages to deal successfully with all the following oils:—Admiralty fuel oil, American refined petroleum, Anglo-Mexican fuel oil, Anglo-American fuel oil, Asiatic Petroleum Co.'s fuel oil, Assam crude petroleum, Borneo crude petroleum, Burmah crude petroleum, Disoil, gas oil (Great Britain), gasoleum, Grosny crude petroleum, Italian residue oil, Java crude petroleum, Mazout, Persian crude petroleum, Peruvian crude petroleum, Pennsylvanian crude petroleum, Resoleum, Rivadavia oil, Roumanian crude petroleum, Russian crude petroleum (naphtha), Russian refined petroleum, Shale oil (Scotland), Solar oil, Sumatra crude petroleum, Texas crude petroleum.

And having done so successfully with the heaviest of crudes without showing any deposit after weeks of running, the efficiency of the fuel-feed system and the completeness of the combustion appear to be conclusively proved. The freedom from electrical failure, the ignition being of the hot bulb kind, blow-lamp started and self-sustained by the repeated combustion, is also an advantage for any industrial service, wholly—to use the pet vulgarism of the aviation world—priceless.—G. de H.-S.

The Case of Autogenous Welding—III.

BY ARTIFEX.

So far the proposition of autogenous welding sounds like a very formidable matter; one to be approached if not by prayer and fasting, at least not one for angels to rush in upon—at Notting Hill Gate or elsewhere—where plain male fools have feared to tread, advisedly. Still a little perpending of a few things—of how it gets its name, for instance—may assist. When it is understood that "autogenous" welding means the absolute union of two pieces of metal by *pure fusion*—that is to say, sufficient but not excessive softening of the parts in contact—and *without* the interposition of any foreign body or element, then the working scheme and its ideals will be comprehensively grasped.

Now the essential condition is that this sort of welding shall be effected, consequently, with some combustible which has no action on the metal such as carbonisation, quite apart from the oxidising already mentioned. Of all combustibles then, hydrogen *only*, so far, *completely* fulfils this condition: as was long ago clearly established by the French Society of Civil Engineers, to say nothing of workshop practice. Acetylene gas, on the other hand, has the fourfold inherent defects of carbonising the metal, volatising it and giving off carbonic oxide gas, as well as presenting greater danger of explosion.

On this last account alone, local authorities may object—they do in France—to welding installations using acetylene being set up without all sorts of vexatious if necessary restrictions. It is thus doubtful whether portability of the plant—one of the most attractive features of autogenous welding as an industrial proposition—would not thus be rendered out of the question.

Acetylene versus Hydrogen.

But here is the great technical difference: and the defect of acetylene. It has been claimed that oxy-acetylene welding is easier—than oxy-hydrogen, for instance—and more reliable because—another mere circumstantial claim—it is "easier to regulate." Yet one soon comes to see the hollowness of these claims, first, because there is nothing to prevent rapid-action regulating devices being invented and employed for oxy-hydrogen welding—in fact, the Société Oxyhydrique Française, of 2, Rue Nouvelle, Paris, has, or had, an entire outfit on these lines that worked perfectly; and secondly, because in the latter case the *proportions* of the gases in the flame can be varied fairly widely. This does not appear to be the case with acetylene, in which, apparently, the size of the *flame* and its intensity only can be varied.

So we see that this amounts to but a single regulation after all: and that it merely ensures a combustion *nearly* completed, that is, some 95 per cent. or so. Which "nearly" is again a mile off, or might as well be; for never being "quite," it is just that little difference which sets up that infinitesimal carbonisation that makes the weld nearly always brittle.

Not that the oxy-acetylene system is without its uses. Where no actual stresses exist, or are likely to be set up, there is no doubt as to its value: but those are not the conditions of aeroplane construction, apart from the water-jacketing of motors or the making up of manifolds.

The Absence of Carbon.

Hydrogen, on the other hand, displays a greater superiority over any other combustible gas—at present commercially available—for the purposes of autogenous welding. Because, giving in no circumstances the slightest carbon deposit, and, further, devouring all the oxygen it can get, one can use it in *excess* and so make the flame a reducing one without fear of deteriorating the metal chemically either by carbonisation or oxidation.

Whereas, with acetylene or any other gas in which carbon is present, once the metal is ever so slightly carbonised, it is irremediably carbonised. Again, with the latter, nothing is easier than to get an excess of oxygen into the flame, beyond what the acetylene takes up: which, of course, goes to oxidise the metal just to that slight extent that would never be noticed until the job was finished, and perhaps not then.

Thus one important test by a leading French metallurgical Society showed that of five samples of oxy-acetylene welding taken at random, four were slightly oxidised, and the fifth carbonised, which leads one to believe that the realisation of a true neutral flame—a regular result with oxy-hydrogen—is practically impossible with acetylene.

Electric Welding.

Again, more than one test of electric welding has shown that its defect is the difficulty—practically the impossibility—of regulating the heat. This is destructive to the solidity of the weld, which is rendered non-malleable. Whereas, to get a really sound autogenous weld, it is a cardinal rule never to work up to any heat beyond that at which the metal just runs slowly: the slower the better.

Here we get to the real bone of the matter. Most often, the two pieces to be welded are of the same metal; albeit one can just as well weld two different plain metals, *provided always* that their fusion temperatures are not very widely different. But it is in any case essential that the flame used shall be *chemically* neutral, and it will be easily seen not only that were that flame anything else, but that were the temperature excessively beyond fusion-point, that very excess-heat might well bring about chemical change owing to the presence of the surrounding atmosphere or its accidental impurities.

High-Tension Methods.

Originally, high-tension electric current was expected to afford the realisation of the always attractive idea of autogenous welding. Everybody who knows the history of these matters will recall the interesting apparatus constructed generally under the Elihu Thompson patents, which was installed in many big French engineering works that had powerful supplies of electricity available. Similarly in England.

Nevertheless, in spite of its technical interest—even its advantages for certain work such as riveting—electric welding did not become popular, and one may safely say, will not, for the following reasons. It requires, essentially, a considerable installation of electricity as a source of current: the handling of the electrodes is dangerous and inconvenient; the temperature—as has been said—is practically non-variable; and, finally, the intervention of the electric arc itself creates an immediate atmosphere positively charged with carbon: of all elements the most fatal to autogenous welding!

Thermit.

Then there was the famous "Thermit" process devised and patented in Germany, where scientific "education" is so high: real vision, and understanding of the fundamentals of a technical proposition in inverse ratio, one notices. Immediately everybody imagined that there at last was the simple solution of the autogenous proposition.

There was heat enough, and quick enough. In fact, that of the very Pit, ten times too much of it and too quick. Also necessitating all sorts of bother and complications in fitting the most accurate of moulds round the pieces to be welded. To have made the process effective, these moulds should have been given some approaching motion of the most gradual kind, like the follower-screw of a lathe, which, in the very nature of such welding, would have been mechanically impracticable.

Back to the Blowpipe.

So we have been brought back out of these clouds of experiment to the fact that the only possible practice for autogenous welding is that of the blowpipe: for one knows that by burning at the nozzle of a blowpipe a mixture of a combustible gas with

IMPORTANT TO AEROPLANE BUILDERS.

To those building or tendering for Aeroplanes it might interest them to know that we hold complete tools for many of the components of the following machines:

B.E.2C-D-E & B.E.12. R.E.7 & R.E.8.
F.E.2B & D. F.E.8. S.E.5.
SOPWITH (110 h.p. CLERGET & F.I.).
AVRO, BLERIOT and H. FARMAN.

All kinds of tube manipulation can be effectively dealt with at our works.

We also have excellent facilities for coping with
PRESSWORK, SOCKETS, FERRULES, TUBULAR OR SHEET-METAL FRAMEWORKS.

Please send details of your wants.

The work at present in hand for the above includes RUDDERS, FINS, ELEVATORS, STAYS, SOCKETS, CLIPS, LEVERS, EXHAUST SETS, WIRING PLATES, &c.
A complete up-to-date list of parts in stock or in progress will be sent on application.
WE MAKE ALL SIZES AND TYPES OF TUBULAR BOX SPANNERS.

WE CAN DELIVER

one that is active to combustion—such as oxygen—one can get any required temperature in the range of practice.

The active gas is, of course, always oxygen, either by itself—rarely, except for cutting work—or mixed with nitrogen to weaken it; in this case, of course, provided by the surrounding air; while the combustible gas is either hydrogen or its mixtures with carbon derivatives, such as town-gas, water-gas, acetylene, ether, oil-gas, etc.

Oil-gas, as one sees from the foregoing, is an "unlikely" mixture, only to be used when nothing else is available. Always the aim has been to find the means of producing, with a blowpipe, not only an absolutely neutralised flame with complete combustion, but also a *homogeneous* one: but the fear of explosions had mainly hindered the idea of making the mixture of two gases prior to their being lit. So they have been led by parallel—but always separate—channels to two nozzles converged one towards the other. So it is easy to see that in these circumstances the production of such a flame presented all sorts of apparent difficulties.

Thus it was an undoubted revolution in the welder's craft that the Société l'Oxyhydrique brought about when for the first time the mixture of the two gases was effected in the actual body of the blowpipe, before they were lit; thus creating the homogeneous mixture for the homogeneous flame, free of all carbonising influences, for the benefit of autogenous welding.

(To be continued.)

A PROMISING COMBINATION.

His many friends in the Aircraft Industry will be interested to know that Mr. J. D. North has been appointed designer to Boulton and Paul, Ltd., of Norwich. The combination should be of advantage to all concerned.

Boulton and Paul, Ltd., being, as their past history shows, thoroughly modern in all their ideas, have made up their minds that no matter when the war may end they intend to remain in the aircraft business and to secure a large share of whatever business is going, either in this country or abroad. They are also determined that the Boulton and Paul aeroplane which they will place on the market shall be an original production and not merely a reproduction of somebody else's designs. With such a policy in view, it is naturally necessary for them to secure a first-class designer, and in securing the services of Mr. J. D. North they have found a man with originality of idea and at the same time sound technical knowledge to balance his originality.

Mr. J. D. North.

Mr. North's technical career is distinctly of interest. He was educated at Bedford Grammar School and received his more highly technical instruction by private tuition. In his youth, for reasons of health, he travelled for six or seven months along the Mediterranean littoral and in Russia and Turkey, thus acquiring that breadth of view on international affairs which was the motive idea in those happy days when no gentleman's education was complete unless he had made the "Grand Tour."

On his return to England he served his time in the shops with a firm of general and marine engineers at Southampton, and later on he was employed in the shipyards on Queen's Island, Belfast. Between these periods he endeavoured to build an aeroplane in conjunction with Mr. H. A. Myers, now Captain, A.I.D. His first public operation in connection with aviation occurred when, in the early days of The Aeroplane, a competition was held in the form of an examination paper on purely practical technical points. The judge was Mr. W. O. Manning, one of the pioneers of scientific aeroplane design in this country, and at that time associated with Mr. Howard T. Wright. Mr. North won this competition with the greatest ease, obtaining full marks for practically every answer.

Possibly owing to the confirmation thus given of his knowledge of aeronautics, Mr. North left Belfast and decided to adopt aviation as a profession. He joined the Aeronautical Syndicate, Ltd., which had been formed some time before by Mr. H. C. Barber, now Captain, R.F.C., and he assisted in the manufacture of the Valkyrie machines. When the Aeronautical Syndicate expired, Mr. North joined the Grahame-White Co. in a technical capacity, shortly afterwards becoming chief designer, and later works manager.

Various machines, mostly successful, were produced by his efforts, and in 1913 he was elected an Associate Fellow of the Aeronautical Society. In 1915 he joined the Austin Motor Co. as superintendent of the Aeroplane Department, and has done much good work in that capacity, including the production of a small machine possessed of a remarkable performance. In 1917 he was elected Fellow of the Royal Meteorological Society.

Knowing something of Mr. North's ideas as to the performance necessary in war aeroplanes and as to the possibilities of machines which will give such a performance with adequate strength, one does not hesitate to prophesy interesting developments in his future designs.

SUNBEAM EMPLOYEES' CHARITY SPORTS.

The second annual Charity Sports, promoted by the employees of the Sunbeam Motor Car Co., Ltd., took place on August 18th in aid of local charities and organisations for wounded soldiers.

The results were as follows:—

100 Yards Girls' Flat Handicap.—1st, C. Evans; 2nd, M. Healy; 3rd, A. Davis.

100 Yards Flat Handicap (Employees).—1st, J. Lane; 2nd, W. H. Edge; 3rd, J. Oakley.

150 Yards Scholars' Flat Handicap.—1st, J. Pearson; 2nd, J. C. Hand; 3rd, L. J. Ford.

Half-mile Cycle Handicap (Employees).—1st, G. Sargent; 2nd, H. Justice; 3rd, T. Willetts.

Three Lap Works' Relay Race.—Winning team, Electric Construction Co.; 2nd team, Sunbeam A Team.

80 Yards Girls' Three-legged Race (Employees).—1st pair, M. Healy and C. Evans; 2nd pair, E. Stockton and S. Jones; 3rd pair, F. Smith and A. Morton.

Tug of War.—Winning team, Test House; 2nd team, Mr. Broadbent's Department.

Wounded Soldiers' Race.—1st, Cpl. Fergueson; 2nd, — Hope; 3rd, — Shipstone.

Comical Costume Parade.—1st, E. Williams; 2nd, G. H. Roulston.

220 Yards Works' Flat Handicap.—1st, W. Hindes; 2nd, J. Lane; 3rd, H. Cooper.

Half-mile Flat Handicap (Employees).—1st, W. Pace; 2nd, W. E. Harrison; 3rd, J. Oakley.

One Mile Walking Handicap (Employees).—1st, T. Roker; 2nd, J. H. Roulston; 3rd, W. Tomkinson.

One Mile Flat Handicap (Employees).—1st, A. Wakeman; 2nd, A. Hudson; 3rd, F. McCarthy.

100 Yards Flat Handicap (Open).—1st, W. Pearson, Willenhall; 2nd, J. A. Walkedon, Walsall; 3rd, H. May, Wolverhampton; 4th, J. Goodman, Walsall.

Half-mile Cycle Race (Open).—1st, J. Vincent; 2nd, W. Titley; 3rd, D. E. Owen.

One Mile Cycle Handicap (Open).—1st, W. Titley; 2nd, J. Vincent; 3rd, D. E. Owen.

220 Yards Flat Handicap (Open).—1st, W. Gill; 2nd, J. A. Walkedon; 3rd, J. Flint.

440 Yards Hurdle Handicap (Open).—1st, G. H. Shelton; 2nd, H. May; 3rd, F. A. Landucci.

At the conclusion of the sports the distribution of prizes was made by Mr. Clement B. Kay, the firm's works manager.

Spencer, A. C., and others. Balloons for signalling, etc. No. 11,714. August 15th.

Tarrant, W. G. Wings, etc., for aeroplanes. No. 11,850. August 17th.

Thompson, H. A. Device for tightening or loosening wires of aeroplanes, etc. No. 11,804. August 16th.

Complete Specifications Accepted, prints of which can be obtained on and after September 6th, 1917.

08,535. August 14th, 1916. Blackburn Aeroplane and Motor Co., and Sayers, W. Method and means of minimising the resistance of airships, marine vessels, and other bodies moving through fluid.

108,598. November 1st, 1916. Sopwith Aviation Co., and Sopwith, T. Wind screens for the pilot, observer, or gunner upon aircraft.

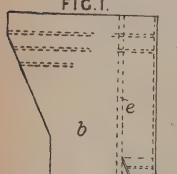
108,625. December 14th, 1916. Johnson, B. Steering and balancing of aeroplanes.

Abridgments of recently published Specifications.

107,208. Aeronautics. Robson, J., 38, Hawthorne Road, Bexley Heath, Kent.

Planes, construction of.—The wings of aerial machines are each provided between the upper and under sides and in front of the customary front spar with a forwardly facing step or surface which is adapted to compress and deflect below the wing the air passing under the leading edge. As shown applied to an aeroplane wing, the step is formed by a spar *g* secured at an angle to the front spar *e*. The upper surface *a* of the wing is continuous, but the lower surface *b* is discontinuous in front of the spar *g* so that the front face of the spar *g* is exposed to form a step. The step may extend beyond the end of the spar *g*, part of the front spar *e* being exposed to act as a step. The body of the aeroplane may be shaped to assist in deflecting air below the wing or a deflecting plate or plates may be attached to the body for this purpose. The step may be permanently exposed, or a hinged or flexible screen or screens *j* may be provided so that the step can be covered or exposed at will.

FIG. 1.



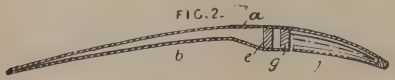


FIG. 2.

THE AIRCRAFT RAG.

The fourth issue of the "Aircraft Rag," the monthly works magazine of the Aircraft Manufacturing Co., Ltd., is as successful as were the earlier numbers. The illustrations and text continue to preserve a high standard, and the production is both instructive and amusing. The number of advertisements which the magazine now carries is quite surprising, and reflects the confidence with which the magazine is regarded, not merely by other aircraft firms, but by local tradesmen who are anxious to do business with the numerous employees of the A. M. Co., Ltd.

MARKET REPORTS.

Prices given are for quantities on usual terms.

August 23rd, 1917.

COPPER.—The chief interest centres round the situation in America. In the first place, the labour difficulties there are far from being settled, although one is given to understand that the Butte Council will probably accept the terms offered by the Anaconda Copper Mining Co. Secondly, the Washington authorities have not yet fixed the prices to be charged for metal required for war purposes. One is given to understand that the trouble in Spain is now affecting the Rio Tinto Mines, the men there having gone on strike. If the information is correct, then it is hoped that the dispute will soon be settled.

As forecasted in our issue of the 8th inst., there has been a further reduction in the price of Copper Ingot, but the prices of Electrolytic Sheets, etc., have not yet been adjusted. The whole position of this market is at present obscure.

Current Prices.

Standard Copper	£120 per ton, Cash.
Copper Sheets	£160 per ton.
Copper Tubes, S.D.	19½d. per lb.
Brass Sheets, 24 Gauge	15⅝d. per lb.
Brass Tubes, S.D.	16½d. per lb.

TIN.—The business done in Tin has not been very brisk, in fact, a dull spell, which, however, has indications of only being temporary, has set in. America is getting her Tin from the Eastern markets, but the demands from that direction are not very great at present. The position here appears to be primarily influenced by the shipping situation, although there are other factors to be watched. It is likely that the market will become much firmer.

Current Prices.

August 22nd	£242	5	0
August 18th	243	0	0
August 14th	242	5	0
Highest Price, 1916	205	0	0

LEAD.—There appears to be plenty of Lead for war requirements. In spite of the labour difficulties in Spain, the official prices are, however, still maintained. The entire market is in a very dull condition.

Current Average Prices.

Pig Lead (Foreign)	£30	0	0
Last Year	29	3	9

STEEL.—The works are now in their stride again, and the long break for August Bank Holiday was certainly appreciated by both the masters and the men. The demand is undiminishing, in fact, it is increasing very considerably; this is particularly applicable to Aircraft Steels. The output of the latter is very favourable. There is, however, a very grave shortage of one or two special Steels. There has been no alteration in prices for some considerable time, and there does not appear to be any indications of any alterations at present. Cast Steel continues to advance in price, and it is more than likely that it will continue to do so. The Air Board have not yet officially notified manufacturers of the prices to be charged for the Steels they are controlling.

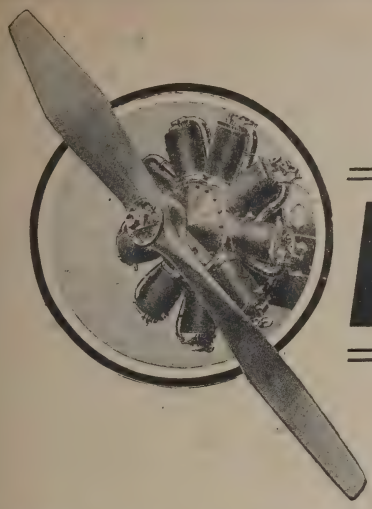
Current Average Prices.

R.A.F. 3B Steel, 36s. to 40s., per cwt. Basis. (Black or Blue Reeled).

R.A.F. 1E Steel, 78s. to 80s. per cwt. Basis. (Black or Blue Reeled).

R.A.F. 9A Steel, 30s. to 32s., per cwt.

ALUMINIUM.—Supplies are very satisfactory indeed, and the official prices remain unaltered.



Official Prices.

Ingot	£225 per ton.
Remelted	210 per ton.

TIMBER.—The Timber position is still very acute, in fact, it is now practically impossible to procure the wood which is more extensively used in aircraft construction, viz., Silver Spruce.

One is given to understand that the A.I.D. are exercising a stricter "cast-iron" inspection of wood parts, and there does not appear to be any hope of them modifying it. One is not advocating the use of unsatisfactory wood, but in view of the shortage of Timber, due in one's estimation to inefficient and short-sighted control, one suggests that there are reasonable grounds for the inspection of wood parts; the A.I.D. have apparently reached the utmost bounds of the unreasonable. About 20 per cent. of the material which has been imported by the Air Board is suitable for making parts to pass present-day A.I.D. Inspection. It will be observed that the position is getting very desperate, and manufacturers are anxiously waiting for developments.

There is still a serious shortage of Walnut, and although there are supplies of Mahogany to be procured, one would like to see larger shipments of first-class material arriving. Prices of all

woods continue to advance; this is particularly applicable to Mahogany.

Current Average Prices.

Silver Spruce, 17s. 6d., c.f.
English Ash, 13s. 6d. to 15s., c.f.
Walnut, 2s. 3d. to 2s. 6d., s.f.
Mahogany, 2s. 2d. to 2s. 4d., s.f.

Prices include selection and delivery.

FABRIC.—There are ample supplies at present of both Fabric and Spaced Material. There are also fairly good supplies of Egyptian and India Tapes. Is it a fact that the Air Board are making 10 per cent. profit on all Fabric, and Missed Thread Cloth delivered to aircraft firms? If this is correct, it would be interesting to know what this 10 per cent is for, seeing that the material is delivered direct by the spinners, and the Air Board have no handling, packing, or delivery charges to bear. The price is certainly atrocious, and one understands that the spinners consider it is a downright swindle. One gives below a comparison of prices. Careful comparison will, one thinks, confirm the Belfast spinners observations.

Comparison of Prices.

17C Cloth, 36 in. wide.—Feb., 1917.....2s. 8d.
(Official price fixed August, 1917, presumably retrospective.)
17C Cloth, 36 in. wide.—Nov., 1916...1s. 11¾d.
17C Cloth, 36 in. wide.—Feb., 1916 .....1s. 9d.

The above prices cover 17B and C Cloth.

THE AUSTIN TECHNICAL SOCIETY.

A meeting was held recently of the Austin Technical Society, which was founded on May 2nd with the object of promoting among the Austin Co.'s employees the study of engineering and other branches of applied science. The President of the Society is Mr. Herbert Austin, who is not only one of the pioneers of motoring in this country, but has also long been keenly interested in aeronautics.

At the recent meeting the Hon. Organising Secretary, Mr. A. E. Astington, explained that it was obviously impossible to get into full working order at once. As soon as the officers were appointed, the Management Committee proceeded to form sub-committees to deal with the three most important matters in connection with the Society, viz., the formation of the Library, the arrangement of a series of lectures and the establishment of technical education for the members. It can easily be seen that much time and thought had to be devoted to the consideration of these vital matters, and the Sub-Committee thus formed had been most unremitting in their labours.

The Library, as being the most obviously useful of the Society's operations, demanded first consideration. Very considerable progress has been made, and already many books have been received. In addition, the Chief Librarian to the Birmingham Corporation (Mr. Walter Powell) has been consulted and has prepared a list of standard works on subjects submitted to him by the sub-committee, and the assistance which this gentleman has voluntarily given has been of the greatest value to the Society.

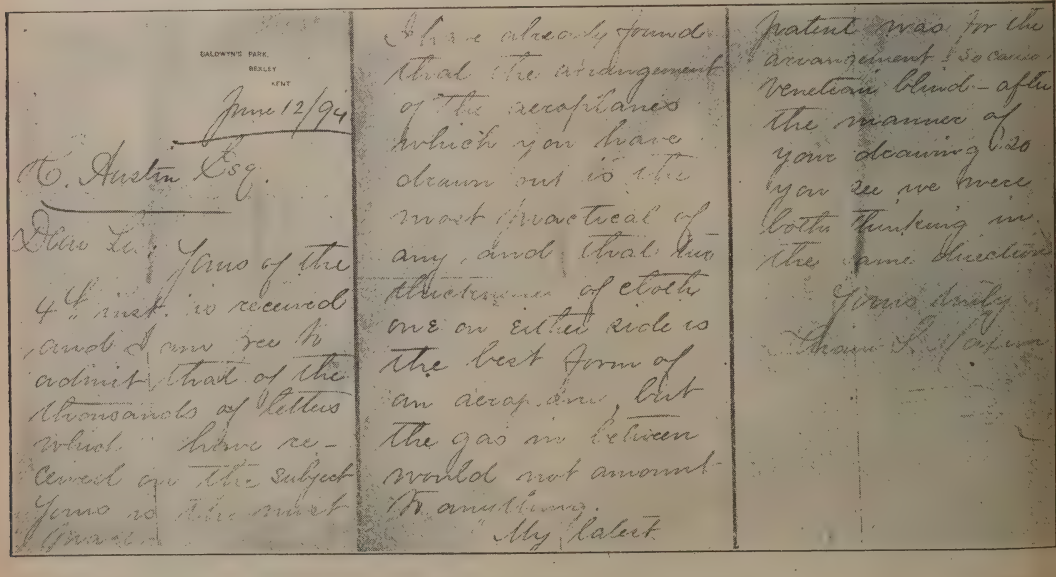
The Society is also receiving regularly a number of high-class technical journals. A list will shortly be prepared and circulated amongst the members, pending the provision of suitable library and reading-room accommodation, though it is hoped that this will very soon be available.

It was not possible at the moment to arrange for the issue of books and periodicals, as the necessary machinery, though in course of preparation, was not yet ready.

As to the scheme of lectures for the forthcoming session, it is hoped to arrange for the highest authorities on their particular subjects to address the Society, and negotiations have already been opened to this end, but it would be premature to give details yet.

Members, however, can give assistance to the Lecture Sub-Committee by making suggestions as to subjects which might form the basis of discussion between members of the Society, as the feeling of the Committee is that debates are both helpful and instructive, and by such means members can become better acquainted with one another than is possible where they are addressed by a lecturer unknown to them except perhaps by name.

Technical education has also received the earnest consideration of a sub-committee, and negotiations are in progress with the City of Birmingham Education Committee to give instruction to those members desiring it in a very wide range of technical subjects at specially low fees. It is also probable that courses of tuition, conducted by one of the largest correspondence schools in the country, will be instituted, and in this connection members will be glad to hear that this particular school has most generously given to the library a complete set of its instruction books, comprising 75 volumes, which will be especially valuable to the younger members.



The Advisory Council is in process of formation and numbers, up to the present, 29 members, representing each branch of activity carried on in the works. The Committee hope that any member, of whatever grade, who considers that he is qualified to give advice on any subject, or wishes to nominate another member to a seat, will communicate with the Secretary at once.

Forms of application for membership are now ready, and can be obtained either from the Secretary or through any member of the Committee.

THE DAVIDSON AVIATION CO.'s OUTING.

The Davidson Aviation Co., Ltd., held their first annual works' outing on Saturday, August 18th.

The party left Richmond at 9.30 a.m., and except for a few showers in the early morning, it turned out to be a glorious day. Lunch and tea were supplied at the "Cricketers Arms" at Chertsey. A sports' programme was arranged for the afternoon, and this was carried out very successfully, the main feature of which was the "tug-of-war" for the men and the girls. The directors presented a silver cup to the winning team, and each man of the successful team received a pipe. The cup will be held by the winners for 12 months.

BALDWYN'S PARK,
BEXLEY
KENT

June 12/94

H. Austin Esq.

Dear Sir, Some of the 4" inst. to received and I am free to admit that of the thousands of letters which have received on the subject some of the most

I have already found that the arrangement of the aeroplanes which you have drawn out is the most practical of any, and that the attachment of cloth one or either side is the best form of an aeroplane, but the gas in between would not amount to anything.

My patent was for the arrangement of so many Venetian blinds - after the manner of your drawing 0.20 you see we were both thinking in the same direction.

Yours truly
Hiram S. Maxim

AN INTERESTING RELIC.—A letter from the late Sir Hiram Maxim to Mr. Herbert Austin, now of the famous Austin Motor Co., Ltd. The letter demonstrates Mr. Austin's early interest in aviation and his practical ideas on aeroplane design twenty-three years ago.

(*Continued from page* 578B.)

and reconnaissance work was also carried out. In the course of the day and night five tons of explosives were dropped on various objectives behind the enemy's lines.

August 25th, 9.29 p.m.—The customary work of our aeroplanes was continued yesterday in spite of unfavourable weather and high westerly winds. The enemy's aircraft showed little activity. In air fighting one German aeroplane was brought down and one other driven down out of control.

Three of our machines are missing.

August 26th, 9.34 p.m.—Owing to stormy weather there was little aerial activity yesterday until the evening, when successful artillery work was carried out by us with aeroplane observation, and some fighting took place. Three German machines were brought down and four others driven down out of control.

Two of our aeroplanes are missing.

August 27th, 9.30 p.m.—Bombing raids and observation work for our artillery were carried out vigorously yesterday by our aeroplanes, and the enemy's batteries, transport, and infantry were effectively engaged with machine-gun fire.

During the fine intervals the enemy's aircraft were active and aggressive. In air fighting, four German aeroplanes were brought down and three others driven down out of control.

Two of our machines are missing.

War Office Communiqué.

August 24th.—The G.O.C. the British Forces in Macedonia reports:—

During the past week our aeroplanes have dropped bombs on the enemy's dumps at Sarmusakli (south-east of Seres), Dutli (north of Seres), and Demirhissar (all places on the Struma front). We have also, in conjunction with Allied machines, raided Prilep (north of Monastir) and neighbouring places.

Home Command Communiqués.

August 22nd, 11.15 a.m.—Enemy airships—numbers not definitely ascertained—appeared off the Yorkshire coast last night.

One of the raiders attacked the mouth of the Humber, and was fired on by anti-aircraft guns. She dropped some bombs and then made off to sea.

The damage so far reported is slight, but one man was injured.

4.10 p.m.—Later reports show that, although a number of enemy airships approached the Yorkshire coast last night, only one, or at most two, ventured to come overland.

Twelve high explosive and 13 incendiary bombs were dropped at three small villages near the coast; a chapel was wrecked and several houses damaged.

One man was injured.

August 22nd, 1.10 p.m.—Ten enemy aeroplanes approached the Kentish Coast near Ramsgate at about 10.15 a.m.

Being met and heavily engaged by machines of the Royal Flying Corps and Royal Naval Air Service, as well as by gunfire from anti-aircraft guns, the raiders were unable to penetrate inland.

A small party travelled west as far as Margate, but then turned homeward. The remainder skirted the coast to the south as far as Dover.

Bombs were dropped at Dover and Margate.

Casualties reported at present are three persons killed and two injured. The material damage is slight.

Two of the enemy machines were brought down by anti-aircraft gunfire and our own aeroplanes.

3.35 p.m.—The latest police report shows that bombs were dropped by the raiding aeroplanes this morning at Dover, Margate, and Ramsgate.

No casualties occurred at Margate, but at Dover and Ramsgate 11 persons were killed and 13 injured. A hospital and a number of houses were damaged.

One of the enemy pilots was rescued, having been only slightly injured.

The Casualty List.

Reported August 22nd.

Killed.—Meudell, Sec. Lt. C. G., R.F.C.

Previously reported Missing, now reported Killed.—
Bates, Sec. Lt. A. H., R.F.C.
Brandon, Lt. E. T. C., R.F.C.
Muir, Sec. Lt. J. H., R.F.C.
Pell, Sec. Lt. H. S., R.F.C.
Powell, Lt. P. J. B., A.S.C., attd. R.F.C.
Sworder, Lt. H. P., R.W. Surrey R., attd. R.F.C.
White, Sec. Lt. B. W., Liverpool R., attd. R.F.C.
Williams, Sec. Lt. V. F., R.F.C.

Accidentally Killed.—Sheehan, Lt. C., R. Muns. Fus., attd. R.F.C.

Wounded.—Binnie, Lt. A., R. Scots, attd. R.F.C.
Edmunds, Lt. P. M. L., Lancers, attd. R.F.C.

MISSING.

AUGUST 17th.—R.F.C.—Wickham 27234 Cpl. W. S. (Norwich).

PREVIOUSLY REPORTED MISSING, NOW REPORTED PRISONER OF WAR IN GERMAN HANDS.—AUGUST 14th.—R.F.C.—Lloyd 78758 2nd Cl. Air Mech. C. (Swansea).

PERSONAL NOTICES.

DEATHS.

BROOKS.—Sec. Lt. Francis Cyril Brooks, R.F.A., attached R.F.C., who was killed on August 17th in a flying accident, was the elder son of Capt. and Mrs. J. C. Brooks, Sarsdenfield, Camberley. He was 19 years of age.

BROWN.—Lt. Ewart Cudemore Brown, Canadian Infantry, attd. R.F.C., who was killed while flying in England at the age of 24, was the eldest son of Mr. and Mrs. V. O. Brown, of St. George's, Bermuda, and nephew of Mr. and Mrs. C. H. Cudemore, of Loughton, Essex. He was born in St. George's, Bermuda, and after leaving school went to the British Bank of Montreal, where he was when war was declared. He enlisted in the company formed by the McGill Institute, Montreal, of which he was a member, and after training in England he went to the front early in 1915. He was invalided home, and afterwards served in the Accountants' Department of the Canadian Pay Office. He again volunteered for the front, joining the Cadets and gaining his commission. Later he was attached R.F.C., and it was during his first flight alone that he was accidentally killed.

BRUFTON.—Sec. Lt. Harold Charles Brufton, Rifle Brigade and R.F.C., killed in a fight in the air on July 8th, was the third son of Mr. Harry D. Brufton, of Croftdown, Wanstead. After serving a short time in France he went to Egypt on January 3rd, 1916 (his 21st birthday), and joined the R.F.C. in November following. He took part in numerous raids with his squadron and had several fights with enemy machines.

CASTELL.—First-Class Air Mech. G. C. Castell, R.F.C., was killed in a railway accident when returning after completing a machine-gun course in preparation for a commission as a flying officer. Mr. Castell, who was 24 years old, was a trained engineer, who had served his time in the shops, and was engaged as a draughtsman at the outbreak of war. Within the first few weeks he joined the London Regt. as a private, going to the front at the beginning of 1915, and seeing hard fighting at Givenchy, Loos, and elsewhere. After about 18 months of this service he was transferred to the R.F.C. for the repair and maintenance of aeroplanes, and had been recommended for the commission for which he was preparing at the time of his death. His C.O. bears testimony to his keenness both as a soldier and as a mechanic, and the head of the works at which he served his time records an exceptional combination in him of an amiable and peaceful disposition with a relentless attachment to his duty. Mr. Castell, who was a vigorous Rugby footballer and on service became an excellent shot, was the only child of Mr. G. H. Castell, for many years engaged in the service of the Surrey Commercial Docks.

CLIFTON.—Sec. Lt. William Gerard Talbot Clifton, Oxford and Bucks Lt. Infty. and R.F.C., who died of wounds on March 31st, 1917, while a prisoner of war at the field hospital at Corbehem, was the eldest son of Mr. and Mrs. W. C. Clifton, of Stoke Poges, Bucks, and 21, Elm Park Gardens, S.W.

COBB.—Lt. John Elbridge Cobb, A.S.C., attached R.F.C., who was killed in action on August 14th, was the elder son of Mr. and Mrs. John Austin Cobb, late of Richmond, Surrey. He was 20 years of age.

CRAIG.—An inquest was held on August 22nd at Ilford on Lt. George Robert Craig, M.C., East Lancs. Regt., attd. R.F.C., who was killed in an Essex aerodrome on August 19. Capt. McKay said that the deceased officer was an experienced aviator, and had been up for forty minutes previous to the accident. The machine was in perfect condition, and Mr. Craig went up a second time and engaged in fighting practice with his Flight Commander. After manœuvring for some time the pilot came down a thousand feet in a spin. He recovered himself from this, but immediately the machine began to spin in the opposite direction and crashed to earth. Dr. Brought, who witnessed the accident, expressed the opinion that Mr. Craig must have fainted in mid-air. Death was instantaneous. The jury returned a verdict of death by misadventure.

DIXON.—Capt. Henry Eric Dixon, Middlesex Regt., attached R.F.C., who was accidentally killed while flying, on August 19th, was the eldest son of the late Albert Edward Dixon, solicitor, Cardiff, and of Mrs. H. B. Dixon, of Downton House, Stonehouse, Gloucestershire. After being educated at Waynfleet and Bradfield College, he was at Leeds University, then at the Wolseley Works, Birmingham, and later with the Cleveland Bridge Engineering Company. On the outbreak of hostilities he joined the Public School Corps, and was given a commission in the Middlesex Regt., being later transferred to the Royal Flying Corps, in which he obtained his wings with distinction, and at the time of his death was Acting Flight Commander. He was married only nine months ago to Miss Muriel Agnes Seymour Metford, younger daughter of Lieut.-Colonel F. K. Seymour Metford, R.F.A., and she survives him.

DOW.—An inquest was held at Dartford on August 25th on the body of Lt. Allan G. Dow, R.F.C., a Canadian who, on August 16th, while flying, came into collision with another machine and fell into the River Thames and was drowned. The body was recovered on August 23rd.

Major R. F. Maxwell said Mr. Dow came from Ottawa. When 1,000 ft. up he came into collision with a machine, the pilot of which was rescued and is now in hospital suffering from shock. From his statement it appeared that he was doing a "spiral"

from 2,500 ft. up and he did not see the other machine till he was five yards away from it. He tried to escape collision but failed, and Mr. Dow's machine nose-dived into the river and was completely wrecked.

Several jurymen asked questions with reference to the number of recent flying accidents, and whether the machines were "dud" ones, but it was stated that the machines could not be bettered for purposes of instruction. A question as to whether the pilot was playing "fancy games" when the accident occurred was answered in the negative.

A verdict of death from misadventure was returned.

FULLALOVE.—Sec. Lt. G. Y. Fullalove, late H.A.C., who was killed in action on August 13th at the age of 20, was the son of Lt. and Mrs. Fullalove, of Inglenook, Coulsdon, Surrey.

HARRIES.—At Angmering, West Sussex, on August 21st, Lt. Harries was killed by his machine falling into a meadow on the Ecclesden Farm estate. From the nature of his injuries death must have been instantaneous.

HUNT and FINLEY.—It was reported from North Wiltshire on August 22nd that Lt. Alfred Stanley Hunt, R.F.C., and Sgt. Charles Finley, R.F.C., have been killed as the result of a collision in the air between two aeroplanes. Their machine came into collision with another aeroplane, the pilot of which had a remarkable escape, for, although the propeller of his machine was broken, he managed to land in safety.

JORDAN and HANDLEY.—Mr. Gilbert H. White, Coroner for West Surrey, held an inquest at Addlestone on August 22nd on Lt. Hugh Stewart Latimer Jordan, R.F.C., and Sgt. E. Handley, R.F.C., whose deaths were announced last week. Describing the accident, John Hoare, a gardener at The Grange, said about 10 o'clock on August 20th he saw two machines in the air, one above the other. Suddenly there were two explosions, and the lower machine came straight down for some distance, when it straightened out, and then the right wing folded back onto the body of the machine. It next took a horizontal course for some distance with one plane, which also suddenly folded back. The machine then pitched over some trees into a field. Witness ran across and found Mr. Jordan and Sgt. Handley under the engine dead.

Evidence was given that the machine was in perfect order when it went up from Brooklands aerodrome. Capt. Cecil Faber, R.F.C., said Sgt. Handley was acting as pilot and was instructing Mr. Jordan as an observer. Lt. Barrie Young, R.F.C., said he saw the machine come down with a spinning dive from 3,000 ft. A verdict was returned in each case of death from misadventure.

Mr. Jordan was a son of Mr. H. S. Jordan, Napier Road, Wembley. He joined the H.A.C. in January, 1915, and went to Egypt in the following May, returning to England last year. He was then given a commission in the Reserve of Officers in the Field Artillery. After serving in France for seven months he returned to England, and was being trained as an observer when he was killed. Sgt. Handley had flown in France and had received the Médaille Militaire from the French Government.

KEBBLEWHITE.—Sec. Lt. Fred E. Kebblewhite, Sherwood Foresters, attached R.F.C., who was killed in action on August 14th, was the son of Mr. and Mrs. James Kebblewhite, of Sydney, Australia. He was 30 years of age.

KEYSER.—On August 22nd Lt. Keyser, R.F.C., was flying at Hounslow when, from an unexplained cause, his machine nose-dived into a field at Heston. The aviator, seriously injured, was taken in an unconscious condition to hospital, where he died soon afterwards.

Mr. Keyser was youngest son of the late Edward Keyser, of Symrna, and Mrs. Keyser, and was 21 years of age.

On August 23rd an inquest was held. Lt. Balden said that Mr. Keyser had been at the depot for four days, and his flying experience was twenty-three hours sixteen minutes. The accident was probably due to inexperience or an error of judgment.

The coroner remarked that accidents were increasing at Hounslow.

Lt. McLean, R.F.C., said that he saw the machine with its nose going down. He believed that Mr. Keyser made an error of judgment, and that the nose was down too much. He was about 2,000 ft. up, and if he had pulled up the machine soon enough he could have righted her.

It was stated that death took place in hospital from fracture of the skull, and the jury found that an accidental nose-dive to the ground was the cause.

LAPERA and SLOANE.—A biplane in charge of Lt. Lapera and Air Mech. Sloane, flying from London to the Kentish Coast, alighted near Westerham on August 22nd, and upon leaving rose to about 600 ft. and then suddenly nose-dived into a meadow, where the machine burst into flames. Both occupants were killed.

MUNRO.—An inquest was held at Hendon on August 21st on Sec. Lt. Guy Horace Munro, R.F.C., who was killed there on August 18th. He was taking a machine from Farnborough, and owing to darkness intended to break his journey at Hendon for the night. He apparently misjudged his distance in landing in the aerodrome and turned his machine to avoid some telegraph wires. The aeroplane having lost speed, nose-dived and crashed. The jury returned a verdict of "Death by misadventure."

Mr. Monro was 24 years of age and lived at Twickenham.

NEALE and HOLLAMBY.—At the inquest at Brentford on August 23rd on the bodies of Capt. John Neale, R.F.C., and Lieut. Douglas Hollamby, R.F.C., who were killed at Hounslow on August 22nd, the evidence showed that they were using a dual control machine, and that Capt. Neale was instructing his companion in its use. The accident was attributed to Mr. Hollamby getting the machine in such a position that Capt. Neale could not pull it out. Had they been higher up, it was stated, it would have been righted. Mr. Hollamby had had only three hours' flying experience, and the machine was new to him.

The coroner expressed surprise that a man with so little experience should have control of a new machine, but added that he supposed that this was the only way to acquire knowledge.

A verdict of "Accidental Death" was returned.

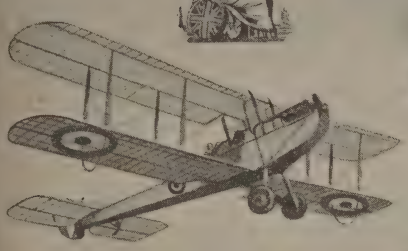
PETTIGREW.—Lt. Gilbert Thomas Richardson Pettigrew, Hereford Regt. and R.F.C., accidentally killed on August 12th while flying in England, was the younger son of the late Mr. William Pettigrew, of Warwick, and of Mrs. Pettigrew, of Hereford. He was born in 1892, and was educated at Warwick School, and became a journalist, afterwards leaving England for Canada to join the Staff of the "Winnipeg Telegram." He also served on the staff of the "Montreal Daily Mail." Subsequently he was appointed private secretary to the Minister of Public Works for Manitoba. He returned to England, enlisted in the Shropshire Light Infantry, and went to the front. Having been seriously wounded at Hooge, he came home, and at the end of 1915 was offered a commission in the Herefordshire Regt.

Shortly afterwards he transferred to the R.F.C., and again went to the front. He returned home at the end of May last after being found permanently unfit for war flying, and acted as an instructor in a training squadron. He was considered an excellent pilot, and was described by his C.O. in France as being "Steady as a rock."

PHIPPS.—Sec. Lt. Christopher Leckonby Phipps, R.G.A., attd. R.F.C., killed on August 14th, aged 20, was the third son of the late Mr. and Mrs. Gerald E. Phipps, of St. Albans. He was educated at Doon House, Westgate-on-Sea, and at Uppingham. He obtained his commission in the Special Reserve in August, 1915, and went to the front the following June. Last May he was transferred to the Kite Balloon Section, R.F.C., and met his death in a parachute descent.

POWELL.—Lt. Patrick John Gordon Powell, R.F.C., was the third son of Mr. and Mrs. Powell, of 18, Tudor Road, Upper Norwood, and was aged 20. He was educated at Cairnburn and Dulwich College, and joined the Public Schools Battalion in September, 1914. Later, however, he went to Sandhurst and received his commission in March, 1915. He served at the front from March, 1916, coming home in July to train for the R.F.C. Having received his pilot's certificate in October, 1916, he returned to the front. He was reported missing on April 2nd, and news has now come that both he and his observer were killed while flying on that date. He was a fine athlete and was very popular.

PURGOLD.—Sec. Lt. Louis E. Purgold, R.F.C., who was killed whilst flying at a home station on August 20th, was the second son of the late Emile Purgold and Mrs. E. Purgold, 3, Alexandra Drive, Sefton Park, Liverpool. He was 21 years of age.



REINCKE.—Capt. Leopold Frederick Reincke, Duke of Wellington's (West Riding) Regt., attached R.F.C., whose death was announced last week, was born in September, 1887, and educated at the Dulwich College Preparatory School and at Dulwich College. In Egypt when war broke out, he came home and obtained a commission in the Duke of Wellington's Regt. After completing his early training he was for many months in this country training troops, but in October, 1916, he went to the front, having in the meantime been promoted to the rank of captain. He took part in some of the later fighting of the Somme offensive, and during this summer he led his company in a great attack. Transferred to the Royal Flying Corps, he returned home, but went to the front again on August 8th, and was killed on the 17th while out on an offensive patrol "far over the enemy lines."

RODGMAN.—Flt. Sgt. Rodgman was killed while flying at Wolvercote, near Oxford, on August 20th. He was at a height of about 100 ft. when smoke was observed issuing from the aeroplane. The machine fell to the ground, blazing furiously. Sgt. Rodgman had flown from Northolt and was on his return journey when the accident happened.

ROWLANDS.—Lt. Arthur William Rowlands, R.F.C., was killed while landing in his machine in Lincolnshire just after midnight on August 15th. He was educated at the Liverpool College, Shaw Street, and graduated at the Liverpool University with the degree of LL.B., first-class honours, a month before the

AIR KIT SUPREMACY

THE man whose daily job is butting through the atmosphere at umpty m.p.h. gets a fine appreciation of clothing values. Haphazard isn't good enough for him in choosing kit. He goes to Dunhills.

Goes to Dunhills because he believes that what they learned in their long years of supremacy as motoring outfitters made a fine basis for the specialised study of air-outfitting. Goes to Dunhills because their supremacy in flying-kit is as clearly established as his own in flying-fighting.

Dunhills' supremacy means a clear lead in the vital point of efficiency, combined with economy—first, in cost; and afterwards, in service.

Leather Coats, made of the finest chrome dressed skin, light in weight, soft to handle and fitting like a glove, lined with finest fleece	£9 9s.
Tunic, in finest whipcord	£5 10s.
Breeches, best Bedford cord	£3 3s.

A copy of our Catalogue of Aviation Kit will be gladly sent on request.

Dunhills Ltd.

GLASGOW: 72, St. Vincent Street

outbreak of war. On September 12th, 1914, he was articled to Messrs. Bateson, Warr, and Wimshurst, solicitors, Liverpool, and joined the Liverpool Scottish the following month. After serving the first winter in the trenches with his regiment he was granted a commission in the A.S.C. while in France.

He then transferred to the R.F.C., served as an observer for six months, and came over to England, taking his wings in June. He was the only son of Mr. and Mrs. J. W. Rowlands, of 51, Newsham Drive, Liverpool, and was 22 years of age.

SOLLY.—Capt. Arthur Norbury Solly, Manchester Regt. and R.F.C., whose death was announced last week, was educated at Mostyn House, Parkgate, and at Rugby, where he was a scholar and exhibitioner, a member of the O.T.C., and for two years in the running VIII, and at Caius College, Cambridge, where he obtained an exhibition and had been in residence for a year before war was declared, intending to enter the medical profession.

In September, 1914, he returned from Switzerland, joined the Public School Brigade, and was soon promoted sergeant. He received a commission in the Manchester Regt. in October, 1914, and a year later was transferred to the Royal Flying Corps. He was wounded on July 1st, 1916, and in the autumn of that year qualified as pilot.

Since then he had seen much fighting, and was "Lt. C" referred to by the Special Correspondent of the "Times" in his dispatch, published on May 10th, describing how five British aeroplanes fought 27 Germans and beat them, "sending eight to earth crashing, crippled, or in flames." In this fight "Lt. C" saw his crippled comrade slipping downwards and saw the German diving after him. He followed, and before the German could do his work the British aeroplane was almost touching the tail of his machine, and in another second the German turned clean over in the air and then crashed.

Capt. Solly had been promoted Flt. Comdr. and temp. Capt. just a month before his death. His brigade chaplain writes of him as "one of our finest and best, and such a favourite, not only with his own squadron, but with others."

THORNDIKE.—Sec. Lt. Francis Herbert Thorndike, R.F.C., was the son of Canon and Mrs. Thorndike, 75, St. George's Square, S.W. He was educated at the King's School, Rochester, and very early showed strong dramatic and musical ability, appearing as a boy in a number of London plays. In the first month of the war he joined the Westminster Dragoons, and served as a trooper in the Suez fighting of 1914, and later in Gallipoli at Suvla Bay. Invalided home, he took a commission in the Yeomanry, and last spring he transferred to the R.F.C., in which he made very rapid progress, being sent to the front as a pilot only five weeks ago.

WALKER.—Cadet Lionel Reginald Walker, R.F.C. (accidentally killed while flying near Toronto, on or about August 13th), was eldest surviving son of the Rev. Reginald and Lady Emily Walker, of Ragley, Victoria, B.C. He was 18 years of age.

Engagement.

VERNON—BOND.—The marriage arranged between Lt. James Tassie Vernon, R.F.C., son of Mr. Henry Charles Vernon and the late Mrs. Vernon, of Clifton, Bristol, and Edith Muriel Bond, daughter of Mr. and Mrs. Robert Beaumont Bond, of The Red House, Sproughton, Ipswich, will take place at All Saints' Church, Sproughton, on Wednesday, September 12th.

Marriage.

GILMORE—McCOY.—On August 26th, at High Beech Church, Lieut. Eric McCrea Gilmore, Suffolk Regt., attd. Air Board, eldest son of Mr. and Mrs. C. F. Gilmore, of Bayswater, was married to Winifred, daughter of the late Henry McCoy, of Philadelphia, U.S.A., and Mrs. S. Trevor Prince, of Sewardstonebury, by the Rev. C. H. Kempthorne.

Births.

CURTIS.—On August 15th, 1917, at the Grove, Sutton, Ipswich, the wife of Lieut. J. S. Curtis, R.F.C., of a son (still-born).

LUCAS.—On August 18th, at 34, Albert Road, Regent's Park, N.W., to Violet (née Chauncey), wife of the late Lt. A. J. Lucas, R.F.C.—a daughter.

Sir Bryan Leighton, Bt., and Lady Leighton, of Loton Park, Shrewsbury, have received news that their only surviving son, Lt. Richard Tihel Leighton, Yeomanry, attached R.F.C., is missing, his machine having been shot down in an air fight over the German lines on August 17th. The gallant officer was born in 1894, and before joining the R.F.C. had held a lieutenant's commission in the Yeomanry since October, 1914. Major J. B. T. Leighton, Scots Guards, and Squadron Commander, R.F.C., elder son of Sir Bryan and Lady Leighton, was killed while flying in France on May 7th.

* * *

Lt. Hayter, R.F.C., from Farnborough, had a narrow escape of being killed on August 25th. When flying over Plumpton Lane, about five miles from Haywards Heath, his engine suddenly stopped. He was at a height of about 15,000 ft., but he planed down, though at the finish he crashed into a hedge. Several people who saw the accident rushed to the spot and found Mr. Hayter dazed and bleeding from the mouth. He was taken to a cottage close by, where he recovered.

* * *

Lt. Gasson came down in a nose-dive on August 22nd while flying at Southall, and was badly injured. He was conveyed to Hounslow Hospital, and there are only slight hopes of his recovery.

* * *

Major A. N. Miller, D.S.C., R.F.C., is about to leave this country, Reuter's Agency learns, on a second recruiting mission to South Africa. As a result of his last visit 400 recruits were obtained, and these young South Africans have shown such promise in aeronautics that a second visit to South Africa has been decided upon. Major Miller, who will be accompanied by Lieut. Bagshaw, R.F.C., of Port Elizabeth, will take with him two aeroplanes, with which he will tour South Africa in the exercise of his duties, giving exhibitions at various centres.

Major Miller states that he is not limited as to the number of cadets he can obtain. Already over 500 South Africans are engaged in the R.F.C., and both at their work and sports they have in many cases established records. Major Miller hopes to obtain at least 1,000 cadets as a result of his second visit. He is confident of success, as during his last tour he had over 2,000 applicants, although he was only able to nominate 400. Major Miller has not yet definitely fixed the details of his programme, but he expects to be in South Africa at least six months, during which time he intends to show, both in South Africa and Rhodesia, the latest methods of flying.

The conditions for cadets involve absolute medical fitness of the R.F.C. standard and satisfactory educational test, with a minimum of the School Higher Standard.

FRANCE.

Official Communiqués.

August 20th.—Army of the Orient.—The Allied Air Services carried out important bombardments. Fifty aeroplanes dropped 147 tons of explosives in the neighbourhood of Prilep (25 miles north-east of Monastir), causing a large number of fires.

August 21st.—Our aircraft bombarded in Belgium the railway stations of Thourout, Roulers, Stadem, and Gits (north of Roulers), and in the region of Verdun the railway stations of Dun-sur-Meuse, Brieulles, Fléville, and the dump of Bantheville, where a great fire broke out.

Yesterday (August 20th) 21 German machines were brought down by our pilots in air fighting. Most of these machines are reported to have been totally destroyed. On August 19th an enemy aeroplane and captive balloon met with the same fate.

The enemy's aircraft last night bombarded our rear, and in particular a prisoners' collecting camp, where a great number of prisoners were hit.

Army of the Orient.—During the 20th our aircraft were very active. French and British aviators bombarded the quarters occupied by an enemy staff at Prilep.

August 22nd.—Last night German aeroplanes dropped bombs on the district of Gérardmer (about 20 miles east-south-east of Epinal). There were no casualties and no damage was done.

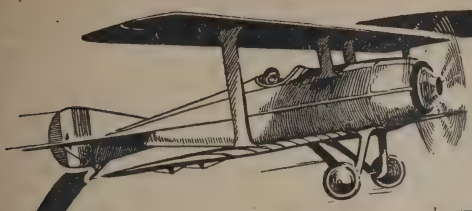
In the course of to-day (August 22nd) six German aeroplanes were destroyed in air fights and five others fell within their own lines damaged.

It is confirmed that two further German aeroplanes were brought down on the 20th by the fire of our machine-guns.

Army of the Orient.—There was great aerial activity by both sides. The Allied aviators successfully bombed the enemy camps and parks in the region of Capari (nine and a half miles west-north-west of Monastir). Three enemy machines were brought down during these operations.

August 23rd.—On August 22nd our squadrons bombarded the railway stations of Freiburg in Breisgau (east of Colmar) and the aviation grounds of Colmar and Schlettstadt (north of Colmar). In the region of Verdun 1,300 kilogrammes (about 13 tons) of projectiles were dropped on the railway stations and bivouacs and aviation grounds of the enemy. Our aircraft also attacked with machine-gun fire transports on the march.

In the region east of Altkirch our artillery caught a German kite-balloon under its fire, and it came down in flames.



Army of the Orient.—Our aircraft dropped bombs on enemy establishments at Razimbey, in the Tcherna Valley.

August 24th.—A German aeroplane was brought down this morning in the Caurières Wood by the fire of our machine-guns. Five other enemy machines fell in their lines after fights with our pilots.

Army of the Orient.—British aircraft bombarded the enemy's establishments near Demirhissar.

August 25th.—Army of the Orient.—British aviators bombed the enemy depots north of Doiran.

August 26th.—Army of the Orient.—The day of the 25th was calm on the whole of the front. Allied aviators bombarded the environs of Demirhissar (Struma front) and enemy camps north of Lake Malik (north of Koritza).

THE COPPER FINS OF THE FORWARD PLUG

THE COPPER FINS of the FORWARD PLUG are a feature which places it in an absolutely unique position from an efficiency point of view. In the air, over-heating is a constant source of danger, and the fact that copper has a conductivity 60% greater than other metals is therefore a point of great importance.

Behind the Forward is an experience in Plug manufacture certainly unequalled, and a simple test will prove its special value.

There are two models, "S" for stationary engines (illustrated), made with long or short barrel, and "R" for rotary engines, and in both the Insulators are made of the best unbreakable India Ruby Mica, and as a result of the Plug's construction the fins can be made exceptionally thin — another feature worth consideration.

We want your inquiries—write us now.

FORWARD MOTOR Co.,
Forward Works, Summer Row,
BIRMINGHAM.

To motorists and members of the motor industry the name of Arthur Bray will be very familiar, from his long and important association with Charles Jarrott. To-day Arthur Bray is only 30; but from 1907 his has been a prominent figure in all the great Trials, Hill Climbs and Speed Records which have done so much for the development of the industry. As mechanic to the great "C.J." he rode in the St. Petersburg—Moscow Race; and when it comes to trophies of his own, this merry-faced boy can produce about twenty-five pots and medals bearing most of the famous names in the history of British motoring.

August 13th, 1914, found Lieutenant Bray in France doing his bit; and he is still doing it with all that irrepressible enthusiasm which marks the true sportsman.

H.M.S. ————

9.7.17.

My dear Brett,

Many thanks for the cylinders which arrived quite safely. I must say that I was agreeably surprised at the splendid job which you made of the repair to the cracks in the jacket. As it was impossible to obtain a new cylinder casting it meant, briefly, that without your timely aid the car would have been out of action until the end of the war. I feel certain that a novice would not have discovered that the cylinders had been cracked at all, and, knowing the difficulties experienced with welding, I can only assume that the "Barimar" process has been brought to the acme of perfection.

Wishing you every success,
Faithfully yours,
(Signed) ARTHUR BRAY,
Lieut. R.N.V.R.

BARIMAR

Scientific Welding Service

stands alone in this vital matter of metal repair. Barimar science covers every branch of the work. Barimar organisation is a triumph of method. Barimar Guarantee covers every customer, great and small.

When you send your repairs to Barimar, you engage that Scientific Repair Service which has been and is commanded by the greatest National undertakings. And yours will be the same service: prompt, courteous, incomparably efficient for workmanship, invariably moderate in charges.

Address Dept. B.C.:

BARIMAR, LTD.,

How to Send Goods.

Remove all fittings. Label plainly with your name and address. Despatch goods carriage paid, and post written instructions same day.

August 27th.—On the 25th and 26th inst. three German aeroplanes and a captive balloon were brought down, and four other machines forced to land out of control in their lines.

The aviation ground of Eix, the hutments of Foameix, the bivouacs of Grémilly and Wavrille (all near Verdun) were copiously bombarded by our squadrons

Army of the Orient.—Our aviators have bombarded Lebnitza, between Lakes Malik and Ochrida.

* * *

Mr. H. Warner Allen, writing in the "Morning Post" from the French front on August 14th, says:—

The remarkable feature of Friday's (August 10th) fighting north-west of Saint Quentin was the important offensive rôle played by aeroplanes in the French counter-attacks. The Germans had succeeded during the night in occupying, about five hundred yards of the French advanced line east of the hamlet of Fayet, but despite desperate efforts was quite unable to extend this success.

The French at once set to work to recover the lost ground. Aviators flew very low over the heads of the attacking infantry, and not only kept the gunners informed of the exact position of the troops, but also kept up an unceasing and deadly machine-gun fire on the enemy's trenches. At the moment of the counter-attacks squadrons of aeroplanes hovered over the enemy's positions like hawks, and their fire rendered invaluable aid to the infantry.

The enemy's fire riddled the machines with bullets, but could not damp the ardour of the aviators. After 36 hours' hard fighting the French recovered all the ground they had lost, inflicting severe losses on the Germans.

* * *

Mr. H. Warner Allen, writing in the "Morning Post" on August 21st of the recent fighting around Verdun, says:—

In yesterday's (August 20th) battle the kite-balloons played an important part. In the early morning the Germans sent an aviator, who is regarded as an expert in the destruction of "sausages," to attack two kite-balloons behind the French lines. He was lucky enough to get through the aeroplane patrols, but he missed both balloons. One of the observers shot industriously at the aeroplane as it approached, and then seeing that he could not stop it, threw himself over the side with his parachute. The parachute is so made that the man using it should jump from one side of the car, and in the hurry of the moment the observer jumped from the wrong side. His parachute could not open, but luckily it entangled itself with the cordage of the balloon, thus holding the observer, dangling just below the car. There he had to stay while the German aviator attacked and missed his balloon. When the balloon had been hauled down he was released.

* * *

A message from Paris, dated August 22nd, states that the Special Correspondent of the Havas Agency before Verdun sends the following telegram:—

A fresh crime without any possible excuse has to be added to the record of German Kultur. Yesterday, no doubt, infuriated by their defeats before Verdun, the Germans scientifically bombarded three of our hospitals several times. Towards 10 o'clock in the evening several German aeroplanes flew at a height of less than 200 metres in the district behind Verdun over the clearance hospital No. 6 and another hospital situated on each side of the road and connected by a wooden footbridge. Four incendiary bombs were dropped on the sheds, in which all the beds were occupied by wounded men. Three sheds immediately started blazing, while the medical staff, with admirable courage and devotion, endeavoured to rescue the wounded who had not been struck by projectiles or yet reached by the flames.

The aeroplanes came back a second time, and at a still lower altitude fired with machine-guns on the rescuers. Hospital No. 6 was also struck by bombs. In order to prevent the spreading of the fire the staff hastened to destroy the footbridge joining the two hospitals. The murderous officer aviators, perceiving them, fired on them with their machine-guns. Seven of the staff were killed and about 20 wounded. In the glare of the conflagration the Geneva Red Crosses painted on the roofs of the buildings showed up most plainly in the night, but the German aviators, none the less, continued their criminal work, and came back a third time to bombard the two hospitals.

Seven wounded men were killed in their beds and a dozen others were struck by projectiles. A Red Cross nurse and a male nurse were killed by the bedsides of the wounded. At the time of this brutal outrage the bandaging wards were filled with the wounded. There was no panic, and those of the wounded who were able to get about assisted in the work of rescuing their comrades, while the entire staff made efforts to keep down the flames, which threatened altogether to destroy the wooden buildings.

It was in identical conditions that another hospital at a different point was bombed, and here, too, we have to mourn the loss of victims.

Mr. H. Warner Allen, writing of the fighting round Verdun, in the "Morning Post" on August 26th, says:—

The enemy seems to have adopted the bombardment of hospitals as a deliberate system of revenge. In the Verdun district the hospitals of Dugny, Monthairon, Vadelaincourt, and Belrupt have all been bombarded either by guns or aeroplanes. Dugny hospital was attacked on July 14th, July 22nd, and August 3rd. Between August 10th and 18th it was bombarded every day with the exception of the 15th. On the 18th the bombardment was particularly violent. Trenches had been dug round the hospital buildings to afford some shelter against the enemy's projectiles. The chief nurse, Mlle. de Baye, looked after her wounded in the hospital without shelter. She had given her helmet to one of her nurses. A shell burst, killing three women nurses and seriously wounding five, including Mlle. de Baye.

On August 20th an aeroplane attack on the hospital of Vadelaincourt caused 18 deaths and wounded 50 persons. The same night one wounded man was killed by an aeroplane bomb at the Château of Petit Monthairon, used as a hospital, and ten were killed at Belrupt Ambulance. In all, 43 nurses, male and female, and patients have been killed and 55 injured in this region by these treacherous attacks. The Germans are acting deliberately. On an aviator brought down at Mort Homme a photograph was found showing Vadelaincourt hospital with the Red Cross on its roofs plainly visible.

GERMANY.

Official Communiqués.

August 21st.—Twenty-six enemy aviators were shot down. We lost five aeroplanes.

Front of German Crown Prince.—The first day of the battle before Verdun had the same result for the French. The aviators materially assisted in the satisfactory termination of the day.

August 22nd.—During the past few days Lieut. Voss gained his 36th and 37th aerial victory, and Acting-Officer Vice-Sergeant Müller his 25th and 26th.

The bomb attacks of our aviators against fortified towns on the English coast to-day were successful.

August 23rd.—During the aerial attack on the English coast the military establishments at Margate, Ramsgate, and Dover were successfully bombarded. During numerous aerial engagements the enemy lost three aeroplanes. Two of ours have not returned.

August 24th.—On August 23rd (? 21st) one of our airships, while attacking British naval forces, was shot down west of the Jutland coast north of the Horns Reef.—(Signed) Chief of the Admiralty Staff.

In the course of the enemy air attack on the night of August 21st a girl was killed at Metz. No military damage was done at Ensisheim, Freiburg, and Schlettstadt, but a woman and five children were injured.

August 27th.—Baron von Richthofen has shot down his 59th opponent.

* * *

According to a Berlin telegram, a complementary official report respecting the raid by naval airships on the Yorkshire coast on August 22nd gives the following details:—

On approaching the British coast, bombs were lavishly dropped on enemy outpost vessels. The naval forces and land batteries fired briskly at our airships, which replied with well-directed volleys upon Spurn Head battery.

Towards two o'clock in the morning large quantities of explosives were dropped on Hull and good incendiary and destructive effects were observed. The airships also dropped bombs on Lincoln, with observed good effect.

Bombs were dropped on the southern bank of the Humber, near East Grimsby, on brightly illuminated factories and sheds, which were well hit. The collapsing of buildings and the extinguishing of lights showed the effect.

On their return our airships again were fruitlessly fired at from land and sea, and were able to drop their last bombs with good effect on the naval forces which were firing at them.

[It is officially stated that none of His Majesty's ships was damaged.]

* * *

An inspired German report received at Geneva on August 25th from the Friedrichshafen Zeppelin factory states that the recent airship raid on the British coast was entirely intended for observation purposes, and was quite successful.

It is added that the Zeppelin commanders succeeded in ascertaining the strength and position of important British naval forces.

RUSSIA.

Official Communiqués.

August 21st.—Baltic Sea.—On August 19th several squadrons of enemy seaplanes carried out three flights over the coast of the Island of Oesel. In the Gulf of Riga our aviators, meeting the enemy, forced him to retire. An enemy aviator dropped bombs on the town of Arensburg (north of the Gulf of Riga).

Our aviators carried out a flight over the Courland coastline, where they dropped bombs on the enemy military establishments.

The "Guardian Angel" Parachutes

THE GUARDIAN ANGEL PARACHUTES
TRADE MARK
(REGISTERED)

THE WAR IS A WAR OF ENGINEERS.
THE "GUARDIAN ANGEL" PARACHUTE IS THE CONTRIBUTION OF AN ENGINEER.

The engineering principle carried out in the design of this Parachute and its Launching Disc is static and kinetic control of all functions of its component parts, in order to obtain absolute reliability of their action under all conditions. The "Guardian Angel" Parachute is, in fact, A MACHINE, with its parts so designed that they can act only in ordered sequence and in predetermined paths, AND IN NO OTHER WAY.

As it leaves its Disc it encloses a wide column of air which is compressed by the weight of the Airman into a bun-shaped cushion of air, thus instantly and automatically expanding the body of the Parachute to its utmost extension. Its packed tapes issues in CONTINUOUS TENSION AFFORDING SUPPORT TO THE AIRMAN, and making entanglement a mechanical impossibility. It opens because it MUST. It cannot DO ANYTHING ELSE. Except to the extent of the length of the shock-absorber sling THERE IS NO FREE-FALL.

RELIABILITY—First. RELIABILITY—Second. RELIABILITY—All the Time.

E. R. CALTHROP'S AERIAL PATENTS, LTD.

ELDON STREET HOUSE, ELDON STREET, LONDON, E.C.2.

Telephones (2 lines): London Wall 3266 and 3267. Telegraphic Address: "Savemalivo-Ave-London."

August 23rd.—On the Riga coast one of our aeroplanes brought down a German seaplane, which fell into the sea.

August 25th.—To the south of Smorgon our artillery brought down a German aeroplane, which fell in our territory.

August 26th.—Our aviators dropped bombs on several points in the enemy's lines.

August 27th.—On the Danube, on the evening of August 25th, our machine-gun fire brought down an enemy seaplane, which caught fire in the air and fell in enemy territory.

AUSTRIA.

Official Communiqué.

August 26th.—Aerial activity has been exceedingly lively. Assisted by British and French, the Italians are everywhere numerically superior. This superiority is outbalanced by the bold offensive spirit of our fliers. From the 18th to the 23rd 12 enemy machines were shot down, six of them by the chasing squadron of Captain Bromovski, who has disabled already 18 adversaries. During the above-mentioned time we lost one aeroplane.

ITALY.

Official Communiqués.

August 21st.—Two hundred and sixty-one of our aeroplanes have flown on the battlefield. Troops massed between Selo and Comen and on the eastern slopes of Mt. Hermada (all of the Southern Carso) were bombarded; the works at the Tarvis (Carnia, about nine miles north of Tolmino) railway centre and enemy troops in movement there were bombed with five tons of high explosives. One of our chasing machines did not return to its base. One enemy aeroplane was brought down.

Albania.—On August 20th an enemy aeroplane was hit by rifle fire and forced to land within its own lines.

August 22nd.—Masters of the air over the battlefield, our aeroplanes have bombarded troops and hutments in the Chiapovano Valley (12 miles north-east of Gorizia) and along the eastern slopes of Mt. Hermada (Carso), making the enemy suffer losses and causing conflagrations in his communication lines.

August 23rd.—Operations on Julian Front.—The arm of the air also yesterday co-operated in the success. Our aeroplanes and airships have bombarded the enemy, dropping over 12 tons of bombs.

August 24th.—The battle is continuing. On high our aviators, with untiring élan, and giving the enemy no truce, have bombarded his massed troops and carried destruction into his communication lines by dropping 15 tons of bombs.

August 25th.—Aerial activity was very lively yesterday. Our Capronis, after having several times bombed Chiapovano Valley (north-east of Gorizia), crowded with enemy troops, flew low and engaged the infantry. Of the 233 aeroplanes which took part in the battle one only did not return.

August 27th.—Our aeroplanes, by effective and repeated bombardments, sowed destruction in the interior of the enemy lines, increasing the disorder which reigned there on account of the hurried retreat.

* * *

Semi-Official.

August 21st.—During August 19th, co-operating with the advance of the Army, floating batteries of the Italian Royal Navy and British and Italian monitors effectively bombarded the enemy positions and communications on the Lower Isonzo. At nightfall they were attacked fruitlessly by hostile aeroplanes. Enemy seaplane K.212 was brought down by our anti-aircraft guns and captured in the Grado Lagoon (mouth of the Isonzo).

* * *

From the "Morning Post" of August 28th:—

Reuter's Agency has received the following additional details of the fighting on the Italian front from Italian Headquarters:—

An Austrian communiqué of the 25th announces that between 18th-23rd 12 Italian machines were brought down. This figure is absolutely fantastic. The Italian aerial losses in this period of time amount to two machines which have fallen in the enemy lines and two others which were obliged to land outside their proper field, but within the Italian lines. This positive fact, which has been proved, shows what value may be attributed to the Italian losses which the Austrians attribute to them in their communiqué.

* * *

A correspondent of the "Giornale D'Italia," writing of the recent fighting around Korite, says:—

Our aerial fleet is far superior to that of the enemy. A document found on an aviator who had been brought down admitted that the Austrian aeroplanes numbered only one-third of those of the Italians. The feats of our aviators prevented the enemy seeing behind our lines, at the same time throwing into disorder the enemy's rear. At the beginning of the battle our aviators co-operated with the artillery by locating the enemy's first lines and reinforcements and directing its fire. The enemy's losses are extremely heavy, and the number of prisoners is continually increasing.

One of the Stefani communiqués—they have been very frequent of late about aerial things—relates details of the hostile visitation of Venice on the 14th inst., and the reprisal raid of the Italian Naval A.S. on Austrian coast bases and torpedo-boats.

At least four of the enemy's machines were brought down. The crew of one, K.228, are dead, and from another of the raiders brought down on the sea by torpedo-boat fire, a colonel and a major of the Austro-Hungarian Army were made prisoners.

In spite of the repeated mishaps to which the Austrian bomb-droppers are so prone, it is not true that hospitals here are now to be armoured with steel cupolas, nor is it a fact that serious evil-doing is now rewarded by sentences of so many years V.A.D. work.

The poor somewhat naturally show a certain preference for undergoing medical treatment in their own homes.

The United Front has now a United Back as far as this country is concerned. I refer to the home training schools. Almost linguistic academics.—T. S. H.

* * *

A report from Milan states that Capt. Giulio Laureati has broken the world's out-and-home record by flying from Turin to Naples and back without descending. Capt. Laureati, who piloted a new model S.I.A., with a Fiat motor, left Turin at 10.7 a.m., on August 26th, arrived at Naples at 2.30 p.m., and, after circling over that city, returned to Turin, where he arrived at 8.40 p.m.

The distance between Turin and Naples is said to be 460 miles. 10 hrs. 33 mins. for 920 miles is good going.

BELGIUM.

Official Communiqués.

August 21st.—Our aviators, favoured by the weather, have made very many flights. It is confirmed that two enemy aeroplanes have been brought down, one on August 16th at Gheluvelt, and the other on the 18th near Tervaete.

Both yesterday and to-day there has been great activity on the part of German aviators. About 250 flights have been made on each day.

August 26th.—During the past week our aviators have been particularly active. They engaged in several encounters, in which four enemy aeroplanes were brought down near our trenches, and opened machine-gun fire on various occasions against the enemy organisations in the region of Dixmude and Rille, flying over them at a low altitude.

August 27th.—In a period of less than 24 hours Second Lieut. Thieffry was engaged in four aerial engagements, one of which terminated to his advantage, the enemy machine attacked by him having fallen in flames to the north-east of Mannekensvere. This makes the ninth machine brought down by this officer.

HOLLAND.

A message from The Hague on August 25th states that an official communication by the Ministry of Foreign Affairs states that the Dutch Government has protested to Berlin against the flying over Dutch territory on August 8th by a squadron of German aeroplanes and the dropping of bombs without military necessity.

The German Government, through its Minister there, has expressed its regret. It states that the German squadron in the English Channel lost its bearings owing to thick clouds, and leaving the clouds found itself over Dutch territory, so that, owing to a strong south-westerly wind, it inevitably had to fly over the province of Zeeland.

The Dutch Government charged its Minister in Berlin to inform the German Government that the latter's explanation of the facts did not justify the flying over the province of Zeeland, nor the flight over the provinces of Friesland and Groningen by two aeroplanes, of which one descended near Blyham, and the second was shot down near Beetra.

At the same time the Dutch Ministers in London, Le Havre, and Paris were charged to ask the Governments to which they were accredited if the aeroplanes of their air fleets, by participation in an air fight over the island of Schouwen, were culpable of the violation of Dutch territory and the dropping of bombs. In the meantime the military authorities are making an examination of portions of bombs.

* * *

A message from Amsterdam states that bombs have again been dropped on Dutch territory. On August 25th some fell near the village of Cadzand and others this morning near the village of Aardenburg. Only very slight damage was caused.

* * *

A German one-seater aeroplane landed on August 23rd near Elburg, on the Zuyder Zee, in the province of Gelderland. The pilot, an officer, has been interned and the machine seized.

SWEDEN.

The well-known Swedish aviator, Captain Dahlbeck, has made proposals for a seaplane service for passengers and mails between Stockholm and Abo, Finland. The journey by land now takes three days and three nights; by a seaplane service it will take but a few hours.

Defies the Wildest Weather

For the extreme conditions that the Aviator is called upon to face —sudden changes of temperature at varying altitudes — slashing rain—saturating mist—blizzards —THE BURFRON offers such ample security that it leaves every other flying coat "in the cart." The fatal defect of all previous coats has been the openings in front, through which it was an easy matter for wet or cold to penetrate. THE

BURFRON

winds round the figure without leaving openings anywhere to admit rain or wind, and is held together securely by a button at the neck.

A belt has two advantages: (1) it snugs down the coat in cold or blusterous weather; and (2) gives it a smart Service appearance.

THE BURFRON is made in dense Burberry—woven and proofed material, and to make security doubly sure, and to maintain the warmth essential to comfort when flying, it is lined with proofed wool, or soft Camel Fleece.

Complete R.F.C. and R.N.A.S. Kits in 2 to 4 Days or Ready for Use.

R.F.C. UNIFORMS.

So much doubt exists about the uniform properly to be worn by officers of the R.F.C. and officers attached R.F.C., that it seems well to quote Dress Regulations concerning the Corps.

Army Order 378, 1913, which lays down the law on the question, begins with the following reference to the much-debated question as to whether the much-disliked R.F.C. tunic is to be worn by officers of the Army attached R.F.C. :—

ROYAL FLYING CORPS.

579A.—Officers seconded in their regiments for duty with the Royal Flying Corps wear the full dress, undress, and mess-dress of their permanent unit.

[Here is a very knotty point which should be decided once and for all. The order that attached, or seconded, officers are to wear the R.F.C. tunic was issued as what is commonly known as a "War Office Letter." One is told, by those who ought to know, that a War Office instruction of this nature cannot cancel or override an Army Order, which has the direct authority of the King. Therefore, until a new Army Order is issued on the subject it would seem that the instruction for all officers below field rank to wear the unsightly double-breasted tunic is null and void.

Naturally, one does not recommend young officers who are proud of their own regiments, and the tradition attaching to their regimental badges, to refuse to obey an order from their C.O.'s to wear the R.F.C. tunic, but one does strongly recommend senior R.F.C. officers to find out whether they are acting in accordance with King's Regulations in ordering their subordinates to discard the uniform of their permanent units.—C. G. G.]

FULL DRESS.

579B.—HEAD-DRESS.—Forage cap (universal pattern), para. 21. Blue cloth with scarlet band and welts. Badge in gilt, the letters "R.F.C." in monogram within a laurel wreath, surmounted by a crown.

579C.—TUNIC.—Blue cloth, with scarlet collar and cuffs. The collar ornamented with ⅜-in. blue braid along the top and ends and blue Russia braid at the bottom; the cuffs pointed with ⅜-in. blue braid round the top, the points of the cuffs 6 in. from the bottom of the sleeves. Eight buttons down the front and two at the waist behind. The skirts cut square in front and closed behind; ornamented with three loops of blue Russia braid embroidery on each skirt behind. The front and collar edged with scarlet cloth. Twisted, round, gold shoulder-cords lined with blue cloth and fastened with small buttons.

579D.—BUTTONS.—Gilt, almost flat, with letters "R.F.C." and crown.

579E.—COLLAR BADGES.—As for cap badge, but smaller.

579F.—GIRDLE.—Blue silk, 2½ in. wide, lined with black morocco leather and fastened at the left side with three loops and three small gold embroidered olivets.

579G.—TROUSERS.—Blue cloth, with scarlet cloth stripe, 2 in. wide, down the side seams.

579H.—BOOTS.—As described in para. 16 for dismounted officers.

579I.—GREAT COAT.—Drab, of special pattern, with bone buttons, and badges of rank in worsted embroidery on the shoulder-straps.

SERVICE DRESS.

579K.—CAP.—Austrian pattern, of drab serge, with brown leather chin-strap. Badge as for forage cap, but in bronze.

579L.—JACKET.—Drab serge, of special pattern, worn with white strip linen collar. Badges of rank in worsted embroidery on the shoulder-straps. No collar badges.

579M.—BREECHES.—Bedford cord, of special pattern.

579N.—BOOTS.—Brown ankle, para. 16.

579O.—PUTTEES.—Drab, para. 40.

MESS DRESS.

579P.—MESS JACKET.—Blue cloth, scarlet cloth roll collar; pointed cuffs of scarlet cloth, 6 in. deep at the point and 2¾ in. deep behind; four small buttons and button-holes down the front. Shoulder-straps of blue cloth, 1½ in. wide at the base, tapering to about 1 in. at the points; rounded points, fastening with a small button. The shoulder-straps sewn in at the shoulder. Collar badges as on tunic.

579Q.—MESS VEST.—Blue cloth, fastened with four small buttons.

579R.—BUTTONS.—Gilt, flat, engraved with the letters "R.F.C." and a crown.

579S.—OVERALLS.—As in full dress.

579T.—BOOTS.—Wellington. Field officers, box spurs.

579U.—SPECIAL BADGE.—A "flying" badge is authorised for officers possessing certain qualifications. It is worn on the left breast above medals and decorations, in gilt for full dress, undress, and mess dress; in silk embroidery on blue cloth for service dress. For the mess dress the badge is smaller.

579V.—WORKING CLOTHING.—Of the pattern supplied for non-commissioned officers and men.

579W.—Officers of the Royal Flying Corps, Special Reserve, are required to provide only service dress, mess dress, and the necessary working clothing. The provision of full dress is at the option of the individual except when posted for continuous service.

"ALL THE WORLD'S AIRCRAFT."

The 1917 edition of "All the World's Aircraft," the companion volume to Jane's "All the World's Fighting Ships," has now been placed on the market by the publishers, Sampson Low, Marston and Co., Ltd. As the editor and compiler thereof, I suppose I had better review it myself, seeing that I cannot decently let someone else praise it in THE AEROPLANE, and I am certainly not going to let anyone else damn it in this paper.

To begin with, the publishers insist on selling the book at a guinea, though I did my best to persuade them to put the price up of 25s., seeing that everybody is charging more for everything—except authors and editors, apparently—and the partners in "All the World's Aircraft" certainly deserve a war bonus as much as anybody else. However, the net result is that purchasers of this monumental work get just twice as much for their money as they did last year, so far as quantity is concerned. I leave the buyers to judge the quality for themselves.

Naturally it has been impossible to publish photographs or figures about the more recent of the Allies' machines, especially English machines. The French and Italians are rather less secretive about their fairly recent types than are our own people. But, anyhow, in compiling the book, I was careful not to include anything which we did not already know to be known to the enemy. On this point the Naval and Military Censorship appears to have agreed with me to quite a remarkable extent, for it paid me the compliment of passing the whole work without altering or deleting a word or an illustration anywhere. For which courtesy I hereby express my thanks.

This fact, however, must not be taken as implying that the information is out of date. The book is a work of reference and not a newspaper, so it is practically as up to date as any work of reference can be, under the circumstances. At any rate, it includes among enemy machines the D.III. Albatros, the Gotha, and the Roland, and so far we have heard of few newer types.

A dictionary of aeronautical, technical and slang terms has been added this year, because so many new and important people are beginning to take an interest in flying, and will have to learn a new language before they can understand the subject. Slang words, though most reprehensible in use, must necessarily be understood by such people, hence their inclusion. For their benefit also, tables are included showing the growth of various records for speed, height, duration, and distance, step by step, since flying began. In no way can one appreciate so well the progress flying made in the six brief years before the war.

The aeroplane section of the book is introduced by a long and very able article on "War Flying" by Captain W. E. de B. Whittaker, the King's Regiment, whose knowledgable writing was a prominent feature in THE AEROPLANE before the war. During the war, Captain Whittaker has seen a great deal of active service, and has himself flown discomfortably over enemy fire, so that he writes with experience to guide him. The airship section, which is, of necessity, chiefly historical, is largely composed of an article by Mr. W. L. Wade, who has studied the history of airships to good purpose. The aero-engine section has a lengthy preface by Mr. de Holden-Stone, written so as to be understanded of the people.

The historical section has been largely expanded, in accordance with the desires of reviewers of earlier editions, and I was so fortunate as to obtain from the Countess of Drogheda permission to use in the prefatory notes those excellent historical notes on war balloons and parachutes which that talented lady herself wrote for the catalogue of her Aeronautical History Exhibition. So far as I can gather no such brief and comprehensive history of these two precursory branches of modern aeronautics have ever been published, and I wish here to express once more my indebtedness to Lady Drogheda for her permission to use her work.

It is my desire to make the work under discussion a kind of aeronautical encyclopœdia, so I shall be greatly obliged to any readers of this paper who may also read "All the World's Aircraft," if they will in due course write and give me any suggestions which may occur to them for the improvement of future editions.—C. G. G.

["All the World's Aircraft" can be obtained, price 22s., post free, from the William Dawson Publishing Co., Ltd., 2, Bream's Buildings, E.C.4.]

THE WORLD'S AIR ROUTES.

Those who heard the excellent lecture given recently on The World's Air Routes by Colonel the Lord Montagu of Beaulieu, C.S.I., F.R. Met. Soc., A.I.M.E., will doubtless appreciate the highly educative effect that lecture would have had if it could have been heard by many thousands of people. Consequently one is glad to learn that it can now be bought in pamphlet form.

Nearly all the lantern slides shown at the lecture, which were of the highest interest, have been incorporated in the book, which is very well printed by Eyre and Spottiswoode. It is published by the Car Publishing Co., of Regent House, Kingsway, W.C., at the low price of 6d., or 8d. post free. One hopes that many readers of this paper will avail themselves of this opportunity of educating their friends in the possibilities of aerial transport.

THE INVASIONS OF ENGLAND.

An inquest on six victims of the recent raid was held on August 23rd, at the hospital at Ramsgate. Walter Spain, one of the deceased, was just about to commence a new job at the harbour when the raid took place.

A man named Coomber was about 30 ft. under the road in a storehouse. It was explained that he must have felt the full force of the rush of air following the explosion. A witness said that three of the men who were lying inside the storehouse were almost unrecognisable.

The Chief Inspector of Police said that nearly 30 bombs were dropped by the raiders. They appeared greatly worried by our gunners, whose shooting was splendid.

The Deputy Mayor said the raid served no military purpose, and did not assist the German campaign. It was difficult to believe that in these days of civilisation and Christianity such things could be done, and he hoped God would forgive the authors, for our people never could.

[It would seem sufficiently obvious that the military objective was the harbour and stores to which reference was made in evidence.—Ed.]

* * *

The Press Bureau announced on August 23rd that the total number of casualties in the aeroplane raid on Ramsgate and Dover on the previous day was :—

Killed	11
Injured	26

* * *

A correspondent of the "Daily Telegraph," writing on August 22nd, says :—

The raiding Zeppelin reported by Lord French as having attacked the mouth of the Humber appeared over one locality about half-past twelve, and was given a very hot reception. It was a beautifully clear night, and the raider was flying at a great height. It was nevertheless caught in the rays of the searchlights, and for a time was clearly visible to those below, and formed a distinct though distant target for the anti-aircraft gunners.

British aeroplanes were in pursuit, but the sky becoming overcast, and the raider having dodged the electric rays, made good his escape. For nearly an hour the Zeppelin was confined to a particular area, thanks to the activity of our defences, but its great altitude spoiled them of their prey. Several bombs were dropped, but for the most part they fell in open country, doing very little damage.

* * *

At 7 a.m. on August 27th the funeral took place at Margate of the three German aviators who were brought down in a burning Gotha aeroplane last week. The bodies, which were badly charred and which had been lying at the farm on which the machine fell, were conveyed to the grave on a gun-carriage. Officers and men of the Royal Naval Air Service attended, and the military provided an escort and a firing party. The burial service of the Church of England was read by a military chaplain, and afterwards three volleys were fired and the Last Post sounded. There were no name plates on the coffins

* * *

At an inquest at Ramsgate the jury recommended the provision of public bomb shelters was urgently necessary, and that the cost should be met by the Government. The Deputy-Major, in expressing the town's sympathy with the parents, said that he had called a council meeting for this week to consider the suggestion. He thought that ultimately the cost should fall on the Government, but human lives were in the balance, and expense must not be allowed to affect their decision.

AIRCRAFT IN THE HOUSE.

On August 21st **Major Baird (Parliamentary Secretary to the Air Board)**, in reply to **Colonel Burn** (U., Torquay), said generous contributions to the cost of the provision of aircraft had been received from all parts of the Empire, and from British subjects in neutral and Allied countries. The total number of gift aeroplanes or seaplanes so provided since the beginning of the war was 437. These gifts were much appreciated by His Majesty's Government and by the two Air Services as evidence of public interest in their work.

CONGRATULATIONS.

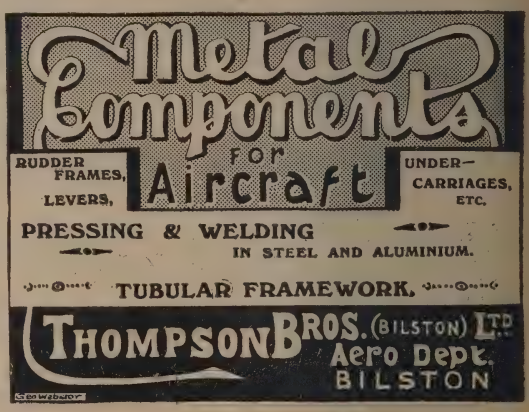
MARTIN.—On August 21st, at Lingwood, St. George's Hills, Weybridge, the wife of Helmuth Paul Martin, of a daughter.

SPENCER'S SPORTS.

On Saturday, August 18th, the male employees of Messrs. C. G. Spencer and Sons, Ltd., the balloon manufacturers and aeronautical engineers, of Highbury, Clapton and Hackney, held their annual outing, brakes conveying them to the Old Rye House. On arrival, they immediately proceeded to do justice to a very good dinner, provided by the host, Mr. Ernest Allen, managing director of the company.

Mr. Allen congratulated the rigging staff on the good work they had done during the war, and suggested that, despite what unfair critics might say, each man had the consolation that he was doing something for his country in the present critical moment, and it was very possible that the important work of aircraft construction was as essential to victory as an army in the field.

He informed the employees that the firm had a very large number of important contracts in hand, and trusted that the very high quality of workmanship would be maintained, and the output would continue to increase, and that any demands made upon them by the Government would always receive the very greatest attention, from the heads of the firm down to the youngest member of the staff.



The following were the results of the ensuing sports :—

Tug-of-War.—Manor Works beat Highbury Grove.

75 Yards Race for Veterans.—1, Preskett (Manor Works); 2, Gates (Highbury Grove); 3, Hiscox (Manor Works); consolation, Bean (Manor Works).

75 Yards Race for Men—31 to 55.—1, Linfoot (Manor Works); 2, Rose (Manor Works); 3, Archer (Manor Works).

200 Yards Race for Men under 30.—1, Sheppard (Manor Works); 2, Durrant (Highbury Grove); 3, Allgood (Highbury Grove).

ON PROGRAMMES AND PRODUCTION.

In order to place quantity production on a practical basis it is necessary to have a programme, whether it be for a Service or a mere commercial purpose. For instance, in the case of the Flying Services it is necessary to lay down a regular scheme for the production of certain machines and engines during a certain period. Knowing approximately—only a rough approximation, one fears—how many of each can be produced in a given time, and the factories available for their production, the programme has to set forth the types and numbers of each type to be made during the period covered by the programme, and the factories in which each type is to be reproduced.

Now it is fairly obvious that any departure during the allotted period from the programme laid down must result in upsetting the arrangements made for quantity production in the various factories. Washing out one type and substituting another must cause delay in deliveries. Alterations in detail design, alterations in specifications of material, or the substitution of one engine for another must also cause delay. To secure maximum output it is necessary to lay down a programme and stick to it rigidly.

On the other hand, if the programme covers too long a period, it will mean that the machines produced towards the end of that period will be already out of date when delivered, owing to the rapid improvements which are constantly being made in design. And the more rigidly designs are standardised the more pronounced will be the contrast between the performances of the last machines of one programme and the first machines of the next. If slight modifications are permitted in machines of the same type in the same programme, then probably the last deliveries will be better than the first, and will approximate fairly closely to the first batch of the next programme.

Rigid versus Elastic Programmes.

To take a case in point, the original F.E.2b—now obsolete—had a third pilot-wheel to the under-carriage and the necessary struts and bracing to carry it. Also it had a 120-h.p. Beardmore engine. Supposing that it had belonged to a rigidly fixed programme which could not be modified, it would have continued as such to the end of that programme without modification. It was, in fact, modified and improved by substituting a 160-h.p. Beardmore and simplifying the under-carriage by abolishing the third wheel and all its tackle—which modifications did not necessitate any material alteration in the standardised parts of the machine, and so did not hold up deliveries.

In those distant days I do not suppose that anybody had ever heard of programmes, but the instance will serve to demonstrate the difference between a rigid and an elastic programme, so far as detail design and easily made modifications are concerned. In this instance the modification and improvement became possible because the 160 Beardmore came into being after the F.E.2b had been standardised with the 120. In other words, the output programme of the Beardmore works happened to overlap and not to coincide with the F.E.2b programme of the Royal Aircraft Factory, though probably the arrangements for output were not officially called programmes.

For all I know, the F.E.2b may have been designed for a prospective 160 Beardmore, or another engine altogether, but what actually did happen will serve to illustrate the point as concerns rigid versus elastic programmes.

Impossible Synchronisation.

There is another point in connection with fixed programmes which deserves consideration. A certain number of firms which have shown in the past their ability to produce original designs of definite value, and others which can show cause why permission should be given to them, are permitted to build experimental machines. Now, in a perfectly ordered and organised world, all those experimental machines would be ready for official test on a certain date, and the pick of them would then be selected for inclusion and standardisation in the next official programme.

Unfortunately, it is much more likely that slight errors in design or construction, or even defects in a propeller or an engine, for which the design of the machine is not to blame, may prevent the best machine of the lot from doing its best performance before the new programme is fixed, and so it must necessarily be left out of that programme. And then, just when all the sources of production are in full blast on the new programme, that slightly delayed machine may come along and put up a performance which puts the programme machines utterly in the shade.

Yet if that machine is promptly substituted in the programme for those just adopted, it is going to hold up deliveries of the quite good machines already in process of manufacture, and is going to keep the pilots at the front on the obsolescent machines of the previous programme.

If I am not altogether misinformed, something very like such a position exists at the moment in two well-known firms. In each case the firm is busily at work on officially designed machines which have quite decent performances—albeit they might be produced much more quickly if redesigned in detail. In each case the firm itself has produced a machine which performs very much better than the official type, and is said to be very much simpler and quicker to make.

But if those firms were permitted to side-track the work they are now doing, and to start in to make their own machines, it would cause a transition period during which their deliveries would drop badly. And even

when their own machines began to come through in quantities they would be non-standard, and would upset any programme laid down for the allotment of new machines to certain squadrons at the front and the equipment of those squadrons with the necessary spare parts for the machines allocated to them.

A Difficult Problem.

It is evidently a difficult problem to decide how best to deal with machines or engines which just miss one programme and are too early for the next. Refusing to use them at all means depriving the people at the front of machines which are obviously better than anything they are likely to have for a long time. Using them means delaying standardised machines.

One solution would be to turn them over to be made by the Royal Aircraft Factory, under the supervision of their original designer. Upsetting of commercial standardisation and of plans for quantity production would not affect the R.A.F., which exists primarily as an experimental establishment, and for the production of spares. These machines might be turned out there by the dozen instead of by the hundred, and used by self-contained detached squadrons, so that their equipment of spares would not worry aircraft parks and depôts at the front. Thus the machines would do good work, and experience gained in using them might lead to improvements which would make them worth including in the next programme. If, before the new programme came along, some other designer had beaten them badly, that would be merely the fortune of war and commerce, and they would be washed out along with the old programme. At any rate, the machines would have fulfilled a useful purpose, which would be much better than holding them up entirely till the next programme was being fixed.

Overlapping Programmes.

Naturally all these problems are affected by the length of time covered by each programme. For instance, a programme covering a whole year would be obviously absurd, for improvements, and even great discoveries, follow one another so rapidly that by the end of a year everything with which a programme started would be hopelessly out of date, despite modifications in design such as have been indicated earlier in these notes. One has only to look at any year-old design to see the truth of the statement. The fact that we are using in quantities designs which are two and even three years old is a national misfortune, not a disproof of the argument. The shorter the programme the more quickly can new or radically altered designs be put into use. And yet the programme must be long enough to permit of organisation for quantity production on a big scale, otherwise constant chopping and changing from one programme to another would be as bad as having no programme at all. I will not venture to lay down a proper length for a programme, but it certainly does seem fairly evident that no one type of machine can last out more than six months on active service and still be considered up to date.

One is inclined to wonder, therefore, whether it would not be possible to institute a system of overlapping programmes. The Aircraft Industry might be cut up into definite sections, each with its own allotted programme, so that by the time the programme for one section was about half-way through another programme for another section would be just starting deliveries. The Aircraft Industry is now such a huge affair, and is growing so rapidly, that each such section might easily be bigger in a few months' time than the whole Industry was a few months ago. Under such a system each section would begin its programme two or three months after the preceding section, and so there would be a constant supply of the newest and most up-to-date machines such as Sir Douglas Haig demanded some nine months ago as a necessity for the maintenance of the mastery in the air.

Objections and Answers.

If is true that the overlapping of programmes in this way would mean that there would be many different types in use at the front at the same time, but that could hardly matter, so long as each section of the Industry was told off to supply certain R.F.C. brigades and so long as the aircraft parks of those brigades were supplied with the necessary spares by that particular section of the Industry. It would mean that certain brigades would at certain moments be better mounted than others, but each in turn would have new supplies from its own new programme. Which, after all, would be better than keeping a few veteran squadrons on obsolete machines and sending out new and inexperienced pilots on the newest and very best types which they were incapable of handling to the best advantage. There are doubtless plenty of other objections and difficulties in the way, but at any rate there may be the germ of an improved system in the suggestion, which I offer in all humility.

That Confounded Pendulum.

There must be some way out of the chief trouble connected with fixed programmes, namely that while machines from a new programme are just being put into service the R.F.C. will be better mounted than the enemy, and that while the tail end of the programme is being delivered the enemy will be in the ascendant. It is all very well to talk airily about "the swing of the pendulum," as politicians do when they want to excuse a series of heavy losses due to the superior equipment of the enemy from time to time. The real task of the Air Board, and especially of its technical department, is to get that confounded pendulum up to our end of its swing and keep it there.

ON SOME LESSONS FROM THE ENEMY.

One way of defeating an enemy is to profit by the lessons he teaches. The German has always been singularly clever in learning lessons of this kind. For years before the war he defeated us by taking our new ideas, adapting their design for quantity production, organising his factories for big and rapid output, and then flooding the markets of the world with goods which we originated but could not produce at his price.

In war he has been not less willing to learn, even if he has been less successful in the result of his lessons in some ways. In other ways he has been highly successful, and has improved on our originals. For instance, he distinctly cribbed his Fokker monoplanes from the Morane, his scout biplanes from the Sopwith and Bristol designs, and his two-seaters from the Avro. Whence he stole his Gothas I do not profess to know, but certainly our multiple-engined Shorts were long before any German effort with multiple engines, and the Dyott twin-engined machine, designed in 1914, built in spite of official disinclination in 1915, and flown successfully in 1916, when the design was well over a year old, was as near as no matter exactly according to the best modern practice, albeit hopelessly underpowered, again thanks to official disbelief at the time.

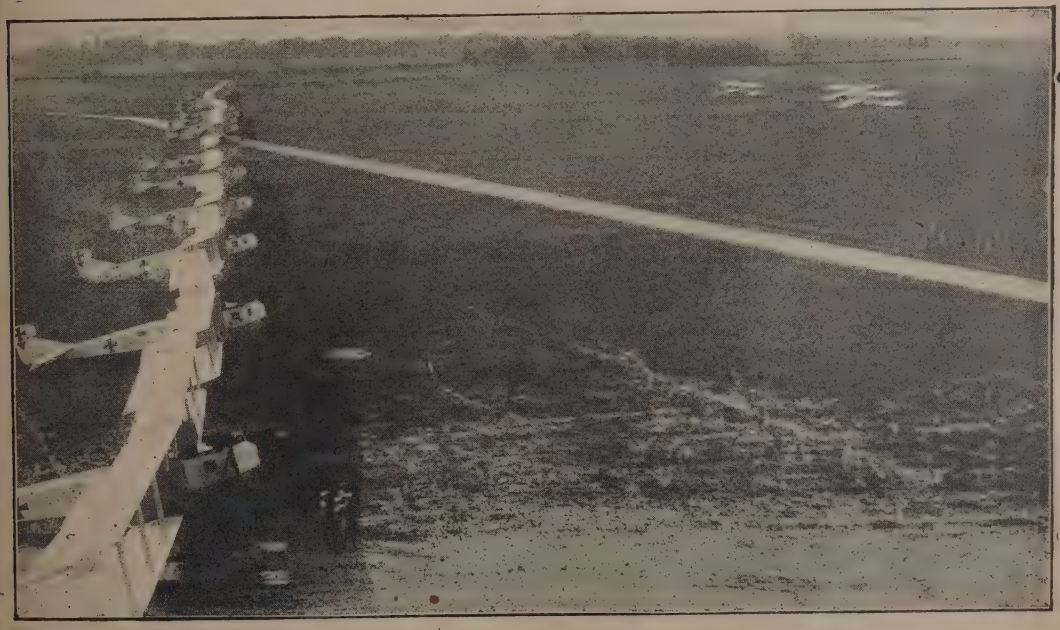
Wherever the German has improved on our originals it has been in performance and not in workmanship or detail design, and he has always had the advantage of having magnificent engines, whereas—again thanks to previous obtuseness—we are only just beginning to have engines. Thanks to his engines, he has been able to put up very fine performances, and in the success of those performances he has learned other things which seem worth studying.

The Spread of Education.

There are heaps of points to "crab" about German machines, but it would be a very silly thing to do it in print, for one does not want to help the Hun to improve his machines by the light of our criticism—"our" being that of such officers and men of the Flying Services and people in the Aircraft Industry as have had the rare privilege of inspecting captured German aeroplanes. The word rare is used, not because captures are rare, but because, contrary to French custom, few are privileged to penetrate to the Holy of Holies in which our official experts stow away the prizes which they acquire by the prowess of the mere fighting man. It is curious how much trouble and expense is incurred in educating young officers in technical aeronautics before they learn to fly, and how carelessly the expansion of their technical knowledge at the expense of the enemy is treated afterwards: or, perhaps one should say, has been.

It would be well if one could point out all the bad things in German aeroplanes, just to show our own designers what to avoid, but it would be better still if one could describe all their good points, so as to help to improve our designs.

In a general way the commonest reproach against German machines is rough interior finish. As a matter of fact, that is really a good point, so long as it is not so rough as to increase weight. Sand-papering and polishing internal woodwork and cleaning up internal or external metal-work cannot possibly save any weight worth mentioning, so presumably the time so spent is wasted, because it might be used in producing something useful.



Breakage in the Air.

There is, however, a terrible amount of shockingly bad work in German machines—according to our ideas of what is good. Nevertheless, they seem to hang together somehow, and it is doubtful whether the number of German machines which break in the air is greater in proportion than the number of ours which do likewise.

In this connection there is, however, one very important point to note. In most types of ours which break, the breakage seems to be traceable to extreme lightness, which lightness is due to our endeavours to procure with relatively low-powered engines the same performance which the Germans procure by simply cramming in more power. One gathers from contemporary German technical publications that our light construction horrifies the German at least as much as his rough and ready construction horrifies us.

When one tries to get a better climb with an 80-h.p. Rhône than the Hun gets with a 160-h.p. Mercédès something has to be cut down to permit it. Similarly when one uses a problematic 120-h.p. R.A.F. on a two-seater to do that for which the Hun uses a 200-h.p. or a 260-h.p. Mércèdes or Benz on an Albatros or D.F.W. one must not be surprised at wing-spars collapsing if, to reduce weight and head resistance, only a single pair of struts is used. The German having so much more power at his disposal has less excuse for breakage, so when his machine breaks he must be blamed for bad work or bad material or bad design, and cannot put in the necessities of war as an excuse.

Naturally we are to blame for using feeble engines, but that is entirely the fault of those officials who discouraged British engine design before the war, and standardised too soon on bad engines, which only became reasonably reliable after they had already become out of date. However, we are improving.

THE ENEMY'S BEST.—A Squadron of Gothas on a German Aerodrome. About 15 machines appear on the left, about nine more head on in the far background, and three more in the open.

Examples Worth Following.

Where the German really scores is in his common sense in over-all design. A look at any modern German tractor biplane convinces anyone whose eye for general effect is not blinded by a maze of figures that the German "walfisch," or whale, shape is obviously right.

Take the little D.III type Albatros chaser, or the Albatros two-seater, or the D.F.W.-Aviatik, and one may see that from the front of the propeller-pot to the tip of the tail the whole thing looks right. The pot fades away into the engine-housing. The engine-housing fades off into the rounded top and bottom and the somewhat flatter sides of the fuselage. The fuselage likewise fades off into the tail and fin. And the whole affair gives one the impression that it is one single job and not a patchwork of afterthoughts like all our officially designed machines and some of our trade designs.

All the curves blend together, or sweep from one to the other harmoniously, like Wagnerian music in which everything means something and yet all is a perfect whole, whereas some of our stuff, the B.E. and R.E. series in particular, is like American ragtime with bits of airs put together anyhow, with jarring edges sticking out all over it. It is simply imperfect mathematics *versus* art all over again. Our officials seem to forget that the ultimately perfect mechanism is always supremely eyeable. We do not know enough about the science of aeronautics to rely upon our mathematics yet, and that is why the machine built largely by eye always beats the machine built entirely by figures.

Power Preservation.

Notice another thing. The wily Hun does not put his air-screw flat up against a great radiator, or a huge cowl, so that the propeller tips have to do all the work while the major portion does nothing except waste power in turning round. He carries his propeller out on a long nose to the engine, so that the point at which the natural line of the fuselage runs into it is only a few inches from the centre. Thus the propeller-pot is quite small and all the part of the blade which is worth using is used. The line of the fuselage slopes back so gently that the slip from the inner portion of the propeller blade is not thrown violently outwards, but has a fair lead along the fuselage.

In some machines the tops of the cylinders stick out above the top of the fuselage, but even so they are well away from the propeller, and anyhow, being so narrow, they do not put up as much resistance as would a cowl close up to the propeller. In other machines even the little projecting cylinder-heads are covered with a special streamlined cowl of their own.

German Propeller Design.

So far as one can judge from photographs, the Germans seem to have learned a good deal about propeller design, for the part of their propellers immediately emerging from the pot seems to have a very peculiar shape, as if it were intended to have some particular effect of its own in relation to the air streams over the pot and the nose of the fuselage. Anyhow, it has a hump on it which is not in the least like the inner sections of our pseudo-scientifically designed four-bladers.

Moreover, it may be noticed that although the German engines are more powerful than ours the Germans never use a four-bladed propeller. They seem to be able to mop up all their huge power with two short blades, and to do it efficiently, whereas we use four blades, do not get any better results, take at least twice as much labour and time to make the propellers, and use at least eight times as much precious timber in making them. The German is not a fool where the combination of manufacturing and science is concerned, whatever else he may be in other ways, and I do not think he uses two-bladers of those funny shapes just for fun or even for economy, so I take it that he knows what he is at.

German Scientific Ways.

Before the war, certain of our own designers who have since made good in practice, and so have made one inclined to trust their theory, used to think very highly of a certain haunt of Hun highbrows known as the University of Göttingen. One may reasonably suppose that the aeronautical laboratory and testing and experimental plant at Göttingen has improved during the war, seeing that the Germans rely so much on practical science in all their manufacturing work and are not satisfied with mere scientific fireworks, or gasworks, as we have always been.

Therefore one might reasonably suppose that the University of Göttingen is, proportionately to the size of the German Aircraft Industry, as far ahead of our official stipendiary geniuses to-day as it was before the war. Which, when one considers the relative sizes of the German and the British Aircraft Industries, may mean quite a long way ahead, seeing that the Germans have to turn out enough machines to hold their own against the united products of Great Britain, France, America, Russia, and part of Italy, the rest of Italy about balancing Austria's output.

Anyhow, even if the increase has not been in such proportion, a good many of us would back Göttingen for sense and science combined against the National Physical Laboratory and Company, judging purely by results. So it may be just as well, when one is permitted the privilege of inspecting a German aeroplane, to try to puzzle out why the Hun designs certain things in certain ways, instead of merely scoffing at the obviously bad workmanship, as appears to be the custom of some of our people.

Fabric.

Another matter on which we might perchance learn something from the Hun concerns fabric. I am told that the wing covering of the modern German machines resembles sacking rather than aero-fabric as we understand it. One's obvious inclination is to argue from this that Germany is short of flax or short of spinning machinery or short of weaving machinery or short of spinners and weavers. Which, of course, would be very consoling, just as the great Mr. Belloc's calculations about the shortage of German man-power were consoling, till it began to appear that the prophesied shortage did not come to pass.

Therefore it is better to look for another reason for the sacking. I suggest that it may be used on purpose, in preference to the kind of stuff we use.

In the first place, it would appear to be a good deal cheaper to make. Which means that it costs less in time and labour. Fewer hands can produce more of it, with less wear and tear of machinery and less expenditure of fuel, lubricants and other things which are precious in a belligerent country.

In the second place it may be preferable in other ways. It would appear to be a good deal stronger, for example. Our intelligent technicians lay down a law that fabric must not weigh more than so many ounces per square yard. They insist on all sorts of interesting tests for bursting strains, tensile strains, and so forth:

. The .

all of which may be fulfilled by a very fine fabric, whereas probably what matters most in fabric on war machines is its resistance to pure tearing stress, which is quite different from tensile or bursting stresses.

Tearing Strength.

Doubtless you know that old trick of tearing a number of cards at once. If you keep them all together they cannot be torn, because you try to shear the whole lot at once. But if you slide them skilfully into the position of a flight of steps, so to speak, they can be torn quite easily, because you tear the first and then the second and then the third and so on, so that the progress of the tear, or shear, in each card is always one step ahead of that in the card next to it. Well, the real strength of fabric is something like that.

If the stress comes on the whole lot together, either as a bursting stress from the air, or as a tensile pull from the working of the wing structure, the strength may be more than sufficient. But if a hole is made in the wing by a shell splinter so that a tear is started and a piece is left flapping in the wind, the pull may come entirely on one thread, and then on the next, and then on the next, so that one after another the threads break and the whole wing covering rips off.

Now suppose that in two sorts of fabric an equal number of linen threads per square inch were woven together, so that the weight per square inch (or per square yard) was exactly the same, only in one case each three consecutive threads were twisted into a kind of rope, whereas in the other they were laid side by side, then obviously the first kind would be a coarse open fabric and the other would be a fine close fabric. On a straight pull they would presumably be of equal —or nearly equal—strength, because in a band, say, a foot wide there would be an equal number of threads in tension. But if one tried an edgewise tear in the coarse fabric, instead of having to break one thread only, to start the tear, one would have to break three at a time, and so on for each successive thread, so presumably that fabric would be three times as hard to tear as the finer kind.

One has heard so much of fatal, and nearly fatal, accidents lately through fabric tearing off the wings of high-speed machines that the question of using a fabric which is coarser but more resistant to tearing may be worth considering. There is, naturally, the objection of its greater porosity, but it is not clear why this should be an objection, seeing that greater porosity would make it easier for the dope to penetrate. And if dope as at present constituted is not suitable, then it may be possible to alter the dope to suit. Perhaps coarser fabric might permit of using a thicker dope which could be applied more quickly and in fewer coats.

Fabric Possibilities.

So far, everyone seems to have been hunting for finer and lighter fabric, and as people have a habit of thinking like sheep, especially in new sciences or industries where nobody really knows anything for certain, perhaps it may be worth somebody's while to turn round and start thinking the other way altogether. Perhaps the Germans know a lot more than we do about it after all. Remember, they have command of the whole Belgian flax supply, so they cannot well be short of material. Also, there may be other fabrics altogether preferable to flax, if somebody had the gumption to get out of the rut and go and look for them. We only took to linen because it was the obviously next thing to cotton, when we found that cotton was damaged by dope. The Irish linen trade was thus forced to take an interest in aviation, and so evolved what was wanted for the time being. But the textile industry as a whole has not taken an interest in the game, so we do not yet know what improvement on cotton or linen could be evolved if some experienced textile man really tried.

At the present moment I happen to be watching developments concerning some quite interesting substitutes for linen fabric, which, if they pan out all right, will come in at something like half the present price, and will be right outside the control of the people who appear to have mixed up so successfully the prices and supplies of linen fabric.

And, after all, perhaps all fabric covering for wings is entirely wrong. Probably they ought to be made on an entirely different principle.

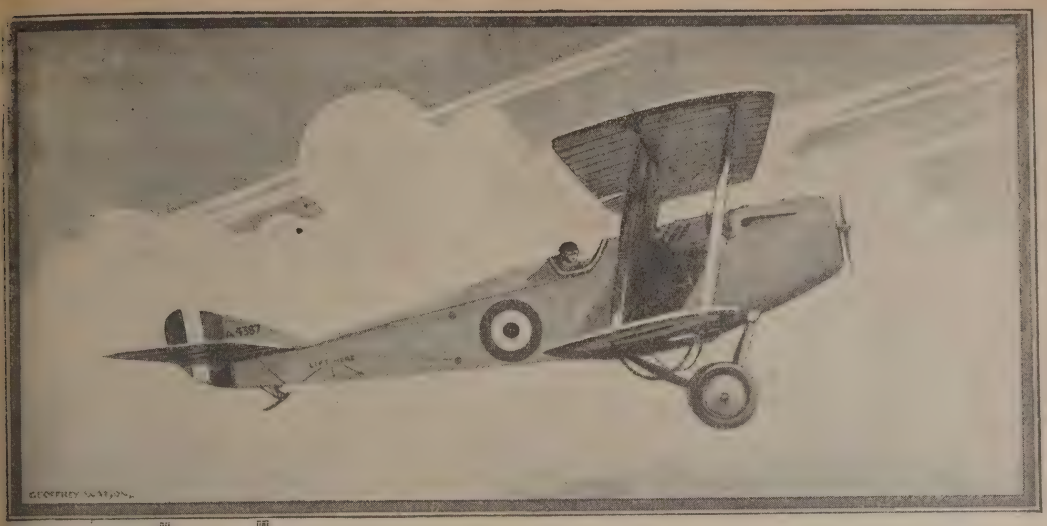
Fuselage Making.

Perhaps the most important departure the Germans have made from all other countries in aeroplane design is their consistent use of ply-wood for fuselage covering. The first person to realise the possibilities of ply-wood was the inimitable M. Béchéreau, of the Deperdussin Company. The little racing Dep of the 1913 Gordon-Bennett race, the first machine to cover 120 miles in an hour, was a true *monocoque,* or single hull, machine with a fuselage built entirely of layers of thin wood cemented in strips onto one another, and built up on a mould the shape of the fuselage, an expensive but most effective method of construction.

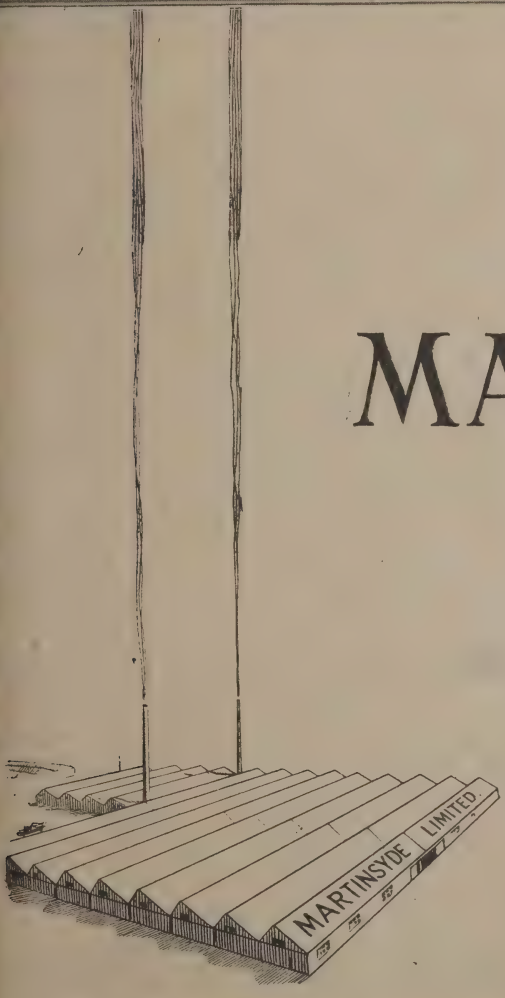
The system was adopted and improved by Mr. Koolhoven, in those extraordinarily enduring machines which he built for the British Deperdussin Company with Lieut. John Porte, R.N., in 1913.

No other firm took to the principle, on account of the expense probably, till well on in the war the Germans started using ordinary three-ply wood and bending it over a frame made up of ribs and stringers like the hull of a ship, attaching it thereto with nails. This is not as neat a job as the Deperdussin way, but it certainly seems better than the ordinary longeron, cross-strut, wire-bracing, and fabric method.

Wrong and Right Fuselage.



If one longeron is shot through, probably the whole fuselage crumples up. If a longeron is cracked in a bad landing, it is not seen, and the whole tail probably falls off the next time the pilot tries to spin. Fabric covering may get shot about and be torn by the wind, so that it wraps itself round the controls. A bullet may cut a couple of bracing wires and let the whole fuselage twist out of controllable shape.



On the other hand, with the three-ply monocoque any fracture which can do any harm is at once visible outside. It can be shot as full of holes as a sieve without being any the worse for it. It cannot tear under any circumstances. Over half its circumference would have to be shot away by a shell before it could break across, and more than three-quarters might be shot away in a series of small holes without having any serious effect. If badly shot about, it can be repaired quite easily from the inside, or patched with fabric on the outside. It is stiffer than any possible longeron and wire fuselage.

In fact, everything is in favour of the three-ply monocoque, and nothing is against it except its cost and its weight, both of which could be reduced if its manufacture were tackled as a commercial proposition on a quantity production basis. Probably it could be made cheaper than the longeron type if tackled as a kind of McGruer Spar problem.

A Pioneer Type.

Probably by now most people have forgotten that experimental Bleriot monoplane produced in the first few months of war, which ought to have been the pioneer of all quantity production types, and perhaps still may

MARTINSYDE

WOKING, Surrey.

be. The forepart, as far back as the passenger's seat, was all of metal, a kind of bath of bullet-proof steel in which sat the engine, tanks, and crew. Bolted onto the back of that was a three-ply truncated cone, for the barrel of the fuselage, and on the chopped-off end of it was bolted the tail, fin, elevator, and rudder, as a complete unit.

The bullet-proof bath spoiled it, on account of the weight, but the general idea of building up fuselages in three separate units, with a three-ply monocoque centre section, was perfectly sound. I wonder who will have the enterprise to start on something of the sort as a standardised, quantity production, programme job.

Thank the Hun.

Anyhow, let us thank the Hun for a good many useful lessons of late. He has taught us how to use and run multiple-engined bombing squadrons. Several young and ardent R.N.A.S. officers knew as much and more about it a year or two ago, only it needed the Hun to convince our authorities as usual.

He has taught us how to use and run "circus" squadrons, although "all star" fighting squadrons were quite a favourite notion with some of my young friends in the R.F.C. long enough before anyone ever heard of Immelmann or Bölcke or von Richthofen.

He has taught us the uses of big high-powered engines, though every aero-engine designer, except the official experts who were trying to make the 90-h.p. R.A.F., knew a year before the war that they would be wanted.

He has taught us quite a lot of other things which quite a lot of people in this country who were not official experts knew long enough before the Hun knew them, though they could not use their knowledge because they were not officially approved.

For example, there is nothing new in all this stuff about streamlines, and propellers, and fabric, and three-ply, and monocoques, and so forth. It is all as old as the war, and older, to plenty of people in the Aircraft Industry. Only the Hun has done it, or used it, or made it, and has got it all working successfully to his own advantage, and we have not.

And in these days so many of our leading Service and official experts are young gentlemen who have never heard of Lilienthal, and Chanute, and Phillips, and Weiss, and Etrich, and other people who have really done things, that it is well worth while to dig up ancient history once in a while under the guise of discussing novelties. So thanks to the Hun for affording the opportunity. I hope we may profit by it.

C. G. G.

CAPTURED MACHINES.

From the "Daily Express":—

The official "Norddeutsche Allgemeine Zeitung" prints the following list of British aeroplanes which, as alleged, fell into German hands during the month of July. The names and numbers are as they appear in the German text:—

47 Sopwiths.—One-seaters.—No. 7493: Lt. Fitzherbert, 55 Sqdn., dead. Motor Clerget, 9B 2674: occupant burned. No. A.6240: Capt. Hudson, a prisoner. No. 6332: Lt. Grosset, a prisoner. No. unknown: Lt. Steldon. No. B.2779: Lt. Wordmann, wounded. No. B.3806: Capt.-Lt. Voight, dead. No. unknown: Lt. Shepherd, dead. No. 3528: Lt. Tapp, wounded. No. unknown: Lt. Whyte, a prisoner. No. A.6216: Sec. Lt. James B. Hine, a prisoner. No. unknown: Lt. Smith, dead. No. unknown: Lt. Ellis Breid, dead No. 3823: N.C.O. Hume, a prisoner. No. B.3531: occupant dead. In five Sopwith one-seaters the names of occupants and numbers could not be identified.

Two-seaters.—No. A.3: occupants unknown. No. 2133/7484: occupants taken prisoners. No. unknown: Pilot unidentifiable; Observer Sgt. Eric Fletcher, both burned. No. unknown: Lt. G. G. Mathew, a prisoner; Lt. E. D. Sliter, wounded. No. A.7490/6547: Sec. Lt. V. C. Coombs Taylor, Sec. Lt. Harold Montagu, both wounded. No. S.8/1665: Lt. George Gordon, Capt. MacLennan, both dead. No. R.2576: Capt. G. H. Cook, Lt. Moore, both prisoners. No. A.1020: Sgt. W. S. Wikham, Lt. H. N. Curtis, both dead. In six Sopwith two-seaters neither the numbers nor names of the occupants could be ascertained.

Triplanes.—One-seaters:—No. 5435 Lt. Hillabi, dead. No. 6309: Lt. Millward, dead. No. 5480. Lt. Ramsay, dead. No. 6291: Lt. Eyre, dead. Motor Clerget No. 1658: Lt. Ramsay, dead. No. 6304: Lt. Kent, a prisoner. No. C.A.5368: Lt. C. R. Pegler, dead. Motor Clerget, No. R.1236: J. C. May, dead. No. 5452: Lt. George Valentin Austen, wounded. No. N.5492: occupant, dead. In three triplanes neither the numbers nor the names of the occupants could be ascertained.

12 Nieuports.—One-seaters:—No. 3764: Lt. A. R. Adam, dead. No. 3544: occupant unknown. No. B.3483: occupants unknown. No. 3358/6783: Lt. Davis Godfrey, 40 Sqdn., a prisoner. No. B.1678: J. R. Campbell, dead. No. B.1575: Sec. Lt. G. A. H. Perques, 60 Sqdn., wounded. No. B.1694: Lt. F. W. Rook, 40 Sqdn., dead. Motor le Rhône: Sec. Lt. W. A. Bond, dead. In four Nieuport one-seaters neither the numbers nor names of the occupants could be ascertained.

5 B.E.—One-seaters:—Motor Beardmore, No. 838: Lt. C. M. de Rochie, dead.

Two-seaters.—No. 22329: both occupants dead. No. A.7109: both occupants dead. No. 23858: both occupants dead. No. A.7448: pilot dead, observer wounded.

5 de Haviland Scouts.—No. A.7449: Sgt. Walkers, N.C.O. Harris, prisoners. No unknown: Sec. Lt. A. P. Matheson, both occupants dead. In three de H. Scouts neither the numbers nor the names of the occupants could be identified.

4 Spad.—One-seaters:—No. A.6633: Lt. Douglas Weld, 19 Sqdn., a prisoner. No. S.1541: Capt. Jean Lamon, wounded. In two Spads neither the names of occupants nor the numbers could be identified.

3 Martinsyde.—One-seaters:—No. 1572: Sec. Lt. G. H. Palmer, 27 Sqdn., a prisoner. Motor Clerget, No. 2795: occupant burned. No. A.3986: Capt. H. B. Wilkins, wounded.

3 F.E.—One-seater:—No. 4937: Capt. MacGown, 25 Sqdn., wounded.

Two-seaters.—No. unknown: Lt. Grafters, Machine-Gunner Bachhouse, 20 Sqdn., both dead. Motor Rolls-Royce, No. 2275/5: Lt. Charles Hayers Balden, Lt. William Harog Watt, 20 Sqdn., wounded.

2 S.E.—One-seaters:—Motor Wolseley, No. 700/2233: occupant burned. Motor Wolseley, No. D.8355: occupant dead.

1 Rumpf D.D.—The names of occupants and number could not be identified.

1 Aeroplane.—No. 5523: Occupant dead.

A MATTER OF DISCIPLINE.

At the Westminster court-martial on August 28th, Lt. Henry Rogers South, R.F.C., pleaded guilty to conduct to the prejudice of good order and discipline in that he at Kensington on May 8th borrowed £30 from Sec. Air Mech. Duller, R.F.C., a private soldier in the unit in which he was serving.

Lord Cheylesmore, the president, read the summary of evidence, in which Duller stated that at the accused's request he gave him a cheque for £30. Accused gave him an I.O.U., and the money had not yet been repaid.

Major Stoner said he had always found accused a gentleman whose character was all that could be desired. He had had a motor-cycle accident which had affected his health and nervous system.

On accused's behalf it was said he was worried about financial affairs over which he had no control. In his desperation he went to this man. He had rendered good service at Farnborough.

The Court's decision will be promulgated in due course.

ESCAPED PRISONERS.

The German aviators, Lt. Orbum von Scholtz and Lt. Josef Flink, who escaped a few days ago from the Holyport Prisoners' Camp, Maidenhead, were recaptured at Beckenham, on August 28th.

INVASIONS OF ENGLAND.

The Local Government Board is asking local authorities to provide temporary shelters for persons rendered homeless by air raids. Hammersmith Council has already arranged for the use of premises in cases of emergency.

A QUESTION OF PRIORITY.

A mechanic employed by a firm engaged on the construction of standard ships applied to the London Munitions Tribunals on August 31st for a leaving certificate. He said he wanted to obtain employment under the Aid Board, which he considered was work of greater national importance.

The Chairman: But standard ships are of great importance to us.

Applicant: Yes, but airships will be more important still.

The application was refused.

THE DURATION OF THE WAR.

BY ROGER BAYONS.

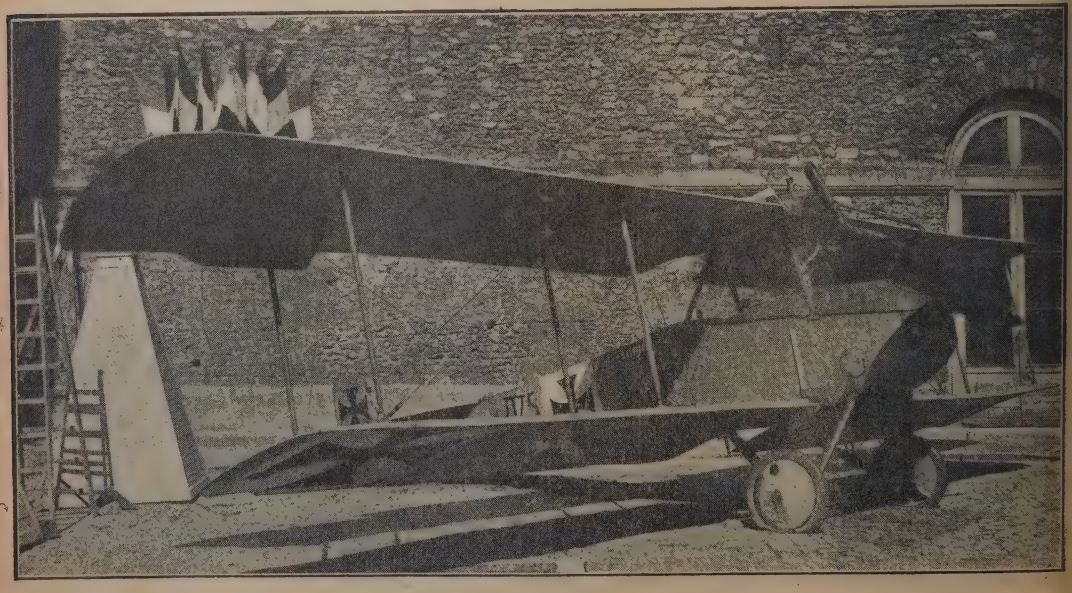
(The first article of this series appeared on March 3rd, 1915, and the second and third on December 13th and 20th, 1916, respectively.)

Since the last articles of this series appeared in these pages the conditions of the war have changed considerably in many ways. In December last the territories of Roumania, with the exception of an insignificant portion in the south-east, had fallen into German hands. The British and French progress on the Western front had stopped for the winter months. The United States of America, directed by a statesman of singular ability and foresight, was still negotiating with the Central Empires in the hope that reason would prevail in the German camp, and that the coercive diplomacy of Prussia would realise the stupidity of alienating the last powerful neutral from a friendship which, if a little one-sided, was at least a valuable relief in the general antagonism prevailing against the Kaiser and his legions.

Minor nations, such as Chili and Peru, beloved of the society poets, still held their hands awaiting an opportunity for interference which would justify their action. Nations which, by reason of their minute armies and navies, are unable to take a prominent offensive part in the war are still valuable as neutrals. They can be the homes of propaganda, and from their shores important wireless messages as to weather conditions and movements of shipping can be sent to the enemy, isolated as he is by the sea blockade. Each nation, therefore, which declares war is injuring the Germanic allies to a degree out of all proportion to the additional manpower employed.

The Enemy at a Standstill.

Another feature of the past few months has been the loss of the power of taking the offensive on the part of the Central Empires. In December last, though the enemy was stationary, or even in a process of gradual retreat, the initiative had not been lost on other fronts. In Russia, success on occasion followed the Emperor's eagles, in Roumania the enemy was uniformly victorious, and on the Italian front he was in an impregnable position.

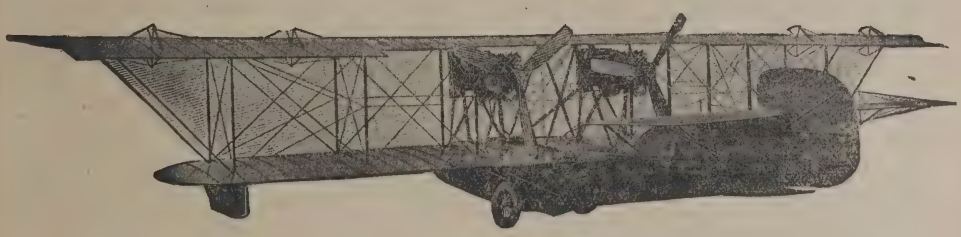


To-day no light illumines the sky of his military future, save that he may attain an advantage of unknown dimensions in Russia. On all other fronts he is slowly but surely being ousted from those positions which he has spent so much blood and money to obtain and maintain.

At sea he is denied any hope of such victory as would alter his fortunes in the war. He is inflicting heavy damage on the shipping of the Allies, but the damage is not irreparable, and the loss of cargoes involved causes no more than an unpleasant shortage in the countries concerned. Great Britain cannot be starved into submission by such means as are at present in use by the Germans, nor can her Allies suffer seriously.

In the air he is steadily losing any title to supremacy. The machines of the Allies are improving, and the supplies are increasing at rates which the Central Empires cannot hope to rival. The Germans are able to make air raids on England which are in a manner effective in that damage is inflicted and that the public are disturbed from their attitude of detachment from the troubles of war. But in no way can such limited success bring him nearer a decisive victory in Flanders, and every aeroplane he detaches for raiding purposes reduces his aerial strength in the principal arena of the war. In consequence, his troops must fight in blindness against a foe whose eyes are day by day becoming keener and of greater penetration.

British Pugnacity.



The great ones of his flying services have gone, and there is none to take their place. The unnamed British pilots who fly as a matter of daily routine are attaining a degree of success which at one time in the history of the present war would have given them a personal fame in all nations of the world. Hostile formations of aircraft advancing in all the majesty of numbers are ei

A Modern L.V.G. Biplane, captured by the French. The curious cut-away ailerons are noteworthy.

gaged without hesitation by small parties of British aviators in such a manner as to deny the enemy the objective at which they aim, even though in the effort the epitaph of our pilots is contained in the words ". . . machines did not return."

Infantry are attacked from a height of a hundred feet when marching in the fancied security of that mysterious region "behind the lines." Columns of supply are daily thrown into hopeless confusion as they endeavour to carry out the routine of essential duty.

Enemy aerodromes on which live the pilots whose duty it is to harass the hated British or French are raided by our pilots in such manner as seriously to reduce the daily happiness of the enemy flying personnel. Nothing is sacred from the attacks of the Allied squadrons save those enemy towns which are happily situated at distances too great from our lines for successful flight.

Unity Is Strength.

But all this does not mean that the Germans are beaten. These varied disadvantages merely indicate that with unity of purpose and a continuity of effort the Entente Powers will be able ultimately to impress their will upon the enemy. Disunion or vacillation would give immediate and complete victory to the enemy, and it is only these two common failings of the Anglo-Saxon race on which he is placing his hopes.

The entry of the United States of America into the war cannot but be a serious blow to the Germanic Empires. It cannot bring about an immediate change in the present state of affairs. That country was less prepared even than was Great Britain in August, 1914, and time is necessary before the full weight of American intervention can be felt in Europe. But a limit is placed on the time in which it might be possible for the Central Empires to achieve either a victory in the field or in diplomacy. All their efforts must be thrown into the next few months. Next year will be too late. Therefore we and our Allies must see that no possibility of military or political advantage is left to the enemy in the immediate future.

Not only will the United States provide us with a vast increase in man-power, in matériel, and in food, but her entry into the war will effectually cut off all supplies from the American Continent to Germany.

Two things dominate the present state of the war—man-power and matériel. If it be granted that all other things be equal, and that in military genius the Central Empires are not greatly superior to ourselves and our Allies, an overwhelming surplus in trained men and in the munitions of war with which they fight is a certain guarantee of ultimate success.

The Advantage of Preparedness.

The Central Empires must at last be suffering from a great shortage of personnel. In earlier days his losses were more than counterbalanced by the losses of the Allies, for the enemy possessed a vastly greater number of men trained or partly trained than did the Entente Powers. Germany and her Allies had a greater percentage of returnable casualties than her enemies, and her people from earliest childhood are and have been for generations nurtured in the rudimentary principles of the art of war. The nation as a whole understood its duties during a period of hostilities. Mobilisation was carried through in entire orderliness, and such of the manhood of the land as were not in the striking force began intensive training that when their time of warlike service came they would not be found wanting.

There was no need in Germany to devise a "Service Army." The cadres were already in existence and could be expanded with the ease and simplicity of a well-designed machine. And the expansion of her armies has increased almost continuously up to the present time.

But the conditions have changed. The Central Empires have no new sources of personnel save the later classes of young boys whose days of service would not normally be due for another two or even three years. And these classes are all a little war-worn. Under the present conditions of war the entire populace suffers from its rigours to an appreciable degree, and in the Germanic Empires the people must have lost that vivid enthusiasm for combat which is proper to all healthy races.

On the other hand, her enemies have vast resources of fresh personnel. The United States, Portugal, and some of those minor States whose names have a magic charm, and are their only recommendation, all provide new drafts of men not yet disillusioned as to the horrors and difficulties of war. In sheer ignorance, if for no better reason, they will fight with vigour and address. Whatever their losses or whatever their success, they will at least kill Germans, which is an essential part of the present war.

(To be continued.)

A WORD OF ADVICE.

A reader of The Aeroplane has received the following letter from a friend on the eve of his appearance before the Selection Committee, which interviews candidates for commissions in the R.N.A.S. He suggests that the reproduction of the advice contained therein may be of assistance to other youths about to undergo a similar ordeal:—

Dearest Old Thing,

On the eve of the supreme and awful crisis of your life, a few words of advice from an old friend and true may find a genuine welcome. I therefore take the liberty, sir, of setting forth the following points, which should, in my humble opinion, prove of some use to one in your predicament.

(1.) The Board will in all probability consist of oldish men, who may have seen as much of the world and its contents as you have yourself. Treat them not as verdant babes. They will not like it or you, if you do, and if they do not like you, you will not get through. Which would be a pity considering your special ability with all kinds of machinery.

(2.) Do not show any signs of fear. They might argue that a man who was afraid of a Board would be terrified at the sight of an aeroplane, a machine in the construction of which boards play such an important part.

On the other hand, do not treat the Board with complete indifference, nor yet smile at them in a kind yet pitying way when answering their questions, after the manner of a rural divine telling the children of his parish the date of the Sunday School treat.

Your attitude should be one of fearless determination, yet paying the Board that reverence which is due to men who have seen service.

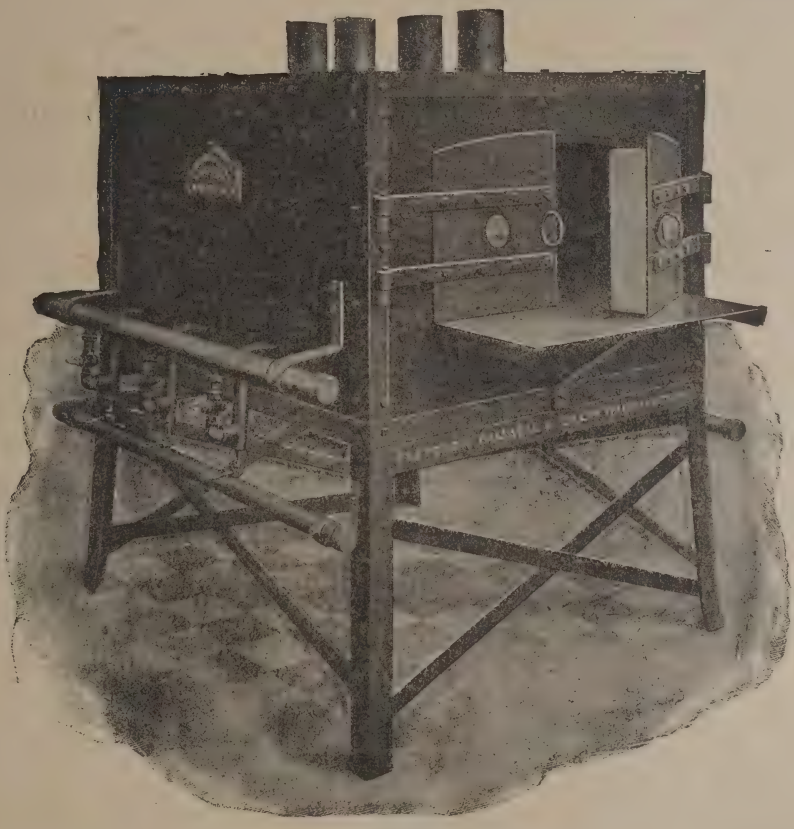
(3.) Wear your black and white striped tie, unless you can get another which looks more like a "colours" tie. But I do not think you can.

When they ask of your prowess at games, enlarge with pardonable pride upon your boating, and look meaningly upon your tie. But make it quite clear that your day-boy colours are quite different to the tie you wear. No direct deception, you understand, is necessary.

(4.) I offer this piece of advice in all seriousness and sincerity. Have your hair cut just a little shorter than usual, especially at the back. Get it well brushed, without too much grease. Its appearance should be "well-groomed" rather than "well-oiled."

(5.) Carry gloves and a stick, and, I think, wear your straw-hat with the school band. You look much better in this than in a cap, either "school" or "blood." I do not remember seeing you in any other kind, so that I cannot advise fully upon this point.

(6.) Go to bed early the night before so that you do not go before the Board with black eyes; this makes you look very wreckish.



(7.) Finally, try to hit off the clean-limbed, etc., public-school boy rather than the wealthy and gay under-grad.

Yours, etc.

FROM THE "LONDON GAZETTE."

ADMIRALTY, August 26th.

AUGUST 30th.—R.N.A.S.—Temp. Act. Flt. Lt. Alfred W. Jones, D.S.C., specially promoted to temp. Flt. Lt. for meritorious service in the field, August 28th, 1917.

WAR OFFICE, August 28th.

REGULAR FORCES.—GENERAL STAFF.—ATTACHED TO HEADQUARTER UNITS.—Brigade Comdr.—Capt. (temp. Lt.-Col.) C. G. Hoare, Indian Cavalry, from a Wing Comdr., and to be temp. Brig.-Gen. whilst so empld., Aug. 1st, 1917.

ESTABLISHMENTS.—R.F.C.—MIL. WING.—Staff Officers, 1st Cl. (Graded as an A.A.G.).—Capt. (temp. Lt.-Col.) D. L. Allen, R. Ir. Fus., from a Wing Comdr., and to retain his temp. rank whilst so empld., Aug. 1st. 2nd Cl. (Graded as a Brig. Maj.).—Temp. Sec. Lt. (temp. Maj.) J. Rubie, D. Gds., from a spec. appt. (graded as a Park Comdr.), to relinquish his temp. rank and to be temp. Capt. whilst so empld., Aug. 1st. 3rd Cl. (Graded as a Staff Capt.).—Temp. Lt. J. M. Mitchell, Gen. List, from an Equipment Officer, 2nd Cl., and to be temp. Capt. whilst so employed, Aug. 1st.

Adjt.—Temp. Lt. G. H. L. Sweet, North'd Fus., from an Equipment Officer, 3rd Cl., and to be temp. Capt. (without the pay or allowances of that rank) whilst so empld., July 27th.

WAR OFFICE, August 29th.

REGULAR FORCES—ESTABLISHMENTS—R.F.C.—MIL. WING.—Flt. Comdrs.—Sec. Lt. (temp. Lt.) A. Gray, Arg. and Suth'd Highrs., T.F., from a Flying Officer, and to be temp. Capt. whilst so empld., August 7th. From Flying Officers:—Capt. G. S. Buck, Lond. R., T.F.; temp. Sec. Lt. A. I. Riley, Gen. List, and to be temp. Capt. whilst so empld., August 10th. Lt. S. T. Ravenscroft, Yeo., T.F., and to be temp. Capt. whilst so empld., August 14th.

Spec. Appt.—(Graded as an Equipment Officer, 2nd Cl.)—Temp Capt. R. F. Wills, Gen. List, from an Equipment Officer, 3rd Cl., August 10th.

SCHOOLS OF INSTRUCTION.—SCHOOLS OF AERIAL GUNNERY.—Comdt.—(Graded as a Wing Comdr.).—Capt. (temp. Maj.) R. Bell-Irving, Canadian Local Forces, from a Comdt. (graded as a Sqdn. Comdr.), and to be temp. Lt.-Col. whilst so empld., Feb. 6th.

* * *

The King has been pleased to approve of the award of a Bar to the Distinguished Service Order to the following Officer:—

Sqdn.-Comdr. Kenneth Stevens Savory, D.S.O., R.N.A.S.

In recognition of his services on the night of July 9th, 1917, when a successful attack was carried out against the Turkish-German fleet lying off Constantinople. When the "Goeben," surrounded by warships (including submarines), had been located, the attack was made from a height of 800 feet. Direct hits were obtained on the "Goeben" and on the other enemy ships near her. Big explosions took place on board them, followed by a heavy conflagration. The War Office at Constantinople was also attacked, and a direct hit obtained.

* * *

The King has been pleased to award the Distinguished Service Cross to the following Officers:—

Flt. Lt. Henry McClelland, R.N.A.S., and Lt. Percy Townley Rawlings, R.N.V.R.

In recognition of their services on the night of July 9th, 1917, when a successful attack was carried out against the Turkish-German fleet lying off Constantinople. When the "Goeben," surrounded by warships (including submarines), had been located, the attack was made from a height of 800 feet. Direct hits were obtained on the "Goeben" and on the other enemy ships near her. Big explosions took place on board them, followed by a heavy conflagration. The War Office at Constantinople was also attacked, and a direct hit obtained.

Flt. Sub-Lt. Lacy Norman Glaisby, R.N.A.S.

In recognition of his services on July 20th, 1917, during a bombing raid on Aertrycke aerodrome. He was attacked by a hostile machine whilst over the target, and fought an engagement lasting 20 minutes. Flt. Sub-Lt. Glaisby was wounded in the head, and his observer was shot through the arm shortly after the engagement began, but they succeeded in driving the enemy machine down in a vertical nose-dive.

Flt. Sub-Lt. (Act. Flt. Lt.) Alfred Williams Carter, R.N.A.S.

This officer has at all times led his patrols with great courage, skill, and pertinacity, often engaging superior numbers of hostile aircraft. On July 22nd, 1917, he engaged single-handed for half an hour five enemy scouts, which he prevented from carrying out a reconnaissance. On July 24th, 1917, with one other pilot he attacked four enemy aircraft, one of which he drove down completely out of control.

Flt. Lt. Lancelot Giberne Sieveking, R.N.A.S., and Flt. Sub-Lt. John Roy Allan, R.N.A.S.

In recognition of their services in dropping bombs on enemy railway lines and ammunition dumps on the night of July 11th-12th, 1917.

Obsr. Lt. Ronald George St. John, R.N.A.S.

In recognition of his services on July 20th, 1917, during a bombing raid on Aertrycke aerodrome. After the bombs had been dropped on the objective, his machine was attacked by an Albatros Scout, which he shot down at point-blank range. Another hostile machine then attacked, but was driven off.

* * *

The King has been pleased to award a Bar to the Distinguished Service Cross to the following Officer:—

Flt. Comdr. Thomas Frederick Le Mesurier, D.S.C., R.N.A.S.

For consistent skill and courage in leading his flight on bombing raids, particularly on July 28th, 1917.

* * *

The following awards have also been approved:—

DISTINGUISHED SERVICE MEDAL.

A.C., 2nd Gr., L. N. Saw, O.N. F16741; Act. Air Mech., 1st Gr., J. McKimmie Young, O.N. F3652; Air Mech., 1st Gr., P. J. Adkins, O.N. F2763; Air Mech. 1st Gr., F. J. George, O.N. F1997; C.P.O. Mech., 2nd Gr., J. L. Adams, O.N. F348; Ldg. Mech. B. Cromack, O.N. F9156.

* * *

The King has been pleased to award the Meritorious Service Medal to the following non-commissioned officers and man in recognition of valuable services rendered with the armies in the field during the present war:—

1859 Cpl. R. Colwill, R.F.C.
8268 1st Cl. Air Mech. J. F. Wilder, R.F.C.
2567 Sgt. H. H. Wright, R.F.C.

* * *

Awarded the Meritorious Service Medal, for valuable services rendered with the armies in the field, in Mesopotamia:—

78169 Cpl. P. Phillips, R.F.C.

* * *

The following Officer and Man have been mentioned in dispatches:—

Flt. Sub-Lt. H. B. Smith, R.N.A.S.
Air Mech., 2nd Gr., E. W. Argent, O.N. F13482.

CORRECTION.

FROM THE COURT CIRCULAR.

WINDSOR CASTLE, August 29th.

The following Officers had the honour of being received by His Majesty, when the King invested them with the Insignia of Companions of the Orders into which they have been admitted:—

THE VICTORIA CROSS, THE DISTINGUISHED SERVICE ORDER, AND THE MILITARY CROSS.

Capt. William Bishop, Canadian Cavalry, attd. R.F.C.

THE VICTORIA CROSS.—For most conspicuous bravery, determination and skill.—Captain Bishop, who had been sent out to work independently, flew first of all to an enemy aerodrome, finding no machine about, he flew on to another aerodrome about three miles south-east, which was at least 12 miles the other side of the line. Seven machines, some with their engines running, were on the ground. He attacked these from about 50 feet, and a mechanic, who was starting one of the engines, was seen to fall. One of the machines got off the ground, but at a height of 60 ft. Capt. Bishop fired 15 rounds into it at very close range, and it crashed to the ground. A second machine got off the ground, into which he fired 30 rounds at 150 yards, and it fell into a tree. Two more machines then rose from the aerodrome. One of these he engaged at the height of 1,000 feet, emptying the rest of his drum of ammunition. This machine crashed 300 yards from the aerodrome, after which Capt. Bishop emptied a whole drum into the fourth hostile machine, and then flew back to his station. Four hostile scouts were 1,000 feet above him for about a mile of his return journey, but they would not attack. His machine was very badly shot about by machine-gun fire from the ground.

THE DISTINGUISHED SERVICE ORDER AND THE MILITARY CROSS AND BAR.

Capt. Charles Campbell, R.F.C.

THE DISTINGUISHED SERVICE ORDER AND THE MILITARY CROSS.

Capt. Arthur Coningham, R.F.C.

THE DISTINGUISHED SERVICE ORDER.

Major Joseph Landon, Essex Regt. and R.F.C.

Qrmr. and Hon. Maj. Arthur Landen, North'd Fus. and R.F.C.

* * *

His Majesty then conferred decorations as follows:—

THE DISTINGUISHED SERVICE CROSS AND BAR.

Flt. Comdr. Thomas Le Mesurier, R.N.A.S.

THE DISTINGUISHED SERVICE CROSS.

Actg. Flt. Comdr. Arthur Allen, R.N.A.S.

THE MILITARY CROSS.

Capt. John Norton, General List and R.F.C.

Lt. Ernest Green, R.E. and R.F.C.

Lt. Campbell Hoy, R.F.C.

Lt. David Scott, A.C.C. and R.F.C.

Lt. Richard Trevethan, S. Lanc. Regt. and R.F.C.

Sec. Lt. William Matheson, General List and R.F.C.

NAVAL.

The following appointments have been made in the Royal Naval Air Service.

AUGUST 28th.—Lt., R.N.V.R. (temp.).—A. R. S. C. Kennedy, granted temp. comm. as Observer Lt., seny. Feb. 25th, 1916.

AUGUST 30th.—Mr. J. B. Homer entered as temp. Lt. (R.N.V.R.), to date Aug. 28th.

Temp. Lt. (R.N.V.R.) G. D. Nelson entered as temp. proby. Flt. Lt., to date Aug. 27th.

Temp. Engr. Sub-Lt. (R.N.V.R.) J. H. Taylor granted temp. comm. as Lt. (R.N.V.R.), with seny. Aug. 27th (temp. comm. as Engr. Sub-Lt. terminated).

AUGUST 31st.—Actg. Flt. Lt. (temp.).—A. W. Carter, D.S.C., specially promoted to rank of Flt. Lt. (temp.) for meritorious service in the field, seny. Aug. 28th.

Temp. comm. (R.N.V.R.) is granted, seny. as stated:—Lt.—E. A. Gordon, Aug. 30th.

Messrs. E. Barrett, B.Sc., F.C.S. (P.O.), and R. Ferguson, M.A. (L.M.), both granted temp. comms. as Lt. (R.N.V.R.), seny. Aug. 29th.

ADMIRALTY COMMUNIQUÉS.

SEPT. 1st.—A bombing raid by the R.N.A.S. was carried out last night (August 31st) on Ghistelles aerodrome (about five miles south-east of Ostend). Several direct hits were made on the sheds in the south-west corner of the aerodrome, in which vicinity a fire was started.

Bombs were also seen to explode on the adjoining Ostend-Thourout railway line.

Many tons of explosives were dropped. All machines returned safely.

SEPT. 4th.—In the course of the air raid last night the following casualties were caused to naval ratings:

Killed, 107; wounded, 86.

THE CASUALTY LIST.

Reported August 30th.

DIED OF INJURIES.—Ferrier, Prob. Flt. Officer W. F., R.N.

PREVIOUSLY REPORTED MISSING, NOW PRESUMED KILLED.—Todd, Flt. Lt. A. S., R.N.

Allaway, Flt. Sub-Lt. W., R.N.

MISSING.—Booth, Flt. Sub-Lt. H. H., R.N.

Lewis, Flt. Sub-Lt. A. D. M., R.N.

SLIGHTLY INJURED.—Alexander, Flt. Sub-Lt. P. M., R.N.

Reported Sept. 1st.

INJURED.—Amos, Flt. Sub-Lt. J. W. P., R.N.

Reported Sept. 3rd.

SLIGHTLY INJURED.—Wallis, Flt. Lt. A.A., R.N.

Lewis, Flt. Sub-Lt. A. V., R.N.

PERSONAL NOTICES.

DEATHS.

HELBERT.—Flt. Sub-Lt. Alfred Basil Helbert, R.N., who died on Aug. 29th, very suddenly, as the result of an immersion in North Sea in Oct., 1916, was the son of Lt.-Col. Herbert, S. African Forces, and Mrs. Helbert. He was 22 years of age.

LEWIS.—Flt. Sub-Lt. Frank C. Lewis, R.N., who was killed on August 21st, aged 19, was the only son of the late Frank B. Lewis and of Mrs. Lewis, of 18, Craven Hill Gardens, W. He was educated at Northdown Hill, Cliftonville, and Marlborough College (Field House). On leaving school at Christmas, 1916, he applied for a commission in the R.N.A.S., which he entered last February. He went to the front on August 9th

His squadron commander writes:—"He fell in action in an aerial battle and fought bravely to a noble end. Your son came to me just over a week ago. I took him on his first flight here to show him the country. He soon proved a brilliant pilot, and I am certain would have done awfully well. . . ."

THOMAS.—Flt. Sub-Lt. J. E. Thomas, R.N., was killed in a flying accident at Yeovil on Sept. 3rd, and a passenger, Mr. Robert Norton, was seriously injured. The machine rose successfully but, in an attempt to turn, it nose-dived from a height of 300 to 400 ft. and was wrecked. The pilot was instantly killed and the passenger was severely injured.

ENGAGEMENT.

MAXTON—CHAPMAN.—The engagement is announced of Flt. Sub-Lt. Leonard G. Maxton, R.N., only son of Mr. and Mrs. James Maxton, Belfast, and Ruby, only daughter of Mr. and Mrs. Dartford Holmes, of Huddersfield, and only granddaughter of the late Henry J. Chapman, Westgate-on-Sea, Kent.

MARRIAGE.

WALLERS—DENHAM.—On August 25th, at St. Mary Magdalene, Wandsworth Common, Flt. Sub-Lt. Frederick Harold Wallers, R.N., eldest son of Mr. and Mrs. W. F. Wallers, of Johannesburg, was married to Olive Marjorie, only daughter of Mr. and Mrs. H. W. Denham, of Wandsworth Common, S.W.

BIRTH.

McBAIN.—On August 30th, at "Glenhaven," Taplow-on-Thames, the wife of Flt. Sub-Lt. G. B. S. McBain, R.N.A.S., of a son.

Boys are required for training as wireless telegraphists in the Royal Naval Air Service. Entry for three months' probation, and after for period of hostilities; 50 per cent. allowed transfer to permanent service. Candidates must be between the age of 17 years and 17 years and six months, and prepared to carry out flying duties in any type of aircraft at home or abroad. Pay 1s. per day and all found to age of 18, then pay of men's ratings. Apply in writing, stating exact date of birth, to N. 4 Section, Room 493a, Hotel Cecil, Strand, London, W.C.2.

Unskilled men between 18 and 45, medically classified B1 and below, are wanted for the Royal Naval Air Service for entry as aircraftmen, 2nd class, at 1s. 3d. a day; Naval separation allowance. Apply Admiralty Recruiting Department, Great Scotland Yard, W.1, or any Naval Recruiting Office or Employment Exchange. Men serving in the Army are not eligible.

MILITARY.

G.H.Q. COMMUNIQUÉS.

AUGUST 28th, 9.10 p.m.—In spite of the rain and strong wind, our aeroplanes maintained contact with our infantry throughout yesterday's operations north-east of Ypres, and successfully engaged the enemy's troops and transport with machine-gun fire.

All our machines returned.

SEPT. 1st, 9.25 p.m.—Yesterday evening the weather cleared for two hours, and for the first time for four days normal aerial activity was resumed. In air fighting one German machine was brought down in our lines, and another was driven down out of control.

One of our aeroplanes is missing.

SEPT. 2nd, 8.53 p.m.—Little flying was possible yesterday owing to rain and high wind, but during the previous night bombing operations were carried out actively by our aeroplanes against hostile aerodromes and railway stations. In air fighting one German machine was brought down.

Two of our machines are missing.

SEPT. 3rd, 8.57 p.m.—Last night our aeroplanes dropped over three tons of bombs on the enemy's aerodromes, with good results.

In air fighting one German machine was brought down and one driven down out of control.

One of our aeroplanes is missing.

* * *

WAR OFFICE COMMUNIQUÉ.

AUGUST 31st.—The G.O.C. the British Forces in Macedonia reports:—

Our aeroplanes have raided Dutli, Demirhissar and Stojakovo.

AUGUST 31st.—The G.O.C. the British Forces in Palestine reports:—

On August 28th and 29th our aeroplanes, flying at a low altitude, carried out successful operations in the Maan district (south-east of Beersheba). Eight direct hits were observed on the engine sheds at Maan, where noticeable damage was caused to a field artillery battery and to other hostile troops.

All our aeroplanes returned safely.

* * *

HOME COMMAND COMMUNIQUÉS.

SEPT. 2nd, 11.50 p.m.—Hostile aeroplanes crossed the East Kent coast at about 11.15 to-night, and flew seawards a few minutes later.

A few bombs were dropped.

There is no detailed information as regards casualties, but they are believed to be small.

SEPT. 3rd, 10.20 a.m.—Last night's raid was carried out by only one enemy aeroplane, which bombed Dover at a few minutes after 11 p.m.

Seven bombs were dropped.

One man was killed and four women and two children slightly injured.

SEPT. 3rd, 11.45 p.m.—Enemy's aeroplanes crossed the South East Coast at about 11 p.m. and dropped bombs at various places.

No reports of casualties or damage have been received as yet.

A number of our machines went up in pursuit.

SEPT. 4th.—Last night's raid was carried out by about six enemy aeroplanes, which proceeded up the south bank of the Thames Estuary as far as Chatham. Bombs were dropped in the Isle of Thanet and in Sheerness-Chatham area, between 10.40 and 11.30.

There were no Army casualties. Civilian casualties reported at present are: Killed, 1; injured, 6.

Material damage was slight. Our machines went up and anti-aircraft guns came into action, but without result.

THE CASUALTY LIST.

Reported August 29th.

KILLED.—Best, Sec. Lt. D. K., Essex R. and R.F.C.

Brown, Sec. Lt. E. J., R.F.C.

Dunstan, Sec. Lt. H., Y. and L. R., attd. R.F.C
Forsaith, Sec. Lt. H. J., R.F.C.
Sayer, Sec. Lt. H. L., R.F.A., attd. R.F.C.
Tobin-Willis, Lt. J. G., A.S.C., attd. R.F.C.

WOUNDED.—Gough, Sec. Lt. H. S., Manch. R. and R.F.C.
Hay, Lt. O. D., Gord. High. and R.F.C.
Turner, Lt. M. W., R.G.A. and R.F.C.
Van Ryneveld, Maj. H. A., M.C., R.F.C.

MISSING.—Barton, Lt. A. E. S., R.F.A. and R.F.C.
Churchward, Sec. Lt. H. A., Yeo. and R.F.C.
Glover, Lt. A. M. T., K.O.S.B., attd. R.F.C.
Leighton, Lt. R. T., Yeo. and R.F.C.
O'Brien, Sec. Lt. P. A., R.F.C.
Phelan, Sec. Lt. R. S., R.F.C.
Raper, Sec. Lt. S. E., Sea. High. and R.F.C.
Roadley, Lt. T. S., S. Staff. R., attd. R.F.C.
Thompson, Lt. C. D., H.A.C. and R.F.C.
Waters, Lt. C. B., Lond. R. and R.F.C.
Wright, Lt. M. T., L. N. Lan. R. and R.F.C.

CANADIAN FORCE.—KILLED.—Doran, Lt. F. B., Cent Ont. R., attd. R.F.C.

WOUNDED.—Cooke, Lt. W. R., M.G.C., attd. R.F.C.

MISSING.—Gray, Lt. L. V., Sask. R., attd. R.F.C.
Joslyn, Lt. H. W., Sask. R., attd. R.F.C.
MacFarlane, Lt. J. L., B. C. R., attd. R.F.C.
McNally, Lt. P. B., Alta. R., attd. R.F.C.

PREVIOUSLY REPORTED MISSING, NOW REPORTED PRISONER IN GERMAN HANDS.—Sliter, Lt. E. D., Rly. Troops, attd. R.F.C.
Reported August 30th.

PREVIOUSLY REPORTED MISSING, NOW REPORTED KILLED.—Hopwood, Capt. R. G., Rif. Brig., attd. R.F.C.

DIED OF WOUNDS.—Thorndike, Sec. Lt. F. H., Yeo. and R.F.C.

WOUNDED.—Macfarlane, Capt. A. L., R.F.C.
Mackay, Sec. Lt. G. F., R.F.C.
Scudamore, Sec. Lt. H. G., R.W. Kent. R., attd. R.F.C.

Missing.

August 24th.—R.F.C.—Parry 2758 Sgt. A. E. (Bargoed).

Previously Missing, now reported Died as Prisoners of War in Turkish Hands.

August 20th.—Devonshire Regt., attd. R.F.C.—Braund 2900 W. (Brampton).

August 21st.—R.F.C.—Butler 6242 2nd Cl. Air Mech. S. G. (Barry).

PERSONAL NOTICES.

Deaths.

BUCKERIDGE.—Lt. Guy Dennis Buckeridge, 60th Rifles and R.F.C., was killed as a result of an aeroplane accident at Swaffham, Norfolk, on August 22nd, 1917.

The younger son of Major and Mrs. A. D. Buckeridge, Johannesburg, South Africa, he was born in 1894. Mr. Buckeridge served with the Burgher Commando in the Orange Free States from the outbreak of war until the end of 1914, after which he joined the S.A. Mounted Rifles and went through the German S.W. African campaign until the surrender at Otavi in July, 1915. He came to England for service with the 60th Rifles, and afterwards graduated in the R.F.C., in September, 1916.

After much work over the lines in France, he became Communication Pilot for G.H.Q. As such he was a familiar figure in many aerodromes in France, and will be missed by his many friends.

He was killed within a few days of his return to England.

In February, 1917, he married Janet, daughter of Dr. and Mrs. Rice, of Harwell, Steventon, Berks.

BUTLER.—An aeroplane, with two passengers, flying at a height of 1,500 ft. over Lincolnshire on August 27th, got out of control and fell in a field about two miles from a town. Both aviators were killed. The pilot was Capt. Butler, R.F.C., who was just home after twelve months' flying in France. His home was at Leeds. The other aviator was a Cadet.

BUXTON.—George Barclay Buxton, who was killed in a flight over the German lines on July 28th, was the third son of the Rev. Barclay Fowell Buxton, of Kobe, Japan, aged 24.

DAVEY.—Sec. Lt. Roland Alfred Davey, R.F.C., of Margate, was accidentally killed on August 8th, while flying abroad. He was 20 years of age.

HAY.—Lt. Roger Bolton Hay, M.C., West Yorkshire Regt., attd. R.F.C., previously reported missing on July 17th, is now reported to have died of wounds as a prisoner in German hands on that day. He was 22 years of age, and was the youngest son of the Rev. R. W. Hay, late rector of Garsdon, Wilts, and Mrs. Hay. He was educated at Dean Close, Cheltenham, and afterwards at Blundell's, whence he was proceeding to Oxford when war broke out. With his two brothers he joined the Universities and Public Schools Brigade, and in January, 1915, all three were given commissions and gazetted to the West Yorkshire Regt. In July, 1915, he was ordered to the front, but owing to a motor-cycle accident did not go out until February, 1916, from which date he served in the trenches until August, when he joined the R.F.C. and returned to England. After obtaining his pilot's certificate he again went to the front last April In June he was awarded the Military Cross. The official notification states :—"On several occasions he has shown the utmost courage and dash in attacking and dispersing hostile aircraft in superior numbers. His willingness to undertake the most hazardous duties has at all times set a fine example to other pilots and observers of his squadron." His commanding officer writes :—"His loss to my squadron is considerable in more ways than one; first, he was a top-hole pilot, a thorough sportsman, a brave and plucky fighter, who, as you probably know, downed more than one hostile machine. He was probably one of the best liked and most popular officers in my squadron."

His observer in a letter writes :—"My pilot and I were attacked by six enemy scout aeroplanes. To start with, my gun jammed, and we were then pretty well helpless, and it was impossible to remedy it. We were a good many miles over the line, and my pilot made a really wonderful fight from 14,000 ft. down to the ground; he looped, spun, and did everything he could to shake the enemy off. He was badly hit in the body towards the end and had to land on the beach. We got out, and I helped him along when I was shot in the leg as I was doing so. It was awful bad luck, for we were only about three to four hundred yards from our line."

KEYSER.—Lt. Richard Keyser, R.F.C., whose death was announced last week, was educated at Uppingham School. When the war broke out he left Smyrna with 20 young British residents and joined the colours. As second lieutenant in the East Lancashire Battalion he was present at several engagements in France, and was promoted to the rank of lieutenant. Subsequently he was ordered to Salonika on special duty as an intelligence officer, but later transferred to the R.F.C., and after a course of training in Egypt, where he obtained his wings, returned to England six weeks ago.

KINKEAD.—While flying along the south coast on Sept. 3rd, Lt. Kinkead, R.F.C., nose-dived from a height of about 300 ft. and fell into a meadow near the railway line at Worthing. He was killed and his machine was smashed to pieces.

MALONE.—Reginald John Malone, R.F.C., who was killed while flying in England on August 30th, was the only child of Mordred and Ethel Malone, Bedford, and grandson of Col. Malone, Baronston, Westmeath. He was 17½ years of age.

MARSHALL.—Sec. Lt. Herbert William Hare Marshall, R.F.C., killed in a flying accident in Lincolnshire on August 26th, was the only son of Col. H. S. Marshall, 28th Punjabis, and Mrs. Marshall, of 19, Exeter Road, Weston-super-Mare. Born in 1890 at Mussouri, India, he was educated at Clarence School, Weston-super-Mare. He went out to Canada at the age of 17, and had a varied experience in farming, banking, and real estate. He also spent 18 months in California. He was a member of the Imperial Bank of Canada when war broke out, and at once enlisted, together with his brother-in-law, Capt. Erland G. Hadow, M.C. (killed in action on May 29th), in a Canadian contingent, and came over to England in 1915. Subsequently he obtained a commission in the West Yorkshire Regt. He served six months in France, and then joined the Flying Corps, and gained his wings in Oct., 1916. He again went to the front, and there met with a smash, which caused his return to England. Lt. Marshall was married on May 12th to Evelyn M. Orr-Ewing, of Weston-super-Mare.

AERONAUTICAL ENGINEERING

SUPPLEMENT TO "THE AEROPLANE"

INCORPORATING AIRCRAFT ENGINEERING, AERODYNAMICS, AND MATTERS PERTAINING TO THE AERONAUTICAL ENGINEER AND THE AIRCRAFT TRADER

Screws and Screw Threads in their Relation to Aircraft Construction.

BY V. P. BENEDICT.

Introductory.

So fundamental a necessity obtains for the strictest interchangeability and most systematic standardisation of all screwed parts and components employed in this—the newest and most progressive of industries—that a short exposition on the subject of screw threads is in strict accord with the instructive character of the Aeronautical Engineering Section of The Aeroplane.

The remarks appended make no pretensions in the direction of exhaustive review—rather they are to serve the definite purpose of amplifying and explaining in simple, non-technical language those tables of Standard Threads which follow.

Historical.

The principle of the screw thread is one of great antiquity; yet comparatively recent are all attempts to evolve ordered and reasoned standards out of the chaotic mass of forms and dimensions of screws originally employed in various industries and the works engaged therein.

Credit for the pioneer endeavours to standardise on a national scale lies to this country, and to Mr. (afterwards Sir) Joseph Whitworth, an original member of one of the then largest engineering concerns in the Kingdom, acknowledgment is due for his most energetic research work and the keenest advocacy of the necessity for uniformity of practice—not in screw threads alone, but in dimensions and forms of detail mechanical products generally.

To comprehend the extent to which interchangeability has been achieved, and its effect on aeroplane construction *en masse*, one needs only to consider the heterogeneous medley of separate establishments, of the most diverse calibre, and totalling in round figures well over one thousand, which are engaged in turning out in bulk the multitudinous pieces which are to assemble, without any regard to their source of origin, into the winged weapons of this most modern of warfare. This much visualised, ones debt to Sir Joseph Whitworth particularly and to his contemporaries for the foresight they exhibited may in some measure be appreciated.

Sir J. Whitworth's system of screw threads of 55 degree angle, approximately triangular in outline and with corners rounded, is now universally known as the English Standard Whitworth Thread. Varying ratios of dimensions have been adapted for different needs, the one outline being retained and used on 95 per cent. of engineering production.

This Screw Standard was not adopted without great expense and much controversy and opposition from those to whom the change meant the scrapping of existing forms, and thus it was regarded as preferable, rather than to devise a new form strictly theoretic, to adopt and standardise an outline or section and dimensions, which, as explained in the Whitworth paper entitled "A Uniform System of Screw Threads," laid before the Institute of Civil Engineers in 1841, consisted of a compromise approximating to the most commonly used of the then existing forms.

Such, then, is, in brief, an account of the first accepted National Standard form of thread, and although there appeared a preponderance of foreign opinion in favour of the angle 60 degrees, there is little tangible in the way of objection to the Whitworth form, and certainly nothing which could have weighed against the great advantage to be gained by employing the more generally favoured form at the then time in vogue.

The adoption of standards by the engineering communities of other countries naturally followed.

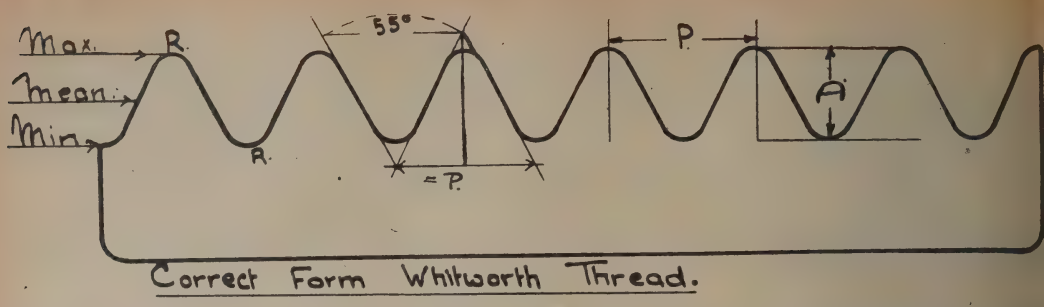
In the case of the United States they were—for a nation so progressive in things mechanical—surprisingly dilatory and procrastinating.

It was more than 20 years later that a Special Committee of the Franklin Institute was appointed "to investigate and recommend a Standard Screw Thread System for use in the United States."

Various forms were considered, and, naturally, the Whitworth English Standard, already long established, came under discussion, in the course of which the chief expressions of objection related to an angle of the somewhat odd figure of 55 degrees being less easy to lay out than the even 60 degrees, and also to the disadvantage of the rounded corners from a production point of view, as compared with plain flats.

Finally, the recommendation was made that the form and system of Mr. Wm. Sellers, based on the 60 degrees angle, and without rounded corners, be selected for acceptance. There appears, however, to have been some lack of comprehensiveness in the scheme as laid down, militating against complete interchangeability, since it is recorded that some years later (about 1876), after the system had been adopted some time by the Erie Railroad, this concern found it necessary to initiate an investigation into the difficulties which were being experienced in assembling screwed productions from their various shops.

Ultimately, however, in '82, after many years spent in discussion, the system appears to have been perfected into the existing United States Standard. Which all reads amazingly like a present-day comment on progress official in things aeronautical.



Turning to the Continent (discovered by Roosevelt, and labelled "Yurrup"), here the Metric System obtains, and an attempt has been made to evolve and adopt a definite standard of form and dimensions for universal use. The result is the thread known as the "Système International," recommended for acceptance by the International Congress for the Standardisation of Screw Threads assembled at Zurich in October, 1898, and based on the somewhat older French Metric Standard, agreeing in general therewith, subject to an unfortunately obscure amendment in outline, of which more anon.

The small screw system, known as the B.A. (British Association, by whom it was adopted in 1881) is, with slight exception in form, the same as that formulated by Prof Thury, and put forward by him in '76 to a Committee of the Geneva Convention called to consider a standard of small screws for the particular purposes of the watch, clock and instrument industries.

Technical.—(1) Thread Forms or Sections.

The scope of this article is screw threads only so far as they apply to aeroplane construction, which limitation obviates the necessity to consider any but the "Vee" or triangular form—which is decidedly to the good in economy of words, for the basis of all these is an abbreviated isosceles triangle, so that a description or illustration lies generally, and dissimilarities call only for figured dimensions.

Taking, as is meet, the Whitworth form for my pictured example, the section is shown analysed, and reveals no less than seven separate and actually dimensioned elements. A fearsomeness more apparent than real, at one with most text-book and drawing office productions, clothed in symbols—mystic—wonderful, the whole intent of which is, nevertheless, capable of the simplest translation.

Correct Form Whitworth Thread.

From the like did Euclid coin his name and fame (and his coin, if any), for his art was the taking of basic essentials to be garlanded in fullest measure with the less obvious adjuncts therein contained and implied.

The screw thread formula is Euclid pure and simple.

In sectioned outline it is like to a row of blunt-nosed triangles, arranged consecutively, whereof the bases touch, and the inclined sides partially enclose spaces of identical form and dimensions.

From the seven thread elements one need take only two essentials, namely, the angle and the pitch. Use the pitch for a base length and project thereon the inverted angle thus to form the completed triangle—in itself a perfectly good theoretical thread form (and one used, *vide* the "sharp vee thread" occasionally met in American practice and—more often—in Yankee text-books) upon which all variants in standards of vee form are based.

Wherein lies simplicity, for in each standard form of thread the angle always remains a set and constant factor, and, from the variant element, the pitch, calculable every time as a set proportion of it, one can obtain strictly uniform ratios for each of the other dimensions.

It is written above that the triangular form in itself is a perfectly good theoretical thread outline, so it is good that one enlarges somewhat on the reasons for varying it. From a practical point of view, in the first place, sharp edges and corners are an abomination to produce, and when produced are extremely sensitive to damage and wear, alone sufficient grounds for avoiding them and applicable to mechanical products generally besides screw threads.

On the point of strength, too, the balance of advantage is against the full triangle. Sharp corners are notoriously obnoxious on the score of weakness they set up. Witness the ease with which a hefty bar of tough material can be snapped if a sharp notch is cut at the point where the break is desired. Still further, the actual tensile strength of a male screwed part is governed by the area of the core, which is equal to the amount of material left untouched by the screw-cutting, and which would remain if the thread were totally removed. Obviously, in cutting a thread on a given diameter—say 1 in.—by abbreviating the triangles, starting them as it were at a point part way down the slope from the peak, and by ending them off before they run to a pointed groove, one does not cut so deep into the metal, and thus leaves a larger core untouched.

So much, then, will suffice for the why of the outline abbreviation.

The application of Euclid to the triangle described as formed by the pitch length for base, with the 55 degree angle projected thereon, I will proceed with in the following *pot pourri* paragraph.

The triangle formed is an isosceles one, of which breed the height is always a set proportion of the length of the base, dependent on the angle between the sides. Sticking to Whitworth, his angle is 55 degrees, and the height from the centre of the base to the peak will invariably be 0.96049 times the length of the base, and the base is equal to the pitch, so one gets the height every time, and if one calls it 0.96 times the pitch, one will be near enough to pass inspection. The abbreviations are each one-sixth of the height and, therefore, one-sixth of 0.96 times the base/pitch, and, therefore, again 0.16 times the same. And if from 0.96 one knocks off 0.16 for the short peak and the same for the root, it leaves one with 0.64 times the base/pitch for the total remaining depth of thread.

Reverting, then, to the illustration and its seven-dimensioned elements, the first is the maximum diameter. This is given in the screw designation in company with the pitch, so needs no seeking. It may be referred to as the nominal size. As example, a male screw called for as ⅜ in. by 16 T.P.I. (threads per inch) would be cut on a piece of circular section ⅜ in. in diameter, and this is the diameter measured across the peaks of the threads which should remain when the screw is cut. If it does not, two A.I.D. marks and the scrap heap.

Secondly, the pitch is the distance in a straight line which is taken by one complete turn of the screw, otherwise the distance from the peak of one thread to the peak of the next. Given correctly—*á la* text-book—the pitch is the distance in a straight line measuring parallel with the axis of the screw between two adjacent sides of like inclination, and properly taken at a point halfway between the peak and the root, which point is named the pitch-line and also the effective diameter. All to show how ingeniously and obscure the simplest of definable things can be made.

The value of the pitch is one inch divided by the number of threads contained in that length. Thus, 16 T.P.I. is the usual method of designating a screw having 16 complete threads in one inch of length—giving one-sixteenth inch pitch. It is not correct to refer to 16 pitch, as is frequently done, but always one sixteenth inch pitch. When one comes to Metric Threads one is saved any confusion, since T.P.I. enters not, and the pitch is always plainly expressed as such in millimetres, thus, 1.5 mm. pitch, 2 mm. pitch, etc., etc.

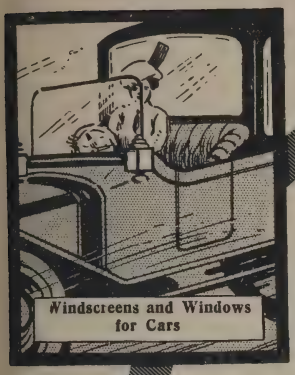
Thirdly, the angle, which, as already stated, is a set figure for each Standard Thread form, and is 55 deg. in the case of the Whitworth. Measured between any two adjacent and opposite inclined slopes, it is correctly defined as an "included angle," meaning the number of degrees included between any two given slopes, and not the angle which each makes with the centre line or with the base line.

These are the essentials—these three dimensions, which are given one and need no seeking, and the remainder are the adjuncts thereto.

The more important is the root or core diameter, measured between the base of the grooves left by the threads from one side the screw to the other. As I have shown the depth of the thread in Whitworth form to be 0.64 times the pitch, one needs to deduct twice this amount (one for the depth of thread on each side) from the nominal or outside diameter to obtain the core dimension.

Then one has the mean diameter—which is the pitch diameter—or the effective diameter, a point very difficult to measure without special instruments and gadgets, which, since it lies halfway on the slopes of the threads between peaks and roots, is obviously dimensioned halfway between the maximum or outside and the minimum or core or root diameters. Simplest to arrive at by deducting one depth of thread (the equal of two half-depths), that is 0.64 times the pitch, from the outside diameter.

And, finally, one has the dimension and the form taken by the peak of the thread, and also the shape given to the root of the groove. These are equal in the Whitworth section shown, being each radiused by 0.137 of the pitch, and removing the sharp corners to the extent of 0.16 times the length of the pitch.



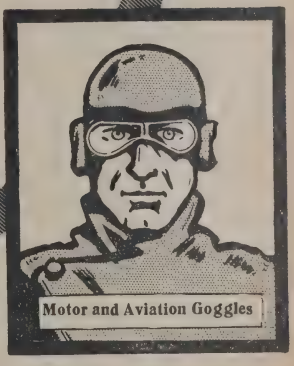
Which completes all that need be said of the Whitworth section or outline of thread of itself. In a later paragraph will be given a brief description of, and the uses for, the various schedules of pitches in relation to outside diameters which have been officially adopted for differing purposes.

The British Association Thread.

Turning from Whitworth, one comes to a thread much used in aeroplane work, namely, the B.A. Essentially a small screw thread, it is used for nothing larger than 6 mm., or just under ¼ in. Its importance lies in the fact that it serves as a downward continuation of the B.S.F. Thread table, whose smallest size is ¼ in. Its two sizes No. 2 and 4 (approximately 3-16th and ⅛ in. respectively) in company with the B.S.F. Table from ¼ in. to 1 in. form the Standard Screw Schedule of the British Automobile Committee.

The angle of the slopes is 47½ deg., a somewhat odd figure, and the peaks and roots are rounded off by approximately 2/11th of the pitch, leaving a total depth of thread equal to 0.6 of the pitch. This thread in all its dimensions is based on the Swiss Instrument Standard Thread, but the rounding of the top and bottom have been made uniform instead of differing slightly, as originally designed by Prof. Thury.

All remaining threads, in which one is interested, have the angle the nice round figure of 60 deg., which makes the triang



The Wonderful Properties

of Triplex Safety Glass have made it a commercial necessity in every branch of automobile and aeronautical engineering. Absolutely unsplinterable; cannot "fly" if broken, and yet is as clear as plate glass.

TRIPLEX
SAFETY GLASS

equilateral, giving three sides of even length, and each of the three included angles the equal figure of 60 deg.

The United States Standard and the old French Metric are identical in outline, the only difference between them, of course, is that the one is dimensioned in inches and the other in mm.

The height of the 60 deg. triangle is 0.866 times the base, and the peaks and roots are simply flatted by $\frac{1}{8}$ of the pitch length each, leaving 6/8ths or $\frac{3}{4}$ of 0.866, that is 0.6495 times the pitch for the total depth of the thread. The mean or effective diameter is, therefore, the outside size, minus 0.65 times the pitch, and the root or minimum diameter is a similar amount still less.

The flat form of peak and root is considered more facile of production than a rounded one. Certain it is that this form is less trouble to set out owing to the even-figured angle, and the flat peaks look after themselves if the groove is formed the correct depth and shape.

The other Metric thread, the Système International, is that put forward for adoption by all nationals universally. A very laudable object, but one which will await fruition until the Metric system of weights and measures is likewise universally adopted.

In actual form or section the difference from the French Metric outline is simply that the root of the groove is recommended to be allowed a little extra depth for clearance, together with a slightly rounded profile. The peak is flattened, as in the others. The object of the extra depth is to ensure adequate clearance between the same and the flat peak of the counterpart thread when inserted, and, in effect, it does probably allow the other dimensions to be worked much closer to standard size in both the male and female parts without the fear of binding, since in practice it is found that the groove is the first element to go wrong, owing to the cutting edge, which forms it, being the first part of the tool to wear, thus leaving the groove slightly insufficient in depth.

It is much to be regretted that the Congress which recommended the system did not tie this clearance down to definite dimensions, as many people are very hazy as to what is requisite. All the data they gave was a fixed maximum of 1/16th the triangle height, and the form was left optional. However, the officially approved and very general procedure is to round out the groove to a depth of not less than 1/24th, and not more than 1/16th of the triangle height.

A word of warning as to the effect of this haziness in definition. Having no fixed data to go upon, practically all the text-books give the depth of thread for the S.I. at identically that of the French Metric, which obviously is making no allowance for the extra clearance. In using these tables, therefore, to arrive at core diameters, it is necessary to deduct from the figure given twice the proportion of the pitch which is represented by the clearance adopted.

In producing Metric S.I. Threads, however, provided that the maximum is not exceeded, no great importance attaches to this clearance, since, if the other elements are correctly formed, the male and female screws will assemble satisfactorily, as will the U.S.S. and French Metric, which have no clearance. Any clearance at all will really comply with the recommendations, and, from the standpoint of core strength, obviously the less taken out the better.

Remains only the section of the C.E.I. (Cycle Engineers' Institute) to be dealt with. Adopted originally to cover the need of the cycle trade for interchangeability, this thread is rather shallower in cut than the others, owing to a greater amount rounded off top and bottom, suited for this reason, to screwing very small diameters like wheel spokes, and also very thin steel tube when the thickness of the wall is insufficient to take other standards of depth. The angle is 60 deg., and the profiles rounded one-sixth the pitch. The remaining depth of thread is equal only to 0.5327 of the pitch, and is the shallowest of all that one is called upon to consider.

Technical (2).—Pitches and Diameters.

The bigger in diameter the part to be screwed the deeper can be the section of the thread to be cut thereon, and obviously it is no use to adopt a set outline of thread without laying down also the proportions its dimensions should bear to the various diameters of objects to be screwed. In order to ensure strict interchangeability between different firm's products, it was, therefore, necessary to compile a progressive schedule of pitches to suit the various diameters.

The whole of these schedules which apply to the Aeroplane industry are given in the accompanying tables, which supply adequate data for any thread with which one is likely to meet.*

Thus, for each standard the outside or nominal size is given together with the pitch or number of threads to be cut per inch of length. The angle is stated at the head of each column, with the thread depth and form of top and bottom profile. To render the tables of the utmost service each screw has its core diameter stated, from which, in conjunction with the nominal size, the

effective diameter, which lies halfway between the two, can readily be ascertained without protracted calculation or formulæ, as also can the depth of any particular thread, since it is half the difference between the nominal and core diameters.

Taking these schedules in their order as printed, a word as to their origin and the purpose each serves should be of interest.

The first is the English Standard Whitworth (E.S.W.) or (S.W.), the original schedule of Sir Joseph Whitworth, which he put forward in conjunction with the Whitworth Section of Thread, and adopted some 70 years back for general engineering purposes. That it was a really admirable one may be gauged from the fact that the U.S. Standard of pitches closely approximates to it. The actual authentic standard covered no size below ¼ in., but the list was later extended to cover the small sizes, which should strictly be referred to as the English Whitworth Small Screw Threads. However, since these were generally accepted in this country along with the schedule proper, they are now regarded as forming part thereof, and distinction is seldom made. This is, however, the reason why many tables are still printed with no mention of sizes below ¼ in. diameter.

Now the Whitworth Standard Thread provides what is known as a fairly coarse screw, where the pitch is large proportionately to the diameter, and being the basis of the other dimensions as has been seen, the resulting screw is rather deep, particularly in the smaller sizes, say from ¼ in. to ⅝ in. Apart from the weakness of the core against tensile stresses, the traverse of the thread is too steep to allow delicate adjustments, nor will nuts under tension remain firm so well as with a finer pitch. For these reasons, although perfectly satisfactory and most generally used on the older kinds of engineering work, it is not greatly in favour for automobile work, and less so in aero-construction.

There are certain particular services, however, where the coarse depth of thread is advantageous, notably in the case of studs or bolts which are to screw into aluminium castings. Here the great grip obtained by the deep thread is desirable, and little note need be taken of the lower tensile strength left in the core, since that of the castings is much lower than the steel screw. The danger is really greater of the threaded hole stripping, that is the whole thread breaking away and pulling out. Whitworth threads are also frequently used where there is no great strain, as in holding detachable aluminium covers and oil pumps and crank-case bottoms, which usually require a large number of small bolts, and where considerable time is saved by the coarser pitch in assembling these, since fewer turns are required to screw the bolts home.

British Standard Fine.

In English aero practice it is the British Standard Fine Thread which is almost universally adopted for general screwed work. Known as the B.S.F., and sometimes called the B.F.T., it was greatly in favour in automobile practice, and its lower sizes, from ¼ in. to 1 in., were recently adopted as standard for car work.

This thread is found on nearly all screws, bolts, pins, nuts, etc., on British-designed machines and engines. The core diameter is of a good strength, as will be seen by comparing the two first of the tables. Take, for instance, the ¼ in. Whit., with its core 0.186 in. The reduction here, from the nominal diameter of 0.250 in., is 25 per cent., whereas the 0.200 in. core of the B.S.F. equals a reduction 20 per cent. only. For 5/16 in. the reduction is 22½ per cent., against 18⅓ per cent., and for 1 in. Whitworth is 16 per cent. against B.S.F., 12½ per cent.

And here will also be noted an apparent anomaly, common to most screw tables, which is the gradual lessening in the percentage of reduction as we progress to the bigger diameters. This is due to the fact that in large sizes the strength of a coarse screw is nearly identical with that of a finer one, from the point of view of resistance to clean shear. The mean strength of any thread lies at the pitch or effective diameter line, where, in a correctly formed section, the amount of metal removed is exactly equal to the amount remaining, so that at this point the thickness of the one thread is exactly equal to the thickness of the counter-thread which bears against it. There is, therefore, no cause to cut our larger diameters of screw so deep in proportion to the smaller ones, and since the smaller the section of thread cut the less metal to be removed, and therefore the cheaper to produce, and the stronger at the core, the ratio decreases as our outside diameter gets larger. A factor which has to be considered is the number of threads to be given the nut, because this is usually as thick through as the diameter of the male screw, and with too fine a pitch not only would time be wasted in screwing it home, but excessive strain might be set up owing to the great leverage on a fine screw thread.

It should be noted that the 26 T.P.I. for ¼ in. size, B.S.F., is a recent amendment, not correctly given in many printed tables. The old figure was 25.

British Standard Pipe.

The British Standard Pipe Thread (B.S.P.), the next table shown, is a further case where the Whitworth thread outline has been adapted to a special purpose by varying the relation of pitch to outside diameter.

The necessity for this table lies in the fact that a pipe of large diameter has relatively little metal in the wall on which to cut a screw thread. Take a pipe of 3 in. outside diameter and 2⅜ in. bore, the Standard Whitworth and the B.S.F. would both have to be cut deeper than the thickness of metal would accommodate, which is why one has to set up a special table of pitches.

Note a peculiarity in this table. There are only six different pitches to cover all diameters from ⅛ in. to 18 in. inside bore. Apparently extraordinary, but capable of horse sense explanation. The pitch is scarcely governed by the diameter at all, but by the wall thickness, and since the wall thickness over a certain range of diameters is left the same, the pitch of screw can be served likewise.

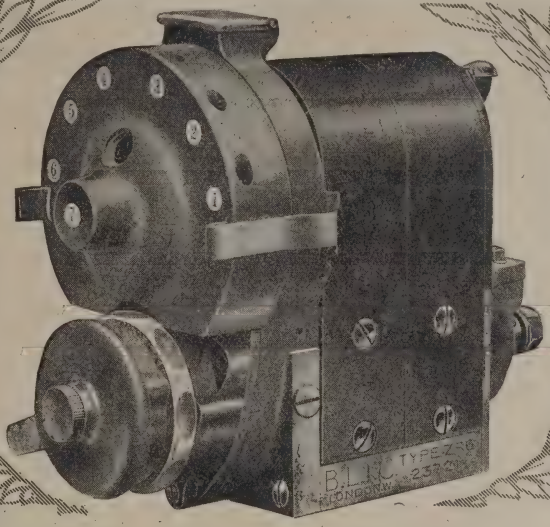
A second peculiarity is that the gauge size or top diameter of thread is well under the outside diameter of the pipe, the reason being that the male screw on the pipe is intended to be cut on the taper to the extent of 1/16th of an inch for each inch length of thread, the gauge size taken is the centre of this taper and therefore, greater than the small end and less than the large which latter is in turn slightly under the outside diameter of the pipe to ensure getting a good thread despite the roughness and error from the circular form usually found in this class of pipe.

And since one does not use common gas piping in the business unless for shelf racks in the stores, why is this interesting? Well, the standard pipe thread has always been used on the corresponding unions, nipples and nuts, which, unlike the pipes themselves, need not be cut on the taper, and this form of thread was adopted by the automobile trade for its inlet, exhaust, oil and the like pipe unions, and has similarly become attached to the aeroplane trade, since it is decidedly a useful thread on large plugs and collars, such as valve seat collars, cylinder jacket plugs, and like fillings for large openings, since they (the fillers not the openings) are usually recessed and cut away so as to be light compared with their diameter, and thus generally resemble tube in the section where the thread is wanted.

Considerable use of it is made on parts not in the way of piping, where, from the inherent demand for lightness, the bulk of the metal is cut away to leave only a thin wall on which to cut threads.

Other Threads.

The C.E.I. Table of Threads, as has already been remarked, is designed for strictly special purposes, viz., spokes and their nipples for wheels, extra thin steel tubing, and a few other like sections.



The B.A. thread is one greatly used as a fine pitch thread on turnbuckles and most all screwed parts of diameter less than ¼ in. In its larger sizes, from No. 0 down to No. 10, it will be found to be employed in many places, in fact, in practically all where a small diameter screw is requisite.

The preceding paragraphs have covered most of the threads in general use, and very little need be said of the remainder.

Of metric threads, of course, many examples will be met, due to the great extent to which one used to rely on the French for aero-power units. Since many British firms are turning out numbers of engines to French designs, the tables will be found very useful. There appears to be no special schedule of fine pitch screws in Continental practice, but the metric standards are somewhat less in pitch than Whitworth Standard, and finer threads are seldom required. If they should be called for there would, thanks to the beauty of the metric system of measures, be no great difficulty, since a screw could be cut to any pitch in relation to its diameter, and occasion no confusion if even figures were kept to. Thus a crankshaft of 40 mm. diameter at its end could be screwed 3 or 5 mm. pitch if the standard 4 mm. was not thought suitable. The difference would be easily discernible and would be no trouble to recognise by measuring, much less, any way, than would be a similar departure from standard in our good old effete system of inches and vulgar fractions thereof.

And since American aeronautics loom large in the eye at the moment, particularly if the eye belongs to some sections of the non-technical press on either side of the pond, some attention should be paid to their two standards of threads. The two tables will be found very closely to approximate in pitch ratio to the English Standard Whitworth and the B.S.F. The one is a coarse thread for general engineering, and the other has the same form of outline, in a finer range of pitches, for automobile work. This latter it is which will be mainly found on those thousand (or is it to be millions?) of super-aerial-dreadnought-Hun-hunter which the lay press fondly imagine, or profess to, are now almost half-way across the Atlantic.

It seemed well to preface these tables with a brief résumé of several miscellaneous threads, which may be met in some channel or other of mechanics aeronautical, and to thus cover it a thorough manner, as befits any subject tackled in this progressive journal, screws and screw threads in their relation to aircraft construction.—V. P. B.

The High-grade British-built Magneto!

B·L·I·C

THE BRITISH LIGHTING & IGNITION Co LTD

The "B.L.I.C." Magneto is produced throughout by British Workmen in a British Factory — an organisation with many years' of practical experience in the manufacture of magnetos of the finest type.

The most careful scientific research into every detail, and the absolutely accurate standards of construction employed, have placed it in an unassailable position as the most perfect magneto yet produced.

*NOTE.—SYSTEME INTERNATIONAL. The form of this thread is identical with that of the U.S. Standard and the French Metric, with the additional provision of a clearance at the root or core of the thread. The outline given to the root of the thread to provide this clearance is optional, but clearance is not to exceed 1/16th of the height of the theoretical triangle formed by the slopes of the thread. A rounded profile recommended by the International Congress is generally that adopted by manufacturers. The figures given in the tables for depth of thread and core diameters are the theoretical dimensions without allowance for this clearance.

The Production of Aeroplanes and their Components

(Twelfth Instalment.)

BY STEPNEY BLAKENEY.

The Tail Plane.

The tail plane will now have to be considered. For the purpose of this article one may assume that the tail plane is almost semi-circular in shape and that the framework is formed of light steel tubing. This will be in four lengths; the first piece being straight, and forming the base or trailing edge of the plane, two pieces of tube forming quarters of a circle on each side, and one piece forming the centre portion of the leading edge, nearly straight.

It may be assumed that the diameter of the tube is about $\frac{5}{8}$ in., and that it is about 20 gauge. All joints have an internal liner pinned in position and brazed.

This, of course, must be well done, and although the oxy-acetylene blowpipe is a delightful instrument to do brazing with, it may be just as well to point out to all concerned that its use for brazing is not allowed by the A.I.D. Of course, there may be exceptions to the rule, but these exceptions apply to special circumstances, which I do not propose to deal with here.

Gas Brazing.

Therefore, one has to resort to the gas blowpipe, of which there are many makes. Those made by the well-known Warrington firm of Fletcher Russell and Co. may be relied upon to do good work, and for this light work an $\frac{1}{2}$-in. gas blowpipe is ample if a good supply of air and gas is obtainable. Some soft brass wire, or brazing strip, should be obtained, and although borax forms a very good flux, some of the brazing compounds now on the market are preferable, and in my opinion better results are obtainable.

Having prepared the semi-circular portions of the tail plane and tested the radii in a jig, these may be taken to the brazing hearth and the joints brazed and cleaned off. After the brazing is complete do not do as I once saw done, cool off with water. It is decidedly bad practice. Let the job cool itself.

Junction Pieces.

The next parts to put onto the semi-circular portion of the tube will be the right-angled junction pieces, which are specially-made steel tube fittings, for forming the connection with the straight tube composing the trailing edge of the tail plane. These will be pinned and brazed, or, as an alternative, sweated on with tinman's solder, after the semi-circular tube ends have been accurately cut to length.

Before this is done, however, slide on, into their respective positions, the hinge fittings for the elevator flaps, which have been milled and bored out of solid bar steel. The position of these hinge fittings involves working to the very finest limits of dimensions, and the greatest possible care must be taken to check their position before finally drilling, pinning, riveting and sweating them into position.

It is certainly most essential that a steel jig be first made and accurately checked and passed by the A.I.D., and used afterwards to locate the fittings accurately whilst being fixed.

Unless these precautions are taken, the tail plane will probably not fit standardised elevators, which may be made by another contractor, and will involve endless trouble to all.

Before fixing the straight tube into the right-angled junction pieces it may be as well to try the ribs of the tail plane in their respective positions, in case any special adjustment of lengths is necessary. This having been done, the straight tube may be finally fixed and the ribs, which are of box-section sheet steel, afterwards fixed and riveted into position, when the wooden stringer, which lies parallel with the trailing edge, has been passed through them. This work being done, the tail plane is complete except, of course, for the covering with fabric and doping.

Tail Ribs.

Having got so far it may be as well to give some idea of the construction of the ribs and of the method and design for a steel jig for making them.

The ribs, one can assume, are made of box-section sheet steel with suitable lightening holes, the steel being 24 gauge.

The first thing to do will be to make a steel former of bar steel about $\frac{3}{8}$-in. thick, less twice the gauge of the steel in thickness, and precisely the same length. The next thing to do is to cut out one of the steel blanks, out of which the ribs will be made, adding to the width the turn up all round to form the flange, plus the turn in, which will be about $\frac{3}{8}$ in. wide.

Having done this, lay the steel former on the blank of steel sheet and carefully locate it all ways in the centre. Then mark off the bolt holes previously drilled in the former, where the lightening holes come in the rib, and drill these holes in the steel blank. (See Fig. 17.) These two holes, in the former and the sheet steel blank, are for the purpose of temporarily fixing bolts to pass through and to hold the steel blank rigidly in position whilst being flanged on the former.

Before proceeding further, it will be necessary to make a female former in halves out of steel bar to fit on the partially-formed rib when the first portion of the flange all round has been turned up. This female former is for the purpose of preventing the steel rib from buckling when the last operation of flanging is being carried out.

A Composite Former.

As the first steel former could not be removed from the rib when all the flanging is completed, it must now be removed and replaced with a similar former made in five pieces (see Fig 17a). This being made in five pieces with the three centre pieces, Nos. 2, 3, and 4 removable, it is easy to see that when the double flanging is complete the work may be removed from the bench vice and the centre pieces removed. Then the two long outer strips, 1 and 5, can easily be removed from the rib.

PLAN OF INNER STEEL FORMER

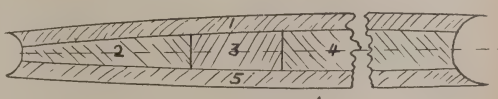

FIG. 17A

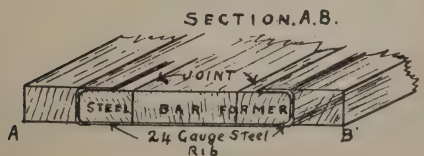
What remains then to be done is to mark off and cut out the lightening holes and finish up with a smooth file. Examine the finished ribs and make good any buckle, or defects, that may be observed.

Assembling.

After this the vertical sheet-steel web-stiffeners may be riveted in position to prevent the web from buckling under load. This having been done, the rib may be examined, and, if passed, sent to the A.I.D. After which it may, with the others, which are of varying lengths, be assembled in the framework of the steel tube, thus forming the entire frame of the tail plane when riveted and sweated into position.

The method of rib making, above described, has given most satisfactory results in actual practice, and may be relied on generally. The trouble of making the steel formers is very quickly paid for owing to the speed and accuracy of production, as they permit of moderately-skilled workers being employed.



(To be continued.)

PLAN SHEWING RIB IN STEEL FORMER

FIG. 17.

SECTION A.B.

A PROSPECTUS RECEIVED.

The prospectus of the "Dutton Air-drafts'" School of Flying, of Sealand, Chester, has come to hand. This brochure sets forth the advantages claimed for the school by its proprietors, and those interested are invited to apply for a copy to the above address.

THE PATENTS INDEX.

The subjoined list of recent inventions has been specially compiled by The Aeroplane from the current Official Patents Records.

Patent Applications.

Adams, W. C. Safety and stability of aircraft while flying. No. 12195. August 25th.

Bourke, A. M. Anti-aircraft guns. No. 12183. August 24th.

British and Colonial Aeroplane Co. Aircraft fuselages. No. 12059. August 22nd.

British and Colonial Aeroplane Co. Engines for aircraft. No. 12060. August 22nd.

British and Colonial Aeroplane Co. Internal combustion engines. No. 12061. August 22nd.

Caplen, G. Aeroplanes. No. 12156. August 24th.

Cleathero, T. H. Tanks for aircraft, etc. No. 11933. August 20th.

Clifford, I. Levels for aircraft. No. 12087. August 23rd.

Doyle, D. Destroying apparatus for use against air and sea craft. No. 12217. August 24th.

Galle, V. P. Flying machines. No. 12025. August 21st.

Harvey, T. Means for communicating from one vessel, or aircraft, to another vessel which is submerged. No. 12051. August 22nd.

Holle, A. A. Aeroplanes. No. 11982. August 21st.

Huddleston, F. Automatic self-directing apparatus for marine and aerial destroyer torpedoes. No. 12193. August 25th.

Jackson, A. J. Projectile device for destruction of aircraft, etc. No. 12145. August 24th.

Mayrow, J. J. Aeronautical machines. No. 12113. August 23rd.

Meikle, G. S. M. Aerial and flat height and distance finder. No. 12223. August 25th.

Piccolomini, H. C. Pontet-. Spars, etc., for aircraft, etc. No. 11902. August 20th.

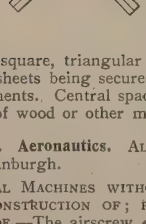
Rayner, E. S. Anti-aircraft gun mountings. No. 11925. August 20th.

Richinson, A. Method for discovering and signalling approach of airships and means of destroying them. No. 11965. August 21st.

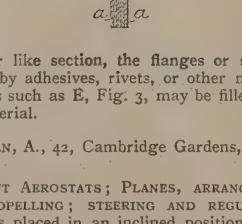
Ring, J. Indicating-instruments for use on aircraft. No. 11951. August 20th.

Robinson, H. M. Projection and propulsion of aerial torpedoes. No. 11979. August 21st.

Ross, C. B. Propellers or tractors for use in air or water. No. 11942. August 20th.



Complete Specification Accepted, prints of which can be obtained on and after September 13th, 1917.

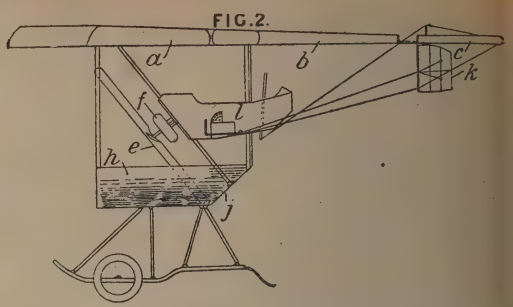


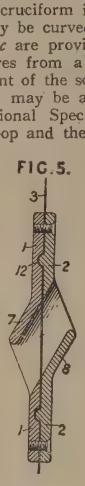
108,694. July 11th, 1916. Frost, C. R. B., and Thorne, G. Internal-combustion engines, more especially such as are used on aircraft.

Abridgments of recently published Specifications.

107,444. Girders, Stays, Joists, etc. Rutherford, H., Little Haugh, Banstead, Surrey.

Strong light stays, joists, girders, and the like, of ply-wood, are formed by combining two or more sheets or strips A, one or more of which is bent, to form stays and the like of X, T,

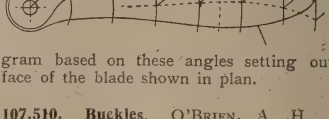




H, O, square, triangular or like section, the flanges or sides *a* of the sheets being secured by adhesives, rivets, or other metallic attachments. Central spaces such as E, Fig. 3, may be filled with pieces of wood or other material.

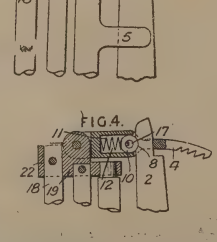
107,471. Aeronautics. Allan, A., 42, Cambridge Gardens, Leith, Edinburgh.

Aerial Machines without Aerostats; Planes, arrangement and construction of; propelling; steering and regulating altitude.—The airscrew *e* is placed in an inclined position under the plane *a*, *b* and above a curved scoop *h* closed by an inclined end *j*. The air acted upon by the screw is thrown against the plane above, and a partial vacuum is produced in the scoop which is therefore lifted and propelled by the air pressure on the bottom

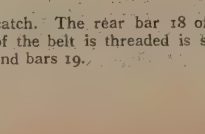


and end. The airscrew is driven by an engine or engines *f* which may be placed below or behind the scoop and may drive the screw shaft by a chain or bevel gear. The plane *a*, *b* may be cruciform in plan, and the longitudinal portion *b* of the plane may be curved in cross-section. Vertical and horizontal rudders *k*, *c* are provided at the rear of the plane and are controlled by wires from a car *l*. An auxiliary elevator may be provided in front of the scoop or on the front of the plane, and an additional car may be arranged behind the scoop. According to the Provisional Specification, the engine may be carried inside the scoop and the vertical rudder is fixed behind the scoop.

107,509. Aeronautics. Aeronautical Instrument Co., and Brewer, G., 33, Chancery Lane, London.



Aerostats.—The operating-cord of a valve or ripping-patch is passed through a fair-lead composed of two similar plates 1, 2 secured together so as to clamp the fabric 3 of the aerostat between them, the two plates leaving passage-ways which form a continuous oblique channel at the required angle to the envelope. Lips 7, 8 are formed on the plates to increase the length of the passage. The two plates have flat surfaces, or an annular projection 12 may be formed on one plate to press the fabric into a corresponding groove in the other plate, or each plate may have a cord laid in one of them. The space between the operating-cord and the passage-way is normally closed by a cork.



107,519. Screw Propellers. Garscadden, T. D., 139, Meadow Lane, Loughborough, and Boyne, W. K., Damhead Cottage, Kincorth, Bridge of Dee, Aberdeen.

The Specification describes means for determining the pitch angles of a propeller corresponding to different radii and from a diagram based on these angles setting out the effective working face of the blade shown in plan.

107,510. Buckles. O'Brien, A. H., and O'Brien, S., 68½, Curzon Street, Leicester.

In a readily releasable fastening for aviators, belts comprising a pivoted catch 4 for retaining a pivoted bar 2 of the buckle in engagement with the prongs 5, the catch 4 is held against accidental displacement by a spring-pressed ball 9, Fig. 2, or roller 10, Fig. 4, which engages a recess 8 in the bar 2. The ball or roller and controlling spring 11 are contained in a hollow portion 12 of the catch, the spring being disposed between the roller 10 and the inner wall of the cavity 12, Fig. 4, or between the ball 9 and a second ball 13, Fig. 2. When the catch is lifted, it is prevented from falling by the engagement of the ball 13 with a lug 14 to which the catch is pivoted. The roller 10 may work on a pin 17 fixed in the catch, as shown, or the pin may work in slots in the sides of the catch. The rear bar 18 of the buckle on which the tubular end of the belt is threaded is secured removably in sockets 22 in the end bars 19.

MARKET REPORTS.

Prices given are for quantities on usual terms.

August 30th, 1917.

COPPER.—The chief interest still centres round the conditions ruling in America. The position there, however, is still very uncertain. The U.S. Government have not yet fixed the prices at which metal must be sold to them, and the delay is causing the market to be very unsettled.

The latest news received from U.S.A. states that the strikes are not yet settled, and the effect upon output is very disastrous in consequence. There is every indication that there will be a serious shortage of refined material.

Prices here continue unaltered. One cannot, however, refrain from thinking that the officials will be compelled to make a further reduction in the prices ruling at present.

Current Prices.

Standard Copper	£120 per ton Cash.
Copper Sheet	£160 per ton.
Copper Tube, S.D.	19¾d. per lb.
Brass Sheet, 24 Gauge	15⅝d. per lb.
Brass Tube, S.D.	16½d. per lb.

TIN.—This market is at present in a very dull condition, although prices at present continue to favour buyers. It is, however, surprising to learn that there does not appear to be a rush to cover future demands. There appears to be ample supplies available.

Comparison of Prices.

August 29th	£242	10	0
August 24th	240	10	0
August 22nd	242	0	0
Last Month	243	5	0
Highest Price, 1916	205	0	0

LEAD.—Supplies for national requirements are well maintained, although there is a feeling that the effect of the recent strikes will shortly be felt. Prices here continue unchanged.

Official Prices.

Virgin Pig Lead	£29 per ton, Ex Ship.
Virgin Pig Lead	£30 per ton, Ex Store.
Sheet Lead	£39 10s. per ton, Deld. U.K.
Lead Pipes	£40 per ton, Deld. U.K.

STEEL.—Supplies continue to be the dominating factor, and the only security appears to be for consumers to look a long way ahead. It is expected that by the end of the year the output will be equal to the demand. This remains to be seen. The aircraft manufacturers' requirements continue to climb to heights beyond the expectation of the greatest optimist. At the same time one must admit that tremendous exertions are being put forth by the steel makers.

Prices still continue unchanged, and there does not appear to be any reason to expect an alteration at present.

Current Prices.

R.A.F., 1E Steel, 36s. to 40s. per cwt., Basis. (Black or Blue Reeled.)

R.A.F. 3B Steel, 78s. to 80s. per cwt., Basis. (Black or Blue Reeled.)

R.A.F. 9A Sheet Steel, 30s. to 32s. per cwt.

TIMBER.—The chief point of interest this week is an order issued by the Board of Trade commandeering all stocks of Mahogany and American Walnut.

"In pursuance of the powers conferred upon them by regulations 2B and 2JJ of the Defence of the Realm Regulations, the Board of Trade hereby take possession of all stocks exceeding in the aggregate 5,000 super feet of Mahogany in logs, flitches, planks and boards, and all stocks exceeding in the aggregate 5,000 super feet of American Walnut in logs, planks or boards in the United Kingdom at the date hereof.

"In connection with the foregoing notice of requisition, return forms and instructions as to the filling in of same have been sent to all the firms known to handle Mahogany and/or American Walnut.

"Any firms holding stocks (amounting to more than 5,000 super feet) of either wood, who have not received the necessary return forms, must obtain same by applying to the Controller of Timber Supplies, Room 216, Caxton House, Westminster, London, S.W.1.—Board of Trade, August 24th, 1917."

In view of the shortage of the woods referred to, due to an inefficient control, one would have thought that there would have been no necessity for such an order as the above. One does not wish to be hasty in passing any criticism, in fact, it is extremely difficult to understand what the effect of the order will be until further particulars have been furnished. In other words, the order lacks explicit details. One understands that it has received a very unwelcome reception among the Timber merchants.

It is reported that the Oregon and Washington Spruce producers have agreed on a fixed price to be charged to the Allies for aircraft Spruce. Very large demands are expected from the Allies, and the producers have agreed to supply them at £21 per 1,000 ft. board measure. This equals about £42 per Standard, f.o.b. The price appears to be very reasonable, and, after adding freight and charges, it should still be very much below the abnormal prices now being obtained. One presumes that the Air Board, if it has not yet had an opportunity of accepting the offer, will accept it when the Spruce producers have submitted it to them. Two important questions should be kept in view when reading the above offer. (1) Will the Air Board arrange for an efficient and capable inspection of the wood? (2) Will shipping facilities be afforded for sufficient supplies to be imported here to meet the ever-increasing and colossal demand of aircraft constructors?

As regards the former, recent experience does not give a feeling of confidence. In the meantime the situation continues exceedingly grave. The prices of all aircraft Timbers are soaring upwards, with very little hope of their dropping to a reasonable level, and, in fact, it is more than difficult to obtain supplies of certain woods at any price.

Current Prices.

Silver Spruce, 17s. 6d., c.f.
English Ash, 13s. 6d. to 15s., c.f.
Walnut, 2s. 3d. to 2s. 6d., s.f.
Mahogany, 2s. 2d. to 2s. 4d., s.f.

Prices include selection and delivery.

FABRIC.—The feeling of indignation at the absurd price charged by the Air Board still continues, and one is inclined to think that Lord Rhondda might do worse than give the question a little attention. One understands that the Air Board are charging Russian Flax to the spinners at approximately 600 per cent. more than they were paying when allowed to deal direct. Furthermore, the Irish Flax growers have been notified that the Government intend taking control of all Irish Flax. One is anxious to know at what price this will be charged to the spinners. Someone is apparently out to make a Government Department show a substantial profit, and it would not be surprising if the spinners did not insist upon an increase in price, in view of the atrocious prices they are compelled to pay for Flax.

Supplies are fairly satisfactory.

OFFICIAL PRICE.

FLAX AND FLAX YARNS.

Flax grown in the United Kingdom is to be taken possession of by the Minister of Munitions under an Order dated the 25th August. The text of the Order is as follows:

The Minister of Munitions, in exercise of the powers conferred upon him by the Defence of the Realm Regulations and all other powers thereunto enabling him, hereby gives notice and orders as follows:

1. He hereby takes possession as from the date hereof of:

(a) All flax of the 1917 crop grown in the United Kingdom as and when harvested.

(b) All flax grown in the United Kingdom at any time and not at the date hereof in the possession of a flax spinner for the purpose of his business.

(c) All other flax, except Russian flax, now or hereafter situated in the United Kingdom.

2. The flax, of which possession is hereby taken under paragraph 1 (a) and (b), will be divided under the directions of the Controller of Aeronautical Supplies into six grades according to its quality, handling, and cleaning, and the Minister will pay the following prices therefor:

Special grade—35s. per stone delivered at the appointed centre.
1st grade—32s. 6d. per stone delivered at the appointed centre.
2nd grade—30s. per stone delivered at the appointed centre.
3rd grade—27s. 6d. per stone delivered at the appointed centre.
4th grade—26s. 3d. per stone delivered at the appointed centre.
5th grade—25s. per stone delivered at the appointed centre.

Flax which is inferior in quality to that of the fifth grade hereinbefore mentioned will be paid for upon terms which will be subsequently communicated to the various owners.

3. If after this notice and Order any person having control of any flax of which the Minister has taken possession hereunder sells, removes, or secretes such flax without the consent of the Minister, he will be guilty of an offence against the Defence of the Realm Regulations.

4. No person shall as from the date hereof until further notice purchase, sell, offer to purchase or sell, or, except for the purpose of carrying out a contract in writing existing prior to the date hereof for the purchase of such flax, enter into any transaction or negotiation in relation to the sale or purchase of any flax situated outside the United Kingdom.

5. Further directions with regard to the delivery of flax of which possession is taken hereunder will shortly be issued on behalf of the Minister by the Controller of Aeronautical Supplies.

6. All communications upon the subject of this notice and Order should be for the present addressed to the Controller of Aeronautical Supplies and marked Flax Supplies, Dept. S. (m.A.)1, Air Board Office, Strand, London, W.C.2.

A second Order, dated the 25th August, issued by the Minister of Munitions, relates to wet spun yarn made of flax line, and is as follows:

(1) No person shall on or after the first day of September, 1917, until further notice, spin or manufacture any wet spun yarn made of flax line except under and in accordance with the terms of a licence issued under the authority of the Minister of Munitions.

(2) No person shall as from the date hereof until further notice purchase or take delivery of any wet spun yarn made of flax line except under and in accordance with the term of a licence issued under the authority of the Minister of Munitions, or sell, supply, or deliver any such wet spun yarn to any person other than the holder of such a licence as last aforesaid.

(3) All applications for a licence in connection with this Order shall be addressed to the Controller of Aeronautical Supplies, Dept. S. (m.A.)1, Air Board Office, Strand, W.C.2.

AN INCREASE IN WAGES.

Woodworkers engaged on the manufacture of aircraft have been awarded a wages advance of 3s. a week, to date from August 1st.

AIRCRAFT FITTINGS.

The Rotax Motor Accessories Co., Ltd., of Rotax Works, Willesden Junction, N.W.10, have issued an illustrated catalogue which should be of considerable interest to the Aircraft Industry.

In addition to lists of integral parts such as streamline wires, universal fork joints, shackles, shackle pins and so forth, the list includes illustrations, descriptions and prices of such details as tank caps and seatings, combined petrol and oil-fillers, strainer petrol tap and unions, aeroplane hand-pressure pumps and pressure gauges, hinges, door-fasteners and turn-buttons, accumulaters, terminals and switches and small accessory parts, provision for which has, of course, to be made in advance in order that they may conform with the general specification of the machine. Such a catalogue is, therefore, of considerable use in making preliminary selection. All important accessories and integral parts are passed at the Rotax Works by the A.I.D.

ITALIAN COMMERCIAL NOTES.

The "Italian Touring Club Gazette" points out how little the country between Rome and the nearest sea coast is for a great international aero terminus. The four main trans-continental lines would cross there, it being obviously essential to avoid any unnnecessary travelling over or organisation in the present enemy countries. I am convinced personally that few tigers ever lose their claws even when they change their spots. So the trans-continental lines must be "super-national." It rather looks as if there is going to be a great slump in frontiers—or rather in the barriers which are set up along them.

From the same source one learns that the U.S. Mission travelled about these skies, eight men in the same 'bus. Rather too like putting all one's eggs, etc., etc.—not that eggs even yet are as valuable as Americans.

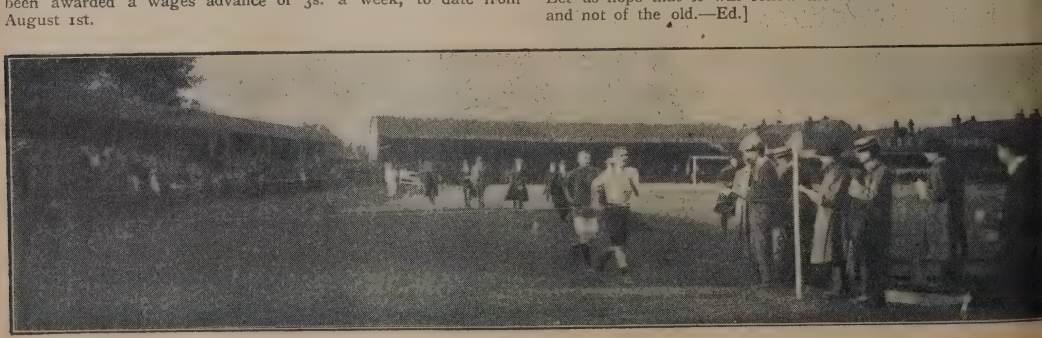
An enormous biplane, which escorted the party, beguiled the monotony of the trip by looping and other undignified modes of procedure, suggestive of moths, humming birds, and such small "volatiles."

The Editor of the journal claims for this country the merit of having the biggest existing flying-machine, the one with greatest horse-power, and the one that is fastest.

One has heard many hints as to this last, the latest feather in Italy's *hat*—or should I say *sky* or *wing*?—T. S. Harvey.

A NEW PROHIBITION.

A Proclamation has been issued prohibiting the importation into the United Kingdom, except under licence from the Board of Trade, of all machinery driven by power and suitable for use in cutting, working, or operating on wood, including sawing machines of all descriptions; general joiners; mortise, tenon and boring machines; lathes and rounding machines; scraping and sandpapering machines; saw-sharpening and setting machines; saw stretchers and brazing apparatus; and electrical motors up to one-half horse-power.



[These particular machines are of the kinds needed in aircraft factories. It is to be hoped that import licences will be granted freely to firms which supply the Aircraft Industry.—Ed.]

AMERICAN AIRCRAFT PRODUCTION.

A message from New York on August 13th states:—The Washington correspondent of the Associated Press states that neutral countries have been pouring in orders for American aeroplanes at such a rate that in order to preserve the supply for itself and the Allies the United States Government has been obliged to prohibit the export of aircraft except by licence.

A report from Washington on August 8th stated that Mr. Daniels, Secretary of the Navy, has arranged for the construction of a new aircraft factory at the Navy yard of Philadelphia at a cost of £200,000. The factory is to be completed in one hundred days, will employ 2,000 workers, and will produce a thousand small aeroplanes annually.

[Evidently a U.S. equivalent for the Royal Aircraft Factory. Let us hope that it will follow the methods of the new R.A.F. and not of the old.—Ed.]

THE SUNBEAM CO.'S CHARITY SPORTS.—An account of this function appeared in the previous issue of "The Aeroplane"

(*Continued from page 652b.*)

MARSHALL.—Sec. Lt. John Arthur Marshall, Cyclist Batt. and R.F.C. (previously reported missing, now officially reported killed in aerial combat on April 6th), was elder son of Capt. James Marshall, King's Royal Rifle Corps, of Hartford Cottage, Huntingdon. He was 19 years of age. He had his commission in the Army in December, 1914, and received his "wings" in November, 1916.

McLAREN.—Sec. Lt. the Hon. Francis W. S. McLaren, R.F.C., M.P. for the Spalding Division, met his death while flying at Montrose on August 30th. He was about a mile out at sea in fine weather at a considerable height when his machine was seen to descend rapidly, almost perpendicularly, and then to right itself again, move along on the level, and circle once or twice. When about 60 ft. from the water it suddenly dived straight down into the sea. Before a rowing boat from the beach reached the spot, two motor fishing boats had arrived, and after some difficulty Mr. McLaren, who was unconscious, was removed from the aeroplane. He had received severe internal injuries, and was badly hurt in the face, and his death took place just before the boats landed at the harbour. Mr. McLaren had been at Montrose since July. A military inquiry into the cause of the accident will be held.

Mr. McLaren was the younger son of Lord Aberconway, and was born in 1886. He was educated at Eton and Balliol, where he took honours in modern history, and afterwards became a member of the Inner Temple. When the war broke out he joined the R.N.V.R., and went with the armoured cars first to Belgium and later to Gallipoli, where his car took part in an advance and his driver was shot by his side. He accompanied the armoured cars when they were sent to Egypt. He spent some months there, but resigned from the R.N.V.R. when there seemed little chance of active service with the armoured cars, and came home and joined the R.F.C. Before his training was completed at Brooklands he became seriously ill, and remained so for several months.

At the very time when he had been pronounced well by his doctor Mr. McLaren learned, to his amazement, from a letter from a constituent, that without his knowledge he had been invalided out of the Army. For several months he besieged the War Office until at last he secured reinstatement, and although he was beyond the age when men are usually admitted into the R.F.C., he was after some delay readmitted and was posted to a flying squadron for training at Montrose. He was nearing the end of the advanced course when his death occurred.

He had represented Spalding in the Liberal interest since January, 1910, and while in the House was Parliamentary Secretary to Mr. (now Lord) Harcourt, when Commissioner of Works and Colonial Secretary. He was a J.P. for Denbighshire. Mr. McLaren married in 1911 Barbara, daughter of Sir Hubert Jekyll, K.C.M.G., and leaves two sons, aged three and two.

MORGAN.—Sec. Lt. Albert S. Morgan, R.F.C., previously reported missing, now reported killed in action on April 22nd, was the elder son of Mr. and Mrs. A. M. Morgan, "Deepdene," Manor Mount, Forest Hill, and formerly of Loughton, Essex.

NICHOLSON.—Sec. Lt. Geoffrey Shield Nicholson, R.F.C., who was wounded on August 21st and died in a clearing station on the following day, was the only son of Professor and Mrs. Shield Nicholson, 3, Belford Park, Edinburgh, and grandson of the late Professor W. B. Hodgson. He was born on August 9th, 1894. As a boy he was rather delicate, and after being at Merchiston he was educated privately for Edinburgh University. When war broke out he was in his second year reading for History Honours and the Law degree. He joined the O.T.C., and being much interested in flying went to the Beatty School at Hendon, and obtained his pilot's certificate in November, 1915. In the February following he obtained a commission in the Black Watch, was transferred in February, 1917, to the Royal Flying Corps, and got his wings in June. He had been flying at the front about six weeks. He was a well-trained musician and showed fine literary tastes.

PRITCHARD.—Sec. Lt. Thompson Thomas Pritchard, R.F.C., was killed whilst flying in North Wiltshire on August 9th.

ROBERTS.—Lt. C. Roberts, R.F.C., was flying at a great height near Hounslow Heath on August 31st when the machine nose-dived to the earth, the pilot being dead when picked up.

The mystery of the death of Mr. Roberts was not cleared up at the inquest at Hounslow on Sept. 3rd. The evidence showed that, when flying, the machine burst into flames, the wings fell apart, and that then there was an explosion, followed by a quick nose-dive to earth. Experts stated that the machine was in order before going up, and that the petrol tank was discovered after the accident sound and intact. No leakage, therefore, could have taken place, and the cause of the flames was unexplainable. A verdict of accidental death was returned.

SPEAR.—Sec. Lt. Norman Victor Spear, R.F.C., who was killed in a flying accident at Pulham St. Mary's Norfolk, on August 29th, was the youngest son of William Spear, F.R.G.S., of "Nordland," Woodstock Road, Golders Green, N.W. He was 29 years of age.

SILLEM.—Sec. Lt. Stuart Charles Sillem, R.F.C. (killed in action on August 12th), was only son of Mr. and Mrs. Charles Sillem, The Chestnuts, Minchinhampton, Gloucestershire. He was 19 years of age, and had his wings in June this year.

STUART.—Capt. James Stuart, R.F.C., Royal Inniskilling Fus., who was reported missing on April 13th, now officially reported killed on that date, was the eldest son of Mr. and Mrs. Stuart, Somerset, Coleraine, Co. Londonderry.

VAILE.—Lt. Laurence E. Stuart Vaile, R.F.C., who was killed in a flying accident in Norfolk on August 29th, was the elder son of the Rev. A. and Mrs. Vaile, of West House, Seaford, Sussex. He went out with the B.E.F. in August, 1914, as a dispatch rider, in which capacity he saw 2½ years' service. Last January he was gazetted to the R.F.C., where he graduated, eventually becoming an instructor.

ENGAGEMENTS.

LYSTER-SMYTHE—LEAROYD.—The engagement is announced of Lt. Cecil St. George Lyster-Smythe, East Surrey Regt. and R.F.C., second son of Col. Lyster-Smythe, D.L., R.F.A., and Mrs. Lyster-Smythe, and Eileen, daughter of Mr. and Mrs. Learoyd, Launde Abbey, Leicester, and Williamstown Lodge, Co. Clare.

SHAW—LAWSON.—An engagement is announced between Capt. John S. Shaw, R.F.C., eldest surviving son of Mr. and Mrs. J. G. Shaw, Royal Cross School, Preston, Lancashire, and Gladys K., second daughter of Mr. and Mrs. James Lawson, Latham House, Preston.

MARRIAGES.

BIRD—PEMBERTON.—On Aug. 25th, at the Parish Church of Chingford, Essex, Lt. Alfred Harry Bird, R.F.C., elder son of Mr. Harry Bird, C.C., F.S.S., and Mrs. Bird, of Chingford, was married to May Eveline, second daughter of Mr. and Mrs. A. S. Pemberton, of Chingford, by Canon A. F. Russell.

DICKINSON—WAUCHOPE.—On August 23rd, at the Parish Church, West Hampstead, Capt. C. J. Dickinson, R.F.C., elder son of Mr. and Mrs. W. R. Dickinson, was married to Janet Caroline Sutherland, daughter of Major and Mrs. C. J. Wauchope.

MURRAY—WOODRUFF.—On August 29th, at St. Michael's le Belfry, York, Major E. M. Murray, M.C., Q.V.O. Corps of Guides, attd. R.F.C., eldest son of Col. R. D. Murray, I.M.C. (retired), and Mrs. Murray, Nevern Square, S.W., was married to Gwladys Vivienne, only daughter of Mr. and Mrs. Henry H. Woodruff, of Barnsley and Harrogate.

ROBERTS—FEW.—On August 31st, at Folkestone, Patrick Roberts, R.F.C., son of the late Mr. and Mrs. Patrick Roberts, of Vancouver, B.C., was married to Vera Marguerite Fetherstonhaugh Few, younger daughter of the late Mr. and Mrs. A. B. Few, of Calgary, Alberta, Canada.

STEEL—BRADLEY.—On August 23rd, at S. Margaret's, Bentham, Frank Steel, Captain, Essex Regt. and R.F.C., youngest son of Charles Denton Steel, I.C.S. (retired), and Mrs. Steel, of Westcliffe-on-Sea, was married to Isobel May, eldest daughter of Robert Bradley, M.R.C.S., and Mrs. Bradley, of Bentham.

TOD—BATES.—The marriage between Sec. Lt. Malcolm Tod, Black Watch and R.F.C., youngest son of the late A. Maxwell Tod and Mrs. A. Maxwell Tod, of Heath Cottage, West Byfleet, Surrey, and Margaret Evelyn May, only daughter of the late J. Curling Bates, M.R.C.S., L.R.C.P., and Mrs. F. Curling Bates, of 62a, Central Hill, Upper Norwood, took place at Christ Church, Gipsy Hill, Norwood, on Wednesday, Sept. 5th (to-day).

BIRTHS.

JOHNSEN.—On Sept. 1st, at 72, Plaistow Lane, Sundridge Park, Kent, to May (née Bowater), the wife of Capt. W. O. C. Johnsen, R.F.A. and R.F.C.—a son.

TOWNSEND.—On August 27th, at Orchardleigh, Pinner, the wife of Capt. R. T. Townsend, Canadians and R.F.C., of a daughter.

The parents of Lt. Bernard Coombes, R.F.C., who has been officially reported missing, have been informed that, according to messages dropped by an enemy aviator in France, he and his observer landed in the German lines, and were made prisoners.

* * *

Sec. Lt. R. J. Grandin, A.S.C., attd. R.F.C. (sometime temp. Capt., A.S.C.), was reported missing on Western Front on May 18th. Mrs. R. J. Grandin, of 58, Anson Road, N., will be glad if those communicating with R.F.C. officers now prisoners in Germany, either in hospital or camp, will inquire as to the fate of the above.

Lt. Maurice Moore, York and Lancs Regt. and R.F.C., who was reported missing on July 22nd and believed killed, is now a prisoner of war at Karlsruhe. He is the youngest son of the Rev. J. Wright Moore, rector of Kirkheaton.

* * *

The "Times" correspondent, writing from British Headquarters on August 28th, says:—

The work of the Royal Flying Corps for the last complete week during which it is possible to tabulate the whole of the aerial achievements constitutes a record for any corresponding period during the war.

The number of hostile batteries successfully engaged with the help of aeroplane observation is well over 700, and the number of gunpits destroyed during this time is 128. More than 300 explosions were caused among ammunition dumps and other combustible material. This is counter-battery work with a vengeance. Bombs were dropped all over distinct military objectives.

The enemy aircraft brought down was 68, whilst another 90 were driven down out of control.

* * *

RE SEC. LT. MARK DENHAM DRAPER, deceased. Pursuant to the Law of Property Amendment Act, 1859, Notice is hereby given that all Creditors and other persons having any claims or demands against the Estate of Mark Denham Draper (sometimes called Marcus Draper) late of The Rectory, Adel, near Leeds, in the County of York, a Second Lieutenant in the Royal Flying Corps and previously a Theatrical Manager deceased (who died on the 7th day of February, 1917, Intestate and to whose Estate Letters of Administration were granted out of the Wakefield District Registry of the Probate Division of His Majesty's High Court of Justice to The Revd. William Henry Draper, the Father of the deceased, of The Rectory, Adel aforesaid, on the 27th day of August, 1917) are hereby required to send the particulars in writing, of their claims or demands to us, the undersigned Solicitors for the said Intestate on or before the 13th day of October, 1917, after which date the said Administrator will proceed to distribute the assets of the said deceased amongst the persons entitled thereto, having regard only to the claims and demands of which he shall then have had notice, and he will not be liable for the assets of the said deceased or any part thereof so distributed to any person or persons of whose claims or demands he shall not then have had notice.

Dated this 28th day of August, 1917.

NELSON EDDISONS & LUPTON, 34, Albion Street, Leeds, Solicitors for the said Administrator.

FRANCE.

OFFICIAL COMMUNIQUÉS.

SEPT. 1st.—On the Aisne front we attacked at 7 p.m. yesterday the enemy position north-west of Hurtebise.

Our aircraft took part in the attack, keeping at a height varying from 100 to 600 metres (330 to 1,980 ft.), and bombarding the enemy with machine-guns in his trenches and at his batteries. All our machines returned.

ARMY OF THE ORIENT.—An enemy aeroplane was obliged to descend near Lake Doiran.

SEPT. 2nd.—Two German aeroplanes were brought down by the fire of our anti-aircraft guns on August 21st and 22nd respectively in circumstances of particular difficulty. The first machine was struck at a height of 2,000 metres (6,600 ft.) by a shell from a motor-gun belonging to the 42nd Section, and came down between Bouçonville and the front lines. The second which was flying over our lines at a height of more than 5,000 metres (16,500 ft.), was struck by a bursting shell fired by Post No. 48 and came crashing to the ground some kilometres from Souilly.

SEPT. 3rd.—German aeroplanes dropped bombs on Dunkirk and Belfort. At Dunkirk several civilians were killed or wounded.

* * *

Julian Cornell Biddle, pilot, Escadrille Lafayette, French Flying Corps, who was killed in a flying accident in France on August 18th, was 27 years of age. He was the younger son of Mrs. Arthur Biddle, of Philadelphia, U.S.A., and a graduate of Yale University, Class of 1912.

GERMANY.

OFFICIAL COMMUNIQUÉS.

AUGUST 28th.—In the afternoon the most intense drumfire began in the battle zone between Langemarck and the Roulers-Ypres railway. With the use of numerous Tanks and aeroplanes flying at a low altitude, the English infantry soon after advanced to the attack on this front.

During the last few days Lt. Voss has gained his 38th aerial victory.

SEPT. 2nd.—Baron von Richthofen yesterday achieved his 60th aerial victory.

* * *

The Exchange Telegraph Company's special correspondent at Lausanne says: The "Basler Nachrichten" of August 28th states that French aviators are making persistent raids upon Rhine military bases and bridges. Each night flying men drop a large quantity of bombs, and in some cases the damage done has been very extensive. One of the Rhine bridges at Mannheim was blown up recently.

RUSSIA.

OFFICIAL COMMUNIQUÉS.

AUGUST 31st.—BALTIC SEA.—During the past week the enemy has shown an increased activity in the Baltic Sea. About 40 enemy bomb-carriers and battleplanes carried out a series of raids on various islands in the Gulf of Riga and in the entrance to the Gulf of Finland, dropping about 90 bombs on the ships of the Fleet and on harbour works.

Our naval aviators had a series of aerial engagements with the enemy, in the course of which we suffered no loss or damage.

SEPT. 1st.—On August 29th Captain Kozakoff brought down his 16th enemy aeroplane, which fell in the region of Pruskurov. The German aviators were killed.

SEPT. 2nd.—In the region of Dvinsk Ensign Efimoff brought down a German aeroplane, which fell into our lines. The German aviators were taken prisoners.

In the region of Brody one of our machines, with the aviator Lieut. Ludnovski, was engaged in an aerial battle with an enemy battleplane. Both machines fell in the enemy lines.

* * *

A Petrograd dispatch by "Agence Radio" to the "New York American," dated August 14th, says: "High up in the air in an observation balloon Kaiser Wilhelm witnessed the victorious advance of the Austro-German forces on the occasion of his recent visit to the Galician front, and saw the Teutonic forces successfully effect a crossing of the Sereth

AUSTRIA.

OFFICIAL COMMUNIQUÉS.

AUGUST 29th.—Trieste has again been bombed by enemy aviators, but no damage worth mentioning was done.

AUGUST 30th.—For the third time during the past 48 hours Trieste has been bombed by enemy aviators Several civilians fell victims to their bombs, and several private buildings have been damaged.

SEPT. 1st.—Trieste has again been the objective of Italian aviators, and the episcopal palace has been damaged.

SEPT. 2nd.—The open town of Trieste was again visited yesterday by Italian aviators, who dropped 70 bombs altogether.

SEPT. 3rd.—Italian aviators dropped bombs on several towns on the west coast of Istria. An enemy air squadron making for Trieste was driven back by our naval planes before it reached its objective.

ITALY.

OFFICIAL COMMUNIQUÉS.

AUGUST 28th.—Unfavourable atmospheric conditions have greatly impeded the activity of our aeroplanes.

AUGUST 30th.—Our aircraft successfully renewed the bombardment of the enemy batteries in the Panovizza wood (east of Gorizia).

AUGUST 30th.—Altogether 246 aeroplanes participated in the battle (on the heights East of Gorizia). A squadron of 40 Caproni machines, which took part in the action to the east of Gorizia, dropped over 7,000 kilogrammes (about seven tons) of projectiles on enemy batteries in the Panovizza Wood (about one mile from Gorizia and extending eastwards about 1½ miles).

AUGUST 31st.—Regardless of the violent anti-aircraft fire, our aeroplanes successfully bombarded the railway establishments of the Tolmino (Upper Isonzo) area and the communication lines on the Carso.

SEPT. 1st.—One of our flights bombarded the railway establishments at Grahovo (Tolmino) with three and a half tons of bombs.

SEPT. 2nd.—Our aeroplanes effectively bombarded the reverse of the enemy positions on Mt. San Gabriele.

Above Belluno an enemy machine was brought down in an air fight.

* * *

A "Morning Post" correspondent's dispatch, published on Sept. 1st, says:

One of the surprises of the Italian offensive has been the conspicuous success of the Air Service. The mastery of the air seems to have passed on that front into the undisputed possession of the Italians. Alike on the Bainsizza Plateau and on the Carso they have become in a novel and extraordinary way the cavalry of the air, and I am told by an authority on the Italian Air Service that a very considerable proportion of the Austrian casualties in both sectors have been the result of the admirable and daring work of the Italian aviators, who have swooped down incredibly low over the retreating Austrians and raked them with machine-gun fire. The same authority tells me that there have been times when as many as 281 Italian aeroplanes have been operating in one engagement, and that, notwithstanding enemy statements to the contrary, only two Italian aeroplanes have been driven down in this offensive, one within their own lines.

TURKEY.

Official Communiqués.

August 26th.—In the course of the operations our aircraft carried out successful attacks, dropping 450 kilos (9 cwt.) of bombs on the enemy.

August 31st.—Our aircraft dropped bombs on the enemy cavalry. There was no event of importance on the other fronts.

Sept. 1st.—On the Caucasus front there was enemy aerial activity.

During the day of August 31st enemy aerial activity increased.

On the night of Aug. 29th enemy aircraft again attacked Smyrna, with the result that four persons were killed, two wounded, and several houses destroyed.

BULGARIA.

Official Communiqué.

Sept. 2nd.—An enemy aeroplane was brought down by our anti-aircraft fire near Demir-Hissar, and fell behind the British lines.

RUMANIA.

Official Communiqués.

August 28th.—In the neighbourhood of the villages of Ivancea, Bratu, and St. George Russian machine-guns brought down a seaplane, which fell in flames in the enemy lines.

August 29th.—On August 13th one of our aeroplanes attacked three enemy aeroplanes, one of which was brought down, and fell behind the enemy lines in the Putna Valley.

DENMARK.

A report from Copenhagen states that a wrecked airship, the nationality of which is not known, passed across the southern part of Jutland on August 30th, coming from the North Sea, and disappeared over the Cattegat. Several steel ropes, to which were attached iron hooks, were dragging behind the airship, which was so low that they tore down telegraph wires, trees, and the roofs of houses, and killed and injured many domestic animals. Great damage was done at several places. A man was observed to be in the car.

Another account states that the derelict was a kite-balloon.

HOLLAND.

A message from The Hague, dated August 28th, states that the German Government and the Commander-in-Chief have expressed regret for the "deplorable incident" of August 18th "which fortunately was not accompanied by any victims," when two German aeroplanes dropped nine bombs on Goeree, Renesse, and Zerikzee (south-west Holland).

They point out that the aviators, who were above the clouds, believed themselves to be still over the sea. The German Government has agreed to pay compensation for the material damage caused by the bombs dropped.

* * *

The Amsterdam "Telegraaf" learns from Emmen that a German biplane while making a trial flight landed on August 28th at Valthermonde. The two occupants will probably be interned.

SWEDEN.

Lieut. Sandström, a well-known Swedish aviator, was killed near Malmö on Sept. 1st.

AUSTRALIA.

A dispatch received by the High Commissioner for Australia on August 29th from Mr. C. E. W. Bean, official Press Correspondent with the Australian Imperial Force in France, says :—

When Australia had on the Western Front no Flying Corps of her own, a large contingent from the Australian Imperial Force was permitted to enter the Royal Flying Corps. A number of Australians had also joined the Royal Flying Corps direct. The result is that there are two bodies of Australian fliers now in France—a large number scattered through the squadrons of the Royal Flying Corps, many of whom have been flying for some time, and those squadrons of the Australian Flying Corps which are now on the Western Front. The work of the Australian Flying Corps will always be easy to identify for their country's history; but the deeds of Australians in the Royal Flying Corps will be most difficult to collect and record.

One of the first Australian aviators whose work came to the ears of the Australian Forces when they arrived in France was a young officer of the Royal Flying Corps in the Ypres salient. It was in the early days of the Somme offensive, shortly after the British had made their first successful raid on the German sausage balloons. In one of these raids opposite Ypres the aviator approached a German balloon which was being drawn down under such a barrage of shrapnel that it seemed impossible to get near it. By the time he was over it it was within three hundred feet of the ground. In the midst of the barrage he pretended that one of the shells had hit him, and came side-slipping down towards the earth. The anti-aircraft gunners stopped at once, as did everyone else, to see him fall. As he came down close to the balloon he righted his machine, fired into the balloon, and brought it down burning, and got clear away before the Germans had time to realise what he had done. The same trick has been played often enough since—he watched a German do it near Bapaume. But that was the first time we heard of it. The man who did it, and who was decorated for it, was a Victorian.

There was one of whom Australians perhaps have never heard, who came out of the Australian Force into the Royal Flying Corps, and left a grand name amongst those who knew him—Capt. Shepherd, D.S.O., M.C. No story of him was finer than that of his last fight. On returning from leave he heard that his best friend had "gone West," as they say, three days before. His friends tried to dissuade him from doing anything rash, but the next day, when he was out leading three other planes, twelve Germans appeared, and he drove straight into the thick of them. It was a wild fight, but they got him, and the Army lost a magnificent aviator. Another Australian soldier whose name ought to live in the annals of flying was Sec. Lt. Wilfred Graham Salmon, who, as the merest novice, went by himself straight into the heart of the twenty odd huge German planes which raided London last June, and who, when hit, managed to guide his machine to within a few hundred yards of his aerodrome before the brave effort ended and he crashed.

U.S.A.

A message from New York, dated Sept. 1st, states that the special correspondent of the Associated Press at the American Field Headquarters in France has telegraphed that one of the most valuable aids the French are giving just now is in lending to the Americans scores of hundreds of their German prisoners, the largest number of whom are rather strenuously engaged in preparing a remarkable American aviation camp, where cantonments will be erected to accommodate 15,000 student fliers, the aviation field itself being several miles square, probably the largest in the entire European war zone.

Scores of American aviators now studying with the French wear French uniforms, and will join the French Flying Service, from which they may later be remobilised into the American Army as may be needed when the Americans take their place in the line. The French are delighted with the aptness of their American pupils, who seem to have a natural taste for flying.

AIR CURRENTS.

The following yarn of a local branch-line seems to illustrate the peculiar ideas held by some people regarding hostile aircraft. A passenger on a local train was much disturbed by an aeroplane which followed the train and circled above it at each halt. Presently the whole train was agog with excitement, including guard and driver. At a certain station the station-master was summoned, and a pow-wow took place, which resulted in the train being side-tracked for an hour. And the joy of the whole case is that this was done because the finding of the pow-wow was that it was a hostile aircraft which was using the train as a guide to London.

* * * *

One hears of joy-riding amongst pilots in training. Here are two choice examples. At a Midland resort, those enjoying a hot day on the river were surprised by the descent of a biplane in a field of no great size bordering the water. There alighted pilot and passenger, who disported themselves in a boat until satisfied, and then started up, got out of the field somehow without hitting anything and disappeared towards their aerodrome.

In another case a pilot coolly brought his machine down in a very lumpy field near a station, took on board a passenger, restarted with the help of local porters, and went off for a joy-ride quite unconcerned.

* * * *

It is said that when the Boche raided a certain aerodrome, a pilot on a fast, new machine drove them off by performing the most alarming stunts all round them, quite regardless of the fact that that pilot's sole offensive implement was an automatic pistol warranted to jam in five rounds.

* * * *

Great are the stories told of one inspection department by another, but surely that related of an A.I.D. man who was found measuring rubber pipe with a micrometer is the best.

* * * *

Near a certain French aerodrome there used to be a very pleasant chateau where a hospitable family received a pilot, be he half-fledged or an "ace," with truly Gallic warmth. Presently the powers-that-be began to notice that the air round this chateau had a most peculiar effect on engines, as machine after machine had to land thereabouts until mechanics summoned from the sheds could effect repairs. Not believing that the air was as deadly as stated, the French equivalent of our A.P.M. took the matter in hand, with the result that a number of sportsmen found themselves under "detention."

"The A.G.S. Book"

By BERNARD ISAAC.
130 Pages. Over 230 Illustrations.

AN IMPORTANT WORK of REFERENCE FOR THE AIRCRAFT INDUSTRY AND THE AIR SERVICES.

CONTENTS.

CHARTS of A.G.S. Rafwires, Tie Rods and Joints, Nuts, Bolts, etc., covering extracts from 82 blue prints—Metric Equivalent Charts—Numerical List of A.G.S. Parts — Alphabetical List of A.G.S. Parts—A.G.S. and other Screw Thread Systems—A.G.S. Standard for Bolt Heads and Nuts — Photographs, Drawings and Dimensions of all important A.G.S. Parts—A.G.S. Fits and Limits — Test Pieces — Articles on "Standardization of Aircraft Parts" and "Accelerating Aircraft Output"—Chart of Admiralty Strainers—Illustrations of R.A.F. and other Aircraft Parts, etc., etc., etc.

THE "A.G.S. BOOK" is issued to **approved applications** rom the Air Services and the Aircraft Industry. Persons connected with the Aircraft Industry should make application through their firms. Applications from the Air Services should be made through the Commanding Officer. One copy is supplied **free** to each firm, and additional copies may be obtained at 2/6 each, the whole of the proceeds, without deduction, being given to The Royal Aero Club Flying Services Fund.

APPLICATIONS must be made on the special forms which may be had from The Aircraft Supplies Co., Ltd., 166, PICCADILLY, LONDON, W.1.

'ASCOL" SERVICE MEANS INCREASED OUTPUT!

At a certain station of peaceable disposition, there arrived one day a fighting machine, sent there that one of its numerous gadgets might be tested.

Naturally, the said machine was equipped with its full lethal weapons, which, equally naturally, the men of the said station knew nothing about. Having, however, a wholesome idea that machine-guns should be reverenced, and not knowing how to unload, the gun was rendered "harmless" by building a neat wooden fence all round those parts of it that seemed capable of mischief.

* * * *

Which is not unlike the policeman of early motoring days who found an abandoned car and tethered it with a rope.

* * * *

It is wonderful that, after many years, the British public will insist on calling all Boche machines Taubes, or rather "Torbers" and "Tawbs," to take their pronunciation, and after all our stately weeklies have explained aeroplanes to all concerned with great care and repeated vim.

* * * *

Funnily enough, not only the B.P. but also a large majority of soldiermen "over there" use the obsolete description.

* * * *

One French school-plane is embellished with the old familiar railway notice, "Defense de se pencher au dehors." Advice very readily taken by the aspirant to aerial honours.

* * * *

A friend writes:—"I was going into a shop with another fellow, who was wearing the observer's badge, and two little urchins looked hard at us. The first remarked: 'Say, Bert, what's one of them blokes got one wing for and the other two?' 'Don't know,' says the other urchin. 'S'pose it's 'cos one flies on a monoplane and the other 'as a biplane.' "

* * * *

Some people look at things quaintly. One of the R.N.A.S. pilots out in the East wrote home and told his mater he hoped to be coming home shortly. She promptly replied as follows: "I do not think you would do any better by coming home, as you would only have to fight. There are such a lot of accidents in the Flying Corps in France." And this to a chap who has been chasing Huns over snow-covered mountains and thousand-foot precipices for a year or so.

* * * *

A petition to the Government is being signed asking that coloured captive balloons should be flown over London when there is little likelihood of an air raid. It is suggested that when a raid is expected the balloons should be hauled down a few minutes before the bomb signals, as an additional warning. The balloons would carry a coloured light at night, and special constables would have small button-hole electric lamps, showing red for danger and green for "all clear."

Copies of the petition can be had from the Organiser of A.S. Captive Balloons, 9, Stone Buildings, Lincoln's Inn, W.C.2.

Surely "ASS. Captive Balloons" would be a better address.

AN INTERESTING SOUVENIR.

People who are interested in Zeppelin souvenirs will like the picture book concerning Zeppelin L.48, brought down in East Anglia on June 17th. Mr. J. S. Waddell, of the Hayling Studio, Leiston, Suffolk, is responsible for its production, and very well he has done it. It contains 24 very well-produced photographs of the Zeppelin, and of various incidents in connection with it, including a photograph of the funeral of the crew, in which the Commanding Officer's coffin is shown, bearing a wreath sent by the R.F.C.—an act of courtesy which will be appreciated by soldiers of all nations, though it may perhaps meet with the disapprobation of ultra-patriotic civilians.

The photographs of the wreckage and its surroundings are of much interest, and show the machine to have been of the standard type, which is practically a cross between a Zeppelin and the Schutte-Lanz. The pictorial souvenir can be obtained post free from Mr. Waddell for 1s. 3d., and Mr. Waddell also publishes an excellent series of picture postcards in connection with the same air fight.

UNNECESSARY ALARM.

At Bow Street Police Court on August 31st, Walter Edward Griffin, of Old North Street, Theobald's Road, was charged before Mr. Garrett with contravening the Defence of the Realm Regulations by spreading by word of mouth a false report to the effect that an air raid was taking place.

Police-sergeant Goldie said that on the night of August 16th he was on duty at 10.30, when the searchlights and anti-aircraft guns began exercising. He saw the defendant leave his own house, Old North Street, and run to and knock at the doors of several other houses, at the same time shouting at the top of his voice: "Come on! The Germans are here! That noise is not guns—it's bombs. Come on down to the Tube." As a result of the defendant's action a number of women ran from their houses half-dressed and children were dragged from their beds. Witness went up to the defendant and told him there was no raid in progress—that it was only practice—but defendant continued to shout "There's a raid!" and went away in the direction of the Underground railway station, followed by a crowd of frightened women and children. Another police officer gave corroborative evidence.

The defendant denied knocking at any doors or creating any disturbance. Mr. Garrett said he was satisfied the defendant had behaved in a manner to cause unnecessary alarm, and ordered him to pay a fine of 40s.

THE HANDLEY PAGE ATHLETIC CLUB.

A very large gathering was present at the Avenue Grounds, Cricklewood Lane, on Saturday (August 25th) to witness the first annual sports' meeting held in connection with the Handley Page Athletic and Social Club, and favoured with ideal weather.

The arrangements were successfully carried out by Mr. W. H. Jones (the chief inspector at Handley Page's, Cricklewood), and the stewards. Amongst the spectators were a number of convalescent wounded soldiers, who had been invited to honour the occasion.

During the afternoon a capital selection of music was given by the Child's Hill Excelsior Silver Prize Band.

A long programme had been arranged, and there were approximately 200 entries for the various events. The races included a generous number of open events, which were confined to aircraft workers in the Hendon and Cricklewood districts, and in these, as also in the club events, there was some keen running. The final results were as appended:—

Boys' 100 Yards' Race.—1st, I. Derry (1½ yds.); 2nd, R. Weston (2 yds.); 3rd, E. Philpot (scratch). Time, 13 4/5th secs.

Men's 100 Yards' Handicap.—1st, J. Hicks (scratch); 2nd, A. Nicholls (4½ yds.); 3rd, H. Bond (3 yds.). Time, 10 3/5th secs.

Ladies' 60 Yards' Flat Race (open).—1st, Miss Cheese; 2nd, Miss Slade; 3rd, Miss Wallis.

Men's 220 Yards' Handicap.—1st, J. Hicks (scratch); 2nd, W. Coldred (8 yds.); 3rd, H. Bond (5 yds.).

Ladies' 60 Yards' Slow Cycle Race (open).—1st, Miss English (Handley Page); 2nd, Miss Heading (Integral Propeller Co.); 3rd, Miss Didman (Handley Page).

Men's 440 Yards' Handicap.—1st, J. Hook (10 yds.); 2nd, G. Mackerell (15 yds.); 3rd, G. Brautigan (15 yds.)—a very close finish between 1st and 2nd. Time, 59 secs.

Ladies' Thread-Needle Race.—1st, Miss Banks and Mr. Martin; 2nd, Miss English and Mr. G. Ensor; 3rd, Miss Cooper and Mr. Weston.

One Mile Scratch Race.—1st, J. Hook; 2nd, W. H. Green; 3rd, A. Phillips.

Tug-of-War.—1st, Dept. 20 (Messrs. G. Ensor, F. Warren, B. England, W. Briars, F. Hill, S. Brazier, G. Sharp and E. Troll—coach, H. A. Warwick); 2nd, Dept. 3.

Gent's Slow Cycle Race.—1st, S. Mayo; 2nd, Frost; 3rd, H. Smith.

100 Yards' Open Handicap.—1st, G. Chater (Smith and Son), 5 yds.; 2nd, J. Hicks (Handley Page), scratch; 3rd, H. Edwards (Grahame-White), 4 yds.

100 Yards' Veterans' Race.—1st, J. Phillips (42 years); 2nd, C. Bleamey (49); 3rd, A. Hardiman (42).

Men's Sack Race.—1st, A. Nicholls; 2nd, A. Crittenden; 3rd, C. Balfour.

440 Yards' Open Handicap.—1st, H. Edwards (Grahame-White), 10 yds.; 2nd, E. S. Deadman (Aircraft Manufacturing Co.), 15 yds.; 3rd, E. J. Powell (Integral Propeller Co.), 10 yds. Winner's time, 57 2/5th secs.

Men's Costume Race.—1st, L. Hogan; 2nd, W. Vono; 3rd, C. Balfour.

Ladies' 60 Yards' Flat Race (confined to works).—1st, Miss Cheese; 2nd, Miss Slade; 3rd, Miss Smith and Miss Calcott (dead heat).

Ladies' Slow Cycle Race (confined to works).—1st, Miss English—the only competitor to reach the tape.

Ladies' Sack Race.—1st, Miss Thomas; 2nd, Miss Robinson; 3rd, Miss Cheese. Miss Cheese, who was first in her heat, unfortunately fell when leading at about three yards from the tape.

One Mile Relay Race.—The Grahame-White Athletic Club entered two teams, as did also the Smith and Sons' A.C.; whilst the Handley Page and Aircraft Manufacturing Co. A.C.'s entered one each. The Grahame-White teams, consisting of Messrs. Edwards, Crabtree, Cohen and Johnson, won in the remarkably good time of 3 minutes 55 seconds. Handley Page came in a good second with Messrs. Bond, Hicks, Hook and Chopping. Aircraft Manufacturing came in third.

The Prizes.

The prizes were presented by Handley Page, Ltd. They were distributed by Mr. F. Handley Page, who was formally introduced by Mr. W. H. Jones. At the conclusion, Mr. Handley Page expressed his pleasure at performing the task, and remarked that he was glad to see so many present. They were also pleased to see the soldiers who had been trying to win, and eventually would win, that other great race.

WHAT WAS THE CENSOR DOING?

The "Times" of August 22nd says:—

Although no official warning was given by means of sound signals in London yesterday, a few minutes after the preliminary notice had been given to police-stations and ambulance corps the news of the raid on the coast spread through the East End and so to the West.

At Hampstead many householders, especially those with children, made for the safety of the Underground Railways. They descended by the lifts, having bought 1d. tickets for the privilege, and stayed in disconsolate groups on the platforms for upwards of an hour.

At all the stations there were similar groups of refugees, and at Camden Town and Warren Street they were particularly large. There was a run on the Metropolitan trains from the East End and an exodus began towards Charing Cross, lasting until long after the all-clear signal had been given.

It would assist the authorities very much if people would refrain from crowding such places before any warning has been issued. There were instances where it was difficult for passengers to get to the trains and the trains themselves were very crowded. The crypt at St. Paul's Cathedral was packed with people.

[This is certainly a nice picture for circulation abroad. If Londoners under prospect of enemy fire behave like that, we must seem a pretty poor sort of Ally. One is surprised that any censor should have passed the paragraph, as it will certainly afford joy to all good Germans, and prove mightily encouraging to those who organise and carry out the raids. The "Times" might at least have told the rest of the truth, which is that for one "refugee" running vainly for cover, there were a hundred gazing casually at the sky to see if there was any sign of a raid, and a thousand going on with their work unconcernedly, merely ready to take cover if a proper alarm was given.—Ed.]

THE BIRD.

(With Apologies to Mr. Kipling.)

If you maintained your faith when all around you
  Condemned the Air and labelled you a Fool;
And persevered until the application
  Of hard, cold facts bore fruit with those who rule.
If you have learned to hear the Truth you've spoken,
  "Noted," "Referred," and passed on to the files,
And known sound words of those who saw the future
  Derided with polite official smiles.
If you have learned the strawless brick to fashion,
  In spite of those who did withhold the straw,
And waited till the blast of silent envy
  Did fan the flame of ridicule the more.
If you have seen the thing that you've created
  (Your recompense of weary months of toil),
Given to those who wait till odds are even,
  Then cluster round to gather up the spoil.
If you have watched from at the central zero
  The mounting list of those who now believe,
I'll bet the world, and all that there is in it,
  You wear a golden bird upon your sleeve!

A SERVICE MACHINE IN THE BREAKING.

By P. B. O.

(Reproduced from "The Wing Tip," the unofficial organ of the R.N.A.S. in Flanders.)

As in other professions and callings, writes "Air Pilot" in the "Daily Wail," there is a certain type of youth who invariably makes a good crasher; this is the supersaturated boy.

The crasher has, in the usual way, been closely associated with sports and manly games in Timbuctoo and the surrounding provinces—this gives him initiative and resource and teaches him to remain calm and cool-headed in all situations, however strange and unpleasant they may be. All these qualifications are necessary to make a man a successful "grass-punisher."

He must have good eyesight, or else he might mistake a roof-top for a haystack or a croquet lawn for a cornfield, and entail heavy damages to a long-suffering Government. For preference he should be between the ages of 16 and 74.

The life of a "wrecker"—that is to say his flying life—varies from five minutes to five months—never more! The great strain on the nerves, although not always at the first effort, begins to make itself felt after he has done three or four really good somersaults on, say, a Nieuport; he then finds that he is no longer so keen on going up as he was, that it takes a glass or so of Horlick's Malted Milk, without soda, to warm his feet and enable him to face the music and again to perform that combined vol-plane and nose-dive so much appreciated by the majority of C.O.'s.

The aspirant to flying honours must be neither too tall nor too short; if the former, he will probably find himself with his feet through the petrol tank and his head through the top plane; while if the latter, he may spoil his personal beauty (peut-être) by violent contact with the instruments or mirror, entailing much scraping and stitching by our friend the Doc.

His weight, for preference, should be on the lighter side, as the machine already possesses sufficient weight to make a really respectable mess of itself, so that an additional 14 or 20 stone will only cause it to spoil the ground for any future operations.

His stomach should be strong: a good sailor has usually about nine lives, and crawls out of the wreckage with a smile of hope—sailors don't care!

Before taking up a machine attention should be paid to the surrounding country: if it is quiet farming land with plenty of trees, barns, and haystacks, it is to be recommended that he tries skimming a haystack or banking round a good solid oak—his machine will then be beyond repair; while if on the sea coast he might try tail-sliding from 5,000 feet into a choppy sea or pancaking on wet sand—both give excellent results.

Finally, he must be hardened to rough words and glances of hate.

AN AERIAL ALPHABET.

A is the airman who looped the Hunguffin*
  For is please read was, he is now in his cuffin.

B is the batman who dirties our quarter,
  Ruins our boots and forgets our hot water.

C is the castor the rotaries use.
  It bucks up both engines and humans,—excuse.

D is for drift, if you land with it on,
  You will, almost at once, realise you were wrong.

E is the engine which causes the motion,
  Which gives you the lift (not caused by promotion).

F is the fairy you love with a pash,
  She is sure to be there on the day that you crash.

G is the gas which makes things go roun',
  And sometimes does not, in which case you come down.

H is the hangar one greets with such smiles,
  On return from a recco of ninety odd miles.

I is the incidence put on each plane,
  From which you get lift I need hardly explain.

J is the joy-stick—I mean control lever,
  Which the Hun† always clings to, as if in a fever.

K is keel surface, it stops you from spinning.
  Perhaps, if you know when the spin is beginning.

L is the loop you're intending to do,
  If the wind will go down and the sky get quite blue.

M is the man who keeps crashing on landing.
  Why he won't flatten out passes all understanding.

N's the nacelle of a fast pusher scout,
  Twixt you and the earth, if you crash, there is nought.

O is hot oil, once it gets in your eyes,
  You will surely wear goggles at last and be wise

P is the prop which makes sticks which are sold,
  It has other uses as well I am told.

Q is the Quirk,‡ a machine of stability,
  Of peculiar design, but unbounded utility.

R is for R.A.F., who've designed a machine
  And an engine as well, such as never was seen.

S is for stunting, if done near the ground
  It's stupid and silly and grossly unsound.

T is the tarmac I stand on all day,
  And hope for a chair in an optimist's way.

U is the union of pipe and of tank,
  When the union gave way then the aeroplane sank.

V is for Vickers' gun, gruesome affair,
  Used to put wind up the Hun in the air.

W is washout, and wash-in as well,
  Their meaning's a secret I hardly dare tell.

X is the pilot, whose glory and fame
  We'll remember in England, though we don't know his name.

Y is the yell of a man (or its echo),
  Whose engine's gone dud for a long-distance recco.

Z is a letter of letters, my friend,
  It involves the word Zeppelin (this is the end).

* A term used to describe the B.E.2b.

† A term of endearment applied to all pupils under instruction in aviation.

‡ A term used to describe the B.E.2c.

The AEROPLANE

The Editorial and Advertising Offices of "The Aeroplane" are at 166, Piccadilly, London, W.1.
Telegraphic Address: "Aileron, London." Telephone: Mayfair, 5407.
Accounts, and all correspondence relating thereto, should be sent to the Registered Offices of The Aeroplane and General Publishing Co., Ltd., Rolls-House, Breams Buildings, E.C.4.

Subscription Rates, post free: Home, 3 months, 3s. 10d. 6 months, 7s. 7d.; 12 months, 15s. 2d.
Abroad, 3 months, 4s. 4d.; 6 months, 8s. 8d.; 12 months, 17s. 4d.

ON MR. LANCHESTER AND HIS FRIENDS.

A PRELIMINARY SKIRMISH.

Some two or three weeks ago I promised to give myself the pleasure of replying to an attack on me and on this paper which appeared under the name of Mr. F. W. Lanchester. His article was prefaced by an editorial attack in the same paper, and, as Mr. Hilaire Belloc has been closely associated with the paper in question, I assumed at the time that the editorial attack was written by him. I find, however, on closer inspection that Mr. Belloc's name does not appear, so that perhaps he was not the author, therefore it must suffice to refer to Mr. Lanchester's advanced skirmishing line merely as the editor.

However, it seems that in the editorial view I have committed the deadly journalistic sin of having written two articles on the same subject—namely, the supply of aircraft, which articles appeared on the same Sunday, July 29th, one in *The Sunday Times* and one in *The Observer*. Not being a journalist myself, I confess to being unimpressed by the enormity of the crime, though it may be sufficiently irritating to a professional journalist who has failed to make good to find a mere amateur occupying the honourable columns of two leading papers on the same day. By way of consoling himself, presumably, this amusing editor says, "The only feasible explanation of the coincidence is that the editor of *The Observer* and the editor of *The Sunday Times* are both labouring under the same hallucination or delusion—to wit, that Mr. Grey is an expert whose dicta are reliable and trustworthy."

Happily, I have no claim to be considered an "expert," for on the subject of "experts" I entirely agree with General Henderson's famous definition,* consequently the jibe misses its mark. Following this, the editor says, "We have no doubt that the editor of *The Observer* and the editor of *The Sunday Times* acted in good faith, and in pure ignorance of the fact that Mr. Grey, like Mr. Pemberton-Billing and Mr. Joynson-Hicks, is not to be taken seriously."

To Be Taken Seriously.

So far as this last phrase is concerned, Mr. Joynson-Hicks succeeded before the war in convicting the then Secretary of State for War of making absolutely false statements in the House concerning the equipment of the R.F.C. He has since put forward criticisms which have later been proved to be correct. He has been elected chairman of the Parliamentary Air Committee, which is the strongest non-party organisation in the House. And he has been appointed by the Government a member of the Civil Aerial Transport Committee, of which Mr. Lanchester has also been similarly appointed a member, on which official reasoning Mr. Joynson-Hicks and Mr. Lanchester would appear to be equally worthy of being taken seriously—or not, as the case may be.

As regards Mr. Pemberton-Billing, his rôle has been that of the fanatic, whose self-sacrifice is a necessary ingredient in all reform movements, as history shows. But, at any rate, he fought and beat the whole force of the Coalition Government in two elections, and the Party organisers took him very seriously then. He occupied the attention of Cabinet Ministers, political agents, Secret-Service men, and Intelligence Department officials to quite a considerable extent, in the effort to discredit him in the eyes of the public, and the worst thing they could all rake up against him was the entertaining history of his variegated career in South Africa, which they duly published, greatly to his advertisement. And after that, in spite of playing his excellent cards badly through impatience with the political game, he forced the Government to form the Air Enquiry Committee, which, despite its limitations, did much excellent work and confirmed many of the criticisms put forward against the administration of the R.F.C. as it then was. Doubtless the reforms which followed the sittings of the Committee would have come in time, but they were certainly hastened by the agitations of the period. But in any case, one can scarcely argue, under the circumstances, that such a man was, and is, not to be taken seriously.

Lost Opportunities.

It seems, therefore, that this editor person has made a singularly unhappy choice of epithets in using the phrase "not to be taken seriously." There were half a dozen crimes with which he might have charged me more or less in common with the two members of Parliament with whom he has been pleased to associate me, but he has missed all his best chances. However, I am glad to see him admitting that "No editor is infallible, not even the youngest," for he may in future apply the phrase to himself instead of to those experienced publicists, the editors of *The Sunday Times* and *The Observer*.

An opportunity occurs for him to do so in his later remark that "Disraeli once cynically remarked at a Royal Academy banquet that the critics are those who have failed in literature and art." If I am not seriously mistaken, the sentiment was put into the mouth of a character in a novel called "Lothaire" by the author, Benjamin, Lord Beaconsfield. Probably none knew better than the noble lord the falsity of the innuendo,

*"Any plausible rogue gifted with sufficient assurance and aided by a ready pen or supple tongue has been able to pose as an 'aeronautical expert,' and to find some kind of following. To those who, as a matter of duty, or in search of information, have perused the aeronautical discussions carried on in the Press, or the reports of such discussions elsewhere, the very word 'expert' calls up a strange procession of inventors, politicians, motor-trade touts, journalists, trick fliers, novelists, and financial agents, most of them axe in hand on the way to the national grindstone."—(General Henderson's Preface to Mr. Lanchester's book on aeroplanes in war.)

or the truth of the more recent phrase of Mr. Ernest Newman to the effect that Nature can produce genius by the bucketful, but it takes time and experience to make a critic.

An Official Megaphone.

It may be that the editors of *The Observer* and *The Sunday Times* will feel proud of this anonymous editor's tribute that they "do not appeal to the illiterate and uneducated public . . . they appeal to the intelligentzia." Horrid word intelligentzia, and very reminiscent of Mr. Belloc and his would-be intellectual school of minor prophets, but let it pass. Also, a paper which appealed to the illiterate would be rather an interesting production. Anyhow, the trouble of the anonymous one is that the intelligentzia have "a weighty grievance" against these distinguished editors because they permitted me, an "exploded critic" and sundry other things, to criticise our system of aircraft supplies in their columns. Furthermore he asks that they shall allow their readers to hear the other side, according to Mr. Lanchester, "in view of the fact that the tongue of the other side is tied by official rules and regulations!"

In view of the fact that "the other side" pulls all the official strings, can dope the Press into silence when criticism comes too near home, and can use such an effective megaphone as Mr. Lanchester, there seems little need for the plaintive appeal of the anonymous one. However, if "the other side" wishes to reply, either by the hand of Mr. Lanchester or in any other way, the columns of THE AEROPLANE are always at their disposal for the purpose. Personally, I rather regret that, up to the time of writing, neither of the two great Sunday papers has paid any attention to the attack, though one can quite understand their disinclination to trouble about the anonymous editor of a minor journal.

Both Barrels.

The last effort of the unknown one is a double-edged weapon. Under the heading of "The Deadly Parallel" he prints side by side two of my statements as they appeared in each of the Sunday papers. This first is the recognised Service proverb, "We are never less than six months ahead of the enemy in design, and never less than twelve months behind him in deliveries." The wording in each paper is identical, except that in *The Sunday Times* I wrote "our designs" and "our deliveries."

In the second paragraph I said, "R.F.C. pilots were still sent over the German lines on B.E. (officially designed) biplanes with 90-h.p. R.A.F. (officially designed) engines. At the present moment [July 29th, *bien entendu*, but perhaps not now on September 12th] there are 'chaser' squadrons—save the mark!—dying in France on Sopwith single-seaters with 80-h.p. engines. These machines are up against German reconnaissance machines of anything between 160-h.p. and 260-h.p." The parallel paragraph was identical in statement of facts, though the wording was slightly varied.

If there had been any divergence in the statements, the parallel would have been pretty deadly for me, I admit; but as they agree so closely, they appear to me to be rather like the two barrels of a double-barrelled gun in my hands. I can assure those who were so concerned at the time that there was no collusion between these two excellent papers. There seems no reason why the sportsman should let his right barrel know what his left barrel doeth, till they both go off together. The respective, and respected, editors each asked me in the same week for an article on a subject which was at the moment of public interest and was being publicly discussed by a number of people, and they got that for which they asked.

An Unaccustomed Phenomenon.

In any case, I defy the anonymous editor, or any other of Mr. Lanchester's friends, to disprove the facts stated in those deadly parallel columns. I can only suppose that the "deadliness" of the parallel in the eyes of my editorial critic consists in my having used almost identical words in two different papers. I am surprised—or, perhaps, as he is apparently a journalist, I should not be surprised—that he should object to two leading newspapers telling the truth on the same day. I admit that it may be an unaccustomed phenomenon in English journalism, but I cannot see that it is deserving of condemnation, or even of the mild form of semi-private pillorying provided by his journal.

MR. LANCHESTER'S SOLO.

We may now turn to the *pièce de resistance*, or main body of the attack, Mr. Lanchester's great solo, entitled "A Campaign of Slander." I wish it were possible to reproduce the whole of it in these columns, for Mr. Lanchester is always worth reading. Unfortunately he is as voluminous in his writing as I am myself, and there is not room for us both in the same paper at the same time. Therefore I am compelled to quote merely the main points of his argument, though I hope that I shall not omit any point of importance.

A Straight Offer.

It seems well, before proceeding further, to make to Mr. Lanchester this straight offer.—If at any time, now or hereafter, he wishes to attack me or any of my writings, the pages of this paper are entirely at his disposal. I wish to be perfectly fair to any person or any system criticised in this paper, and if Mr. Lanchester desires to write on behalf of the criticised I am prepared to give him these front pages which have been occupied since the foundation of THE AEROPLANE by my personal articles, so that his reply may have precisely the same prominence as my criticisms. Further, I give him my word that I will not exercise any editorial control over anything which he may write, and that I will not make any alteration in or addition to or comment on his writings. Any reply shall appear as a separate article over my own signature. And he shall have proofs of his own pages so that he can edit them himself.

Without any desire to boast about the circulation or influence of this paper, I think I may claim for it that it is more carefully read in the Flying Services and in the Aircraft Industry than any other paper. If not, I take it that people would not care whether I criticised them or not. At any rate, I can offer Mr. Lanchester greater publicity for his views than was afforded to him in the case of his recent attack.

Possibly my criticisms are affected by the fact that I see or hear only one side of the argument. Certainly Mr. Lanchester, judging by his writings, only sees the other side, and as one does not hear of Mr. Lanchester as a frequent visitor at aerodromes or at "trade" aircraft factories, it seems still more likely that his views are one-sided. Therefore, if we both state our views in the same place, our mutual audience is the more likely to arrive at the truth, which, I take it, is what Mr. Lanchester desires as much as I do. I assume that Mr. Lanchester, being a Government Official, as a member of the Government Advisory Committee for Aeronautics and as a member of the Civil Aerial Transport Committee, has no personal or financial interest in any paper, and is therefore at liberty to set forth his views where he wills. However, there is the offer for Mr. Lanchester to take or leave as seems best to him. I can be fairer than that, I shall be glad to know how

"A Few Facts by Mr. Lanchester."

Mr. Lanchester is pleased to call my articles in *The Sunday Times* and *The Observer*, which were composed of statements already familiar to readers of this paper, "a venomous and unrestrained attack on the Air Board and upon the two branches of our Air Service, and upon those directly and indirectly responsible for their control." That is from Mr. Lanchester's point of view. From the other point of view they merely laid out a string of facts demonstrating how sins of the past have had their effect on the present, and where there is room for improvement in the present system. So far from being an attack on the Air Board, they were, on the contrary, calculated to assist the Board by pointing out certain matters which those at the top end of what Lord Sydenham has called "the chain of responsibility" would be unlikely to learn through so many intervening links. Mr. Lanchester would have been nearer the mark in calling them an attack on those who *have been* responsible for the control of the Flying Services in the past.

The Wily Red Herring.

Mr. Lanchester either confuses the issue in his own mind, or purposely endeavours to draw a red herring across the scent, by calling the articles "a renewal of the Billing-cum-Joynson-Hicks-cum-Grey attacks of some twelve months back." There is no reason for dragging Mr. Joynson-Hicks or Mr. Billing into the argument at all. The articles were mine, and no other person had anything to do with them. If some of the criticisms were similar to those expressed by others, they can only have arisen from the same root-cause of complaint. Because Mr. Billing has contrived to make himself unpopular with certain classes of the community, while gaining popularity with others, it may be a good move in controversy to link his name as closely as possible with those of other critics in the hope of discrediting the whole bunch, but if Mr. Lanchester himself wishes to be taken seriously he should be above such political trickery. And, anyhow, why stop at Mr. Billing and Mr. Joynson-Hicks? Why not drag in Lord Montagu and Lord Sydenham, and Mr. Ellis Griffiths and Sir Henry Dalziel, and Colonel Faber and Major Burgoyne, and all the rest of the critics?

When Mr. Billing was fighting the Mile End and the East Herts elections, and was being misrepresented by the Government-inspired Press, I supported him because he deserved support, apart from a very natural sympathy for the under dog, and I have supported him, and other members of Parliament, when their criticisms were well founded. But I have not done so when the criticisms were on the wrong lines, or were not deserved.

Mr. Lanchester refers to "the exposure of Billing" in the *Daily Chronicle*. Does Mr. Lanchester know how the South African history of Mr. Billing was obtained and how it was conveyed to the *Chronicle*? If so, would he like to describe the operations in this paper? He is quite at liberty to do so if he dares. And perhaps he will also specify what there was discreditable in the so-called "exposures." If history does not lie, the youthful adventures of the late Lord Strathcona and of the very present Sir Eric Geddes were among people at least as humble in station and were nearly as variegated.

The Air Enquiry Fallacy.

Mr. Lanchester makes much capital out of the fact that before the Air Enquiry Committee "it soon transpired that neither Billing, Grey, nor even Joynson-Hicks were able to produce evidence in support of their wild and reckless assertions and accusations." Permit me to remind Mr. Lanchester that only plaintiffs or defendants in law "produce evidence." I personally appeared before that Committee simply to indicate directions in which reforms were needed. All those who appeared before the Committee were officially called "witnesses," and witnesses do not produce evidence, they merely state what they know or believe to be true. Even the Committee itself was not empowered to subpœna witnesses, nor to take evidence on oath. Therefore, Mr. Lanchester's jibe about not producing evidence is merely another attempt to sidetrack the issue. Logically his argument is bad, for he is guilty of begging the question. Nevertheless, it is well to point out that the final report of the Committee agreed to an unexpectedly large extent with the criticisms of those who appeared before it.

A Personal Point.

Referring to me personally, Mr. Lanchester says, "He abandoned his charges without offering a tittle of evidence," and quotes from *The Times* report as follows: "Mr. Grey under cross-examination was asked whether he might take it that the charges against the Royal Flying Corps other than those now made by witness were dropped. No answer was given to this question, and the Chairman remarked that the charges did not seem to be persisted in now." *The Times'* report, albeit execrable grammar, is substantially correct as a statement of what occurred. But it may be well to explain that I went there as a witness and not as a prosecutor or plaintiff. I went prepared to answer questions, not to make charges. When challenged by the chairman to make charges, I laid down briefly some general criticisms of the administration of the R.F.C.

Reproduced from "La Guerra," the Italian Official Publication.

OUR ITALIAN ALLIES.—A group of Caudron Biplanes in use at one of the Italian training grounds.

as it then was. After spending so much time before the Committee, and after seeing the lines on which the enquiry was being run, it seemed to me to be useless to waste any more of its time, for it was obvious that no evidence, in the proper sense of the word, could possibly be produced by anyone. So I simply shut up, and left the Committee to draw what conclusions it pleased. But, let Mr. Lanchester and his friends clearly understand that I was not there to make "charges," and did not make any.

There is a vast difference between a charge and a criticism. For instance, I might legitimately criticise Mr. Lanchester's ideas on aero-engine and aeroplane design, as exemplified by his attempts to produce an aero-motor at the Daimler works and a chiefly-steel aeroplane at Bognor, both of which failed to function, but I should never think of charging Mr. Lanchester with deliberately wasting somebody else's money in building that machine and that engine.

Those "Murder Machines."

Referring to Mr. Joynson-Hicks, Mr. Lanchester says, "The resilience of these *soi-disant* reforms [presumably a misprint for reformers] is truly amazing! We find him once more talking of 'murder machines,' a term borrowed from one of the grossest of the Billing charges, and which had received the unreserved condemnation of the Court."—I do wish Mr. Lanchester would avoid split infinitives, inconsequent "and whiches," and unsupported final prepositions. They quite spoil what would otherwise be a very effective style in Philippics.—However, what I was going to say is, Why does he again attempt to link these two Members, and why does he so carefully avoid mentioning that the "murder" epithet, which seems to catch officialdom so badly on the raw, was originated by that excellent old-school Tory, Captain (now Colonel) Walter Faber, M.P., in early 1913? What grounds has Mr. Lanchester for saying that Mr. Joynson-Hicks borrowed it from Mr. Billing rather than from Colonel Faber?

"Ha! Ha!" said he. "A Trap!"

On another point Mr. Lanchester displays unnatural innocence. He says: "There is one fact that shows up prominently when the various attacks and accusations are examined. Their authors (in the present case Mr. C. G. Grey) are wily enough to avoid putting them in a form which would permit of their being challenged in the Courts. The accusations *are never made against individuals* or in such a manner as would enable the parties attacked to bring an action either for civil or criminal libel to establish the truth."

Now in the first place, the majority of my criticisms have not been directed against individuals, but against a system. If the present Air Board, or some future Air Minister, is strong enough to break up the old system and set up an improved one, well, good luck to them, it or him, as the case may be. None will be more ready to support them than I. On the other hand, there have been instances in which I have been "wily enough to avoid" libels, for the very good reason that though, with the ability to *subpœna* witnesses, certain criticisms could have been proved up to the hilt, there is such a trick as shutting up critics by bringing an action for libel and then skilfully deferring the hearing of the case month after month till the reason for the criticism has been abolished, or the interest which made it of importance at the moment has died of old age.

SOME OFFICIAL PRONOUNCEMENTS.

Proceeding further, we find Mr. Lanchester saying, "In the present recrudescence we have C. G. Grey forced to admit the eminence of the Royal Flying Corps, b he represents its position as maintained in the face the enemy in spite of faulty *matériel,* rather than account of our technical mastery. No one, not ev Mr. Grey, will grudge our gallant flying men the meed of honour and appreciation."

Quite so, but why the "not even"? None honou and appreciates the gallantry of our active servi aviators more than I do. Once upon a time I ev dared to write a book about them and their doing However, let us consider the other points, in the lig of official pronouncements, which I take it may be co sidered as evidence, even in a Court of Law.

In the *London Gazette* of December 29th, 1916, a peared the end-of-the-year dispatch from Sir Dougl Haig, dated G.H.Q., December 23rd, in which he said *"I desire to point out, however, that the maintenan of the mastery of the air, which is essential, entails constant and liberal supply of the most up-to-da machines, without which even the most skilful pilo cannot succeed."*

Now General Officers Commanding in Chief do n put striking phrases into their most important di patches purely for fun. If that phrase means anythin at all it implies a warning for the future. And such warning would not be thought necessary unless th experiences of war had shown it to be necessary. I plain language any ordinary man would take it t mean "We have the best pilots in the world, but w must have more and better machines." If it does n mean that we were then holding our position becau of the skill of our pilots, "rather than on account our technical mastery," perhaps Mr. Lanchester wi explain what it does mean.

The Truth from the Treasury Bench.

Next we come to March 7th, when Sir Henry Dalzi asked in the House "whether we still maintain th mastery of the air on the Western Front?" Mr. Ma Pherson, that most honest and straightforward of Mini ters, replied "I think I can give that assurance"— reply which produced exclamations of "Oh! Oh!" fro various parts of the House.

On March 21st—just on three months after Sir Dou las Haig's dispatch was written—Sir Henry Dalzi asked the same question again. This time Mr. Ma Pherson replied, "The situation is similar to that whic obtained at the same period of last year, when at th time the Germans, reinforced and rested during the wi ter, put up a serious opposition."

Those who remember what things were like on th West Front early in 1916 and late in 1915, will realis what such an official admission meant. At the ver best it meant that Sir Douglas Haig was not then o taining his requirements, which would have made th mastery in the air possible. Which seems to justi the criticisms and to condemn the administration whic was responsible for such a state of affairs.

Then we come to the Easter period when 28 Britis machines were officially logged as "missing" on Apr 7th, and 49 were officially admitted to be "missing between April 3rd and April 9th inclusive, witho counting those shot down on our side of the lines, crashed on returning.

Though not an official pronouncement it is wor while quoting "C. W.," of *The Observer,* who wro on April 8th, "There is a widespread conviction th the Air Ministry has not even yet succeeded in puttin on a proper basis the manufacture and delivery of th fastest and highest climbing aeroplanes, and that th old evil of preference for Government-designed machin and engines still exists." He referred also to "u

businesslike and wasteful contracts," and to "aeroplanes of proved inferiority being made in large numbers." And he wound up by saying, "All these questions demand an immediate answer, or the present authorities will wake up one morning to find that an impartial investigation is being conducted over their heads." I do not know who "C. W." may be, but he nearly always writes sense, and never more so than in that article.

Only a few days previously, on April 4th, Mr. Winston Churchill, speaking on the Air Board and the situation generally, blamed the House of Commons "for relaxing its vigilance and for being so easily put off." "Never since the battle of the Marne," said he, "has the situation been more serious than at present." These were unofficial dicta, but they did not draw down the wrath of Mr. Lanchester and his friends as my two articles did. Why?

An Illuminating Admission.

Proceeding, we come to April 25th, when Major Baird, Parliamentary Secretary to the Air Board, and therefore presumably in possession of the facts, admitted in the House that *B.E.2cs, B.E.2ds,* and *B.E.2es* were still used over the enemy's lines. The following day, April 26th, Major Baird, right at the beginning of his long speech, referred again to the various B.E. types, and said, *"I do not deny that if they* [C.Os. on active service] *had other machines they would send them out in preference."*

Now that was precisely the state of affairs against which all my criticisms have been directed ever since the war began. We might have had "other machines," but for the very system and the very people which and whom Mr. Lanchester is so concerned to defend. The fact that so many sudden and violent changes in the personnel of the production departments occurred in or about or after that period surely shows that the criticisms were well directed and justified.

In the three months between that date and the writing of the offending articles in the Sunday papers a great deal has been done to improve matters in many directions. Mistakes have also been made, and mistakes seem to be legitimate grounds for criticism. But when possible that criticism has been of a purely friendly nature.

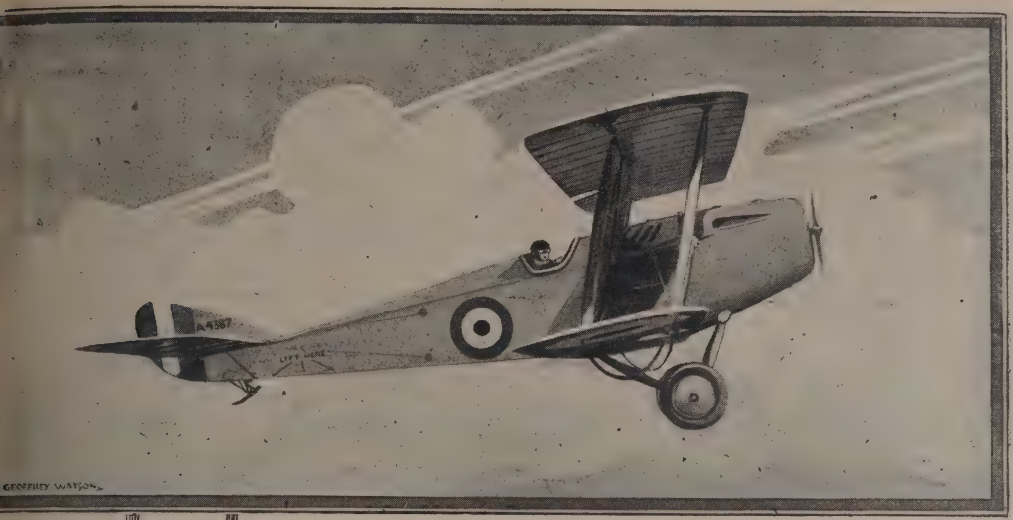
SOME OLD CONTROVERSIAL POINTS.

The next section of Mr. Lanchester's article is devoted chiefly to extolling the properties of the B.E. series. He assumes, entirely without grounds, that "the existence of the official design" is the "key to the whole attack." The real reason for the old attacks was the unfair preference given to official designs, both in machines and engines. There is no room in which to go over the whole of that ancient history again. One can only say that it is unfortunate t official designers never gave one an opportunity acclaiming their pre-eminence, for at no time has best official design had a performance equal to that the best contemporary unofficial design of similar ty For instance, the de Havilland 1 had a better perfo ance than the F.E. with a similar engine, and Armstrong-Whitworth with a 90-h.p. R.A.F. had better performance than the B.E. of its period. the available engines were ear-marked for B.Es., de H.1 was washed out, and the A.W. had to be fa up to take an engine for which it was not designed, was naturally spoilt in the process.

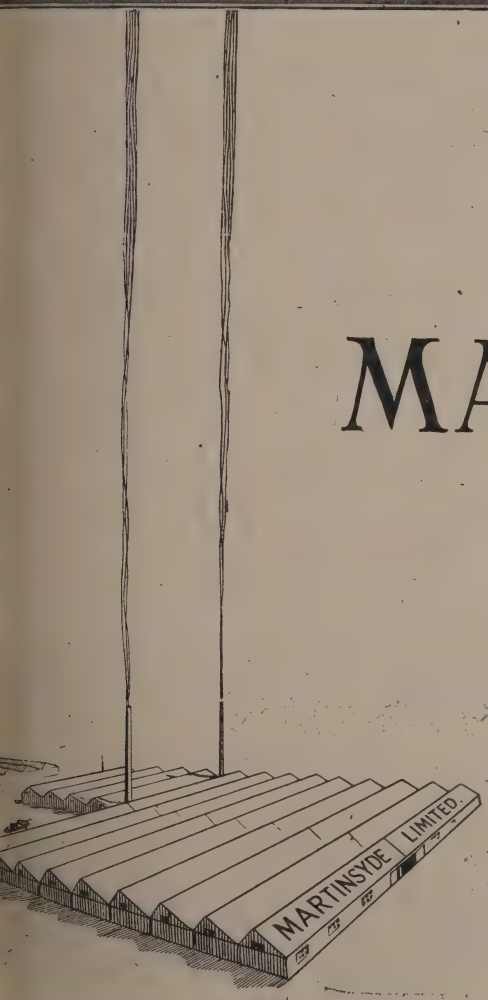
The ancient criticism of the B.E.2c., when it new, was not so much that its performance was though others were better, but that its detail des was so complicated that it cost far more than it n have done in labour and material. There is preci the same objection to the S.E. to-day. It simply me that we might have had more aeroplanes in the s time if these machines had been designed by pe with knowledge of quantity-production gained workshops, and not merely from books.

A Wholesale Condemnation.

The most damning criticism of the old adminis tion is found in Mr. Lanchester's own words when says, "The B.E. type, of which the B.E.2c. is (if may say so) the hack machine, and as such, the ba bone of the reconnaissance service, has held that posit for the whole three years of the war." What can think of an administration which so arranged thi that a machine had to be used for at least two ye after it became out of date? Can one be surprised Sir Douglas Haig's plea for a supply of the most up date machines?



Later, Mr. Lanchester says:—"It has been calle murder machine, because it was not quite equal speed or climb to some of the enemy's specialised fi ing scouts (the Fokker, for example)." "Not quite," fairly cool, considering that the machine was absolu outclassed.



And here, let me remind Mr. Lanchester, that "murder machine" phrase came into common early in 1916. At that date the French had alre bought the "1½ strutter" Sopwith (their first or was placed on December 20th, 1915). The first strutter appeared in June, 1915. To-day the Gerr lists of British machines which have fallen into t hands show that they are still bringing down Sopw of that 1915-16 type, now towards the end of 1917. A according to Mr. Lanchester, the 1914-15 type B.E —plus a more powerful engine admittedly, thou even so, only a 90-h.p. against the German 160-h.p

is still "the backbone of the reconnaissance Service." Does Mr. Lanchester seriously mean to defend an administration which left such a legacy to those who are trying so hard to put things right to-day?

One seems reasonably justified in assuming that if others had had the thousands of pounds which were poured out on the R.A.F. before the war, while the "trade" was left to starve, we should by now be far ahead of the enemy in every way.

Mr. Lanchester's Impartiality.

A little further on Mr. Lanchester says:—"I have broadly nothing to say against proprietary designs." One notices, however, that Mr. Lanchester has had little or nothing to say *for* them. In his various lectures to learned societies his illustrations have been almost entirely confined to R.A.F. products. The last book he published contained many photographs of officially designed machines, and, unless my memory plays me false, only one of a "trade" design, which was shown upside down, as the result of an accident. Such a curious selection may have been unintentional, but, if so, it was a singularly unfortunate attempt to suggest impartiality.

He continues: "There have been many very good machines designed and produced by our privately owned factories, and the country has much for which to thank those who, by their enterprise and perseverance, had established these factories prior to the outbreak of war." For such condescension, even if it be not damning with faint praise, the "trade" will doubtless be duly grateful, seeing that it comes from a member of the Government Advisory Committee for Aeronautics.

A Challenge.

After which, he says:—"But I do know enough about these private factories and their personnel and the machines they produced to be able also to state without hesitation that it is well for us that we are not entirely dependent upon them for our designs and output, and, above all, for our technical knowledge."

Now here is an excellent opportunity for Mr. Lanchester to prove at once his moral courage and his own knowledge. Let him give his reasons for such a statement. Let him boldly name names and give specific instances in proof of his assertion. He twits me with being wily enough to avoid putting charges in a form which would permit of their being challenged in a Court. He, however, will be in no danger of a libel action if he departs from the vague generalities of this and his succeeding charges against the Aircraft Industry. He can make his specific charges of incompetence in this paper whenever he pleases, and by doing so he will certainly assist in educating the Industry, if only in its knowledge of the competence of the Government Advisory Committee for Aeronautics.

Pilots as Judges.

On one point I agree entirely with Mr. Lanchester, that is when he says:—"Personally, I think that far too much weight is often given to the chance and ill-considered opinion of pilots, often men whose training is not even complete, of quite narrow and limited experience, writing under the stress of a hairbreadth escape or other untoward experience."

Personally, I always weigh a considerable amount of evidence before venturing to criticise any type or system. One of the faults of the old administration was that there was too much tendency to adopt or condemn a machine on the opinion of a few paid official testers or of Service pilots, who had had little or no experience of the best "trade" machines, who had every incentive to stick up for the official designs, and who occasionally had very definite prejudices against "trade" machi To-day the situation is rather different, but the tinued use of the R.E.8 seems to be a case of gi weight to the ill-considered opinion of pilots, in th man who has never flown anything better than a naturally feels pleased with the performance of 'an

I wonder, by the way, whether any independent has ever been given one of the engines used in R.E.8, with instructions to see what sort of mach it can produce for the same military purpose. I do happen to know of such an experiment, and if it not been tried, it might be worth while to try it, to see whether as good a performance, or even be cannot be got without the particular defects of R.E.8.

A Side Issue.

Mr. Lanchester devotes considerable space to a l read in the House of Lords by Lord Montagu rela to the destruction by a storm of a de Havil squadron when starting for France early in though what it had to do with the present argume hard to discover. However, it may be well to exp as Mr. Lanchester does not do so, that the mi occurred through inexperienced pilots starting ou machines to which they were unaccustomed. It nothing to do with the machines as such, and Montagu's criticism was directed at the sending of pilots without sufficient training on the mach which they would have to fly on active service.

This trouble—caused chiefly at the time by the p ing demand from the front for more men and and better machines—is not likely to occur in fu and it would not have occurred then but for the takes of the previous years.

A RETURN TO MODERNITY.

Thereafter, Mr. Lanchester returns specifically to Sunday paper articles, and points out that "we ma least, rest satisfied that in the hands of such thorou experienced men as Sir William Weir and Mr. P Martin the possibilities of utilising to the full manufacturing resources of the country are not b neglected." With which, of course, everyone agree. At the same time, neither Sir William nor Mr. Martin can be everywhere at once, nor can see personally to everything which the various de ments and sub-departments under them are doing.

Some of those departments are extraordinarily run. Some of them are quite up to any reason average of efficiency. And some are, undoubtedly, It seems very unlikely that either of the officials tioned will resent having their attention drawn to bad spots. If they already know where trouble exists are already putting it right, criticism can do no h and, if they have not yet discovered the whereabou the trouble, criticism may help them to find it. who have had dealings with the Air Board speak i highest terms of the efforts which are being mad the Controller of Aeronautical Supplies, and I, for have the keenest possible desire to help whenever sible. Surely, pointing out weaknesses is one good to help towards strength.

A Matter of Evidence.

Mr. Lanchester seems annoyed because in articles when writing of squandering our resources evidence is offered; we are asked to take it merel the assertion of the writer of the article." If Mr. chester will do me the honour of reading The A PLANE for the last few months he will find, if not evidence within the meaning of the Act, at least ments as to how waste is caused, which state

FLAMING AEROPLANE—OFFICER'S FIGHT FOR LIFE.

"Major Bannatyne, D.S.O. who fell with a burning aeroplane on Thursday and was admitted to Cirencester Red Cross Hospital, was slightly better yesterday than the day before, but at a late hour was still in a critical condition.

"Up alone, his engine failed at 1,000 feet, and the machine, falling, took fire. The flames reaching his legs, he climbed out of his seat, and along the body of the machine to the tail. The flames caught him again and he slipped down the frame and hung by his hands. Even there the heat was almost unbearable, but just before the machine was smashed on a shed he swung clear and landed on some freshly dug ground. He is suffering from severe shock, a broken arm, and cuts about the face, head, and body.

"By the fall of a biplane at Hanworth, Middlesex, on Saturday, Lieut. Roberts was thrown into an orchard and killed."

THE "GUARDIAN ANGEL" PARACHUTE (A TYPE) WILL BRING A MAN DOWN SAFELY FROM ANY HEIGHT ABOVE 200 FEET.

should be sufficient to put him on the track towards finding evidence.

Unfortunately, neither the editor of *The Sunday Times* nor of *The Observer* saw fit to place at my disposal unlimited space in which to go into details. At any rate, the whole "trade" agrees as to inefficiency of production caused by "scrapping."

Back to Ancient History Again.

Referring to my statement that "Our aviators are to-day paying for a policy which before the war refused orders for British-built aero-engines, and bought engines from France pending the production of a wonderful engine from the Royal Aircraft Factory, which was to be the standard engine for the Service," Mr. Lanchester says: "Admittedly, the orders placed for aero-motors were very limited; they were regulated by the number of aeroplanes, and this by the establishment, as determined by the money available."

That, of course, is true, so far as it goes. As Mr. Lanchester admits, "In the matter of aero-motors the French held the lead, and it was more than difficult to interest British motor firms in the aero-motor; that I can vouch for as a matter of personal experience." Naturally; because motors were ordered from France, so that the Services could carry on their work, and what was left of the money was spent on the R.A.F. and its experiments.

Small wonder that British motor firms were not interested, when there was no assurance of orders. Naturally, capitalists were shy, and only enthusiasts continued to experiment. And will Mr. Lanchester explain why, when Mr. Holt Thomas offered in 1913 to start building Gnômes in this country if assured of an order for only 50 engines, such an assurance was refused him, although many more than 50 Gnômes were bought from France before the war?

Comparative Opportunities.

It would be interesting if Mr. Lanchester, with his inside knowledge, would make it known how much money was allotted to the R.A.F. before the war, and spent on R.A.F. designed machines built by contractors, and how much was spent on British-built aeroplanes and engines of "trade" designs—excluding, therefore, machines of R.A.F. designs built under contract.

Is Mr. Lanchester seriously of the opinion that, if the R.A.F. had been tied down to the same money as were the private firms, and if it had only had the same prospects, it would have done as well? Would they have got as far as, say, the 80-h.p. Avro, or the 80-h.p. Sopwith two-seater, or the Roumanian Coanda-Bristols? And even with all their extra thousands, and their certainty of more thousands of their Treasury grant to come regularly every year, even if they produced nothing worth having in one year, how much further did the R.A.F. really get?

It may be well to recall that M. Blériot built 12 machines and spent £40,000 in experiments before he flew the Channel (on Blériot XI), so it may be seen how little chance the British constructors had.

HISTORICAL INACCURACIES.

In the face of all his support of official actions, Mr. Lanchester says:—"The fact that the enemy possessed at the outset an engine of more powerful type than our own, and the equipment for its manufacture, had its origin in the enterprise which the German nation and the German Government prior to the war had for years been showing in the development of the Zeppelin airship rather than any particular foresight in the matter of aeroplane development." This in itself is an admission that our official people did not take aeronautics in general seriously, but even so, Mr. Lanchester is right off the rails of fact.

Has he ever heard of the *National Flugspende* of 1913, when hundreds of thousands of pounds were collected, with the backing of the German Army, solely for prizes in aeroplane competitions? Has he ever heard of the officially organised Prinz Heinrich aeroplane tours, combined with competitions at the various controls, in which officer aviators were encouraged to compete with professionals for prizes given by the Imperial and State Governments? Has he ever heard of the Kaiser Preis of 1913 for aeroplane engines, with the supplementary prizes given by the War Ministry and the Ministry of Marine? As a matter of fact, the Benz and Mercédès aeroplane engines had nothing to do with the Zeppelin engines, which were Maybachs of quite different type

Comparative Performances.

It is true that, as Mr. Lanchester says, "In the early stages of the war our machines were putting up a performance equal to the enemy machines on far less horsepower," but our people, apparently, were only up against the old-fashioned four-cylinder 75-h.p. Taubes and such things. German biplanes were scarce on the West front for quite a time, probably because most of the best German machines had gone East to patrol the vast areas attacked by the Russians' immense armies.

At any rate, we know that before the war the Germans possessed many aeroplanes far better than anything they produced on the West front for a long while. Reference to German records for duration, distance, height, and speed just before the war prove that much clearly enough, and a friend of mine, who was at Johannisthal two days before war was declared with England saw a dozen Albatros biplanes start in one bunch for Vienna, *en route* for the Russian front.

All of which was directly due to German military encouragement of precisely the kind which was lacking in this country.

Those Streamline Wires.

Mr. Lanchester is bold enough to claim for the "official designer" much of the aerodynamic efficiency of our early machines, and adds: "Of the various individual items of improvement . . . none has had so great an influence as the streamline wire, otherwise known as the R.A.F. wire, and the advantage was demonstrated at Farnborough beyond dispute as adding *several miles per hour* to the speed of the machine."

Against this, I would point out that an R.A.F. wire is only approximately a streamline when a machine is at its absolutely correct flying angle. When a machine is sagging about near its "ceiling," streamline wires must increase, instead of decreasing, its head resistance, and, similarly, when it is diving past its proper flying angle. The mere howling of streamline wires under certain conditions seems proof positive that they waste power, for the vibration which causes the noise must be caused by air resistance. Also, they are dangerous, because of their liability to breakage owing to vibration, they are costly in labour and material to produce, and they produce a high proportion of scrap in manufacture.

Whatever advantage they do give, when flying at their one correct angle, it seems at least probable that as great a saving in head-resistance can be effected by using two plain wires or cables, with a flitch of wood between. Where the R.A.F. wire really scores is probably because its end-joints are neater than the ordinary loops or splices, which, where several wires end at the same point, set up an ugly bunch of resistance.

BOMBAY, Hughes Road, Cumballa Hill

One of our most successful of aeroplane designers has steadfastly refused to fit R.A.F. wires, and yet his machines do their performance quite satisfactorily, and I know the pilots feel happier on them. There is just the possibility that R.A.F.-wires may be worth while on a very small fast machine, though even there I can put one or two highly successful aeroplane designers up against Mr. Lanchester—who cannot, unfortunately, be called a successful aeroplane designer—but on a big machine with long stretches of wire there seem to be better ways of getting performance than by using these so-called wires, which are really swaged rods, and, therefore, unsuited to stand vibration.

QUANTITY PRODUCTION AGAIN.

Mr. Lanchester assumes that "Mr. Grey has evidently had no experience of quantity production, otherwise he would know that it will always be the case, so long as there is progress, that the latest and best designs will not be available in sufficient quantity." It all depends what Mr. Lanchester means by experience. I do not suppose that anyone in this country knew very much about quantity production before 1895 or so, and I had a fair amount of factory experience in those days. Mr. R. F. Hall's equipment of Cleveland screw machines, at his original Stellite Works, was, at any rate, something of a novelty even in 1896. And, so far as my recollection of the motor trade goes, I cannot recall that Mr. F. W. Lanchester in the rôle of workshop boss was any great success as a quantity producer of the tiller-steered, double-opposed-horizontal-engined horseless carriage which he designed some years later. It so happens that until a matter of eight or nine years ago I made a more or less honest living by doing things instead of merely writing about them.

Anyhow, be that as it may, I am not so out of touch with productive methods as to imagine that the newest and best machines can be produced in quantities immediately the first of the type has been accepted as suitable for service. All I have asked is that the decision as to whether a type shall or shall not be accepted shall be made as quickly as possible, and that when accepted it shall be reproduced as quickly as possible.

Modern Improvement.

Things are improving rapidly in this direction under the existing administration. Consider the B.E.2c. produced in 1914, and still in use; or the "1½ strutter" Sopwith produced in June, 1915, ordered in December, 1916, still built in quantities in 1917, and still in use; and compare these with the handling of certain more recent machines, which must be nameless, which only appeared for the first time a mere six or eight months ago, and are now coming through in quantities. We may yet hope to arrive at the time when a new machine officially adopted one day may begin quantity deliveries six weeks later.

That appears to be the limit for quantity production, so far as my aeroplane workshop knowledge goes. And I doubt whether Mr. Lanchester, for all his professorship, and his Government appointments, and advisory posts, has seen very much more of the inside of successful modern aircraft factories than I have—or is personally acquainted with more works managers and other practical aircraft producers than I am.

Anyhow, on the question of quantity production I should like him to compare the detail designs of any of the officially designed series of machines with the details of any of the successful trade-designed machines, and then give his honest opinion on the two.

The Treatment of Obsolescence.

Mr. Lanchester is further pleased to take me to task for suggesting "Ruthless scrapping of obsolescent designs, and immediate cancellation of all contracts for such designs, followed by immediate placing of contracts for new designs," and asks, "Does Mr. Grey suggest that it will facilitate the efficiency of the R.F.C. or the R.N.A.S. to deprive them of some of the supplies for which they have arranged to take delivery?" Frankly, I do not know what Mr. Lanchester means by "facilitate the efficiency." I suppose he means "maintain" or "increase" efficiency, but facilitating efficiency is beyond my comprehension. Also, I suppose, he meant to write "*of* which they have arranged to take delivery." Anyhow, when I wrote designs I meant designs, and not, as Mr. Lanchester seems to think, machines already in existence, or partly finished.

In other words, I meant that when a better machine for a certain purpose is produced, and is accepted by the technical staff of either Service, existing machines for that purpose become obsolescent—though not absolutely obsolete. Therefore, instead of going on building them—as, for instance, building B.E.2cs. in 1916-17, "1½ strutters" in 1917, and de Havilland pushers, and F.E.8s, and R.E.7s, any time up to the end of 1916—the designs should be scrapped, so far as fresh orders are concerned, existing contracts should be cancelled, so far as the portions on which work has not been started are concerned, and orders for the new type should be placed immediately so that there may be no cessation of work. Does Mr. Lanchester quarrel with that suggestion?

One cannot explain all these details in the limited space afforded by a non-technical paper, such as *The Observer* or *The Sunday Times;* one has to rely to some extent on the intelligence of one's readers. Apparently, Mr. Lanchester, judging by his own fondness for elaboration of detail description in his lectures and writings, has never been faced with the trouble of dealing with a large subject in a small space, and I can promise him that if he cares to continue in this paper his attack on me, or if he cares to answer the various questions I have asked him, he shall have all the space he wants, in which he can be as prolix as he pleases, and as abusive as he likes, even if I have to publish him as a serial story or a feuilleton.

A Little Encouragement.

When he refers (in italics) to one of my statements as *"The bald assertion of a self-appointed critic, unsupported by any evidence whatever,"* he rather amuses me, for I have never yet met a critic who was appointed by anyone other than himself, nor do I recall a critic who quotes examples to support his case to a greater extent than I do, when space permits. I feel sure that Mr. Lanchester can do better than that in the way of opprobrious epithets if he really tries, and I do hope he will accept my invitation to use The Aeroplane as the rostrum for his next oration. It is a pity that he should waste his sweetness on the desert air of a minor publication.

Besides, if Mr. Lanchester were not several Government officials rolled into one, and a mathematician, and an advisory expert, and several other equally exalted things at the same time, I believe we might be quite good friends, for we have several qualities in common besides prolixity—for example, we hate our friends' enemies so heartily, even when we do not know anything about them personally.

Meantime, I apologise to my readers for taking up so much space, for which they pay, with what is in fact a personal argument between Mr. Lanchester and myself, and I promise not to offend again to the same extent.—C. G. G.

From a painting by Mr. SANDFORD PITT.

KINDLY MENTION "THE AEROPLANE" WHEN CORRESPONDING WITH ADVERTISERS.

THE ROYAL FLYING CORPS AID COMMITTEE.

Subscribers and donors to the funds of the Royal Flying Corps Aid Committee, over which Lady Henderson presided, have received a circular containing an abbreviated copy of the report presented on July 2nd, 1917. It outlines the work done by the Committee during the seven months ending December 31st, 1916, which includes the sending of small individual parcels periodically to every man in the R.F.C. in France, Mesopotamia, Africa, the Balkans, Egypt, and India. These parcels contain various small comforts not included in Army issues. In addition, a large number of garments have been sent out in bulk.

A special feature is the sending of parcels to prisoners, both officers and men, containing food and various other home comforts. In this connection it may be well to point out that private individuals are not allowed to send parcels to prisoners, and therefore the friends of officer prisoners may be glad to avail themselves of the aid of the Royal Flying Corps Aid Committee in getting necessaries to their friends. Naturally, when circumstances permit, the Committee are always glad to receive donations to cover the cost of sending parcels to any particular individual. At the time of the issue of the report 387 officers and 40 N.C.Os. and men of the R.F.C. were known to the Committee as prisoners in Germany, and practically all are recipients of regular parcels, chiefly containing food.

One notes from the report that of the many officers in the R.F.C. with whom the Committee have got into touch, only three or four have died in Germany through wounds, which seems to indicate that they are being well treated by their captors. Communication with prisoners in other countries is much more difficult, but every effort is made to keep in regular communication with every known prisoner, no matter in what country he may be.

Owing to the high cost of printing, it has been deemed inadvisable for the Committee to incur the expense of printing a list of subscribers, but those interested may consult a list at the offices of the Committee.

Now that the R.F.C. has increased so greatly in size, the effort to keep the whole of the personnel supplied with home comforts during the forthcoming winter will tax the efforts of the Committee very seriously, and they hope that those who have previously subscribed will feel able to renew their support and that new friends will come along to swell the coffers.

Donations in cash and kind should be addressed to the Fund at Surrey House, Marble Arch, London, W.1.

In conclusion one would like to point out that the receipts and payments made during the seven months under review show that an extremely small proportion of the Committee's funds have been expended in administration. Goods to the value of £5,800 have been purchased and distributed for a matter of £350, and naturally this amount includes the expense of distributing a large number of garments and other goods donated in kind.

LORD MONTAGU AND AIR RAIDS.

Lord Montagu of Beaulieu, opening Lady Drogheda's Air Service Exhibition at Sheffield on Sept 7th, said they owed a great debt to the Air Service for the immunity they now enjoyed. The Zeppelin peril now appeared to be passed, but a new one confronted them—that of the aeroplane by night.

In regard to the conditions at the various fronts, he was able to tell them that in man-power and money-power the Allies were still superior to the Central Powers, and even if Russia no longer helped, though he did not despair of its recuperation, it would not by any means follow that Germany could win. It was, however, his firm personal conviction that our victory when it came would be from the air. On all fronts there was stagnation of infantry, while the flying forces were doing nearly everything that the rest of the Army could do. The direction and observation of artillery, not less than scouting, were almost entirely done by aeroplane, and he said deliberately that no Army could attack, pursue, or achieve complete victory witnout its flying corps.

They heard a good deal about the recent bombing of London districts and certain places in the South-East corner of England, but he thought it was necessary to retain a proper sense of proportion about those matters. He had ascertained that so far the casualties resulting from aeroplane attacks since January 1st totalled less than 2,000, the exact figure he believed being 1,650. Compared with casualties at the front such a figure was absolutely negligible. Deplorable though it was that civilian lives should be so sacrificed, he did not believe the English people were going to be so craven-hearted as to desire to deplete the Air Service at the front in order to protect lives at home, because, after all, in a military sense, civilian lives were of much less account than those of our fighting men.

He did not deny that home defence was a very important matter, and especially that London, the nerve centre of the war, should be protected as far as possible. He had never minimised the risk of bombing raids causing fire, and if no panic, at any rate a resentment and feeling that all possible had not been done to protect the population at home, but what was the real truth of the matter? He could assure them that we in common with our Allies, and he knew also the same thing applied to Germany, had not got enough aircraft to do the work which they desired of them, and there was a shortage of machines. He was not discussing the responsibility for that, but the fact must be faced that we could do with double as many aeroplanes as we had got. He could, however, tell them a piece of comforting information, that the Government and the two Air Services were doing their best to remedy that shortage.

With the possibility that the enemy might be relieved of Russian pressure, and thus be enabled to bring more pressure to bear upon us, he appealed to those engaged in aeroplane construction for God's sake, and for the sake of our gallant men at the front, not to let any domestic disputes hinder the output of aircraft. The wastage in aeroplanes was far greater than the man in the street had any conception of, and we must produce immense numbers in excess of the number yet contemplated. Our pilots compared well with those of any belligerent nation. But fine as they were the people of this country must be warned against clamouring for the impossible. When air raids took place there was a great danger that demands would be made that our aviators should go up on what he could only describe as a wild-goose chase. Could they imagine what chance of success a man had, going up on a dark night, when he could only see lights below and the stars above, and hear no sound but the noise of his own machine? Even if he should chance to see another aeroplane he had to discover whether or not it was an enemy. The difficulty was immense and personally he regarded it as a waste of the man's life and of the machine. What should be done, and what was being done, was to bomb German aerodromes at the front and bomb their towns behind the lines. (Applause.) To harass the wasps' nest instead of trying to kill the individual, that was the policy which was being adopted and it was most effective.

AIR BOARD NOTICE.

STANDARDISATION OF AERO-ENGINE RADIATORS.

In the recently published annual report of the Advisory Committee for Aeronautics it was stated that the investigations on the subject of aeroplane radiators had been brought to a conclusion, and recommendations made for standardisation.

Effect has now been given to these conclusions by the Air Board, and a confidential circular letter has been issued to aeroplane contractors and radiator makers, instructing them as to the material which is to be used for this purpose in future designs.

Enquiries on the subject may be addressed to the Department of Aeronautical Supplies, Room 609, Air Board Office, Strand, W.C.2.

FROM THE "LONDON GAZETTE."

War Office, Sept. 4th.

REGULAR FORCES.—Memorandum.—Bt. Lt.-Col. (temp. Brig.-Gen.) J. M. Salmond, C.M.G., D.S.O., R. Lanc. R., to be temp. Maj.-Gen., June 22nd (substituted for the notification in the "Gazette" of July 28th).

War Office, Sept. 5th.

REGULAR FORCES—Establishments—R.F.C.—Mil. Wing.—Wing Comdr.—Lt. (temp. Maj). R. A. Cooper, D.S.O., Yeo., T.F., from a Sqdn. Comdr., and to be temp. Lt.-Col. while so empld., Aug. 17th.

Schools of Instn.—Schools of Aerial Gunnery.—The following appts. are made :—

Comdt.—Graded as a Wing Comdr.—Temp. Maj. A. R. C. Cooper, Gen. List, from a Chief Instr. (graded as a Sqdn. Comdr.), and to be temp. Lt.-Col. while so empld., Aug. 6th.

Chief Instr.—Graded as a Park Comdr.—Temp. Capt. H. Cockerell, Gen. List, from an Instr. (graded as an Equipment Officer, 1st Cl.), and to be temp. Maj. while so empld., Aug. 16th.

War Office, Sept. 6th.

REGULAR FORCES.—The following N.C.O.'s and Men to be temp. Sec. Lts. :—R.F.C.—Mil. Wing.—1st Cl. Air Mech. H. M. Haines, May 17th. 2nd Cl. Air Mech. R. A. Davey; 2nd Cl. Air Mech. L. G. Candy, from S. Afr. R.F.C., June 22nd. 1st Cl. Air Mech. L. Hawkins, June 23rd. Flt. Sgt. F. Little, June 26th. 1st Cl. Air Mech. C. F. Cotton, June 27th.

Establishments.—R.F.C.—Mil. Wing.—Flt. Comdrs.—From Flying Officers.—Capt. G. A. R. Spain, Ind. Army, July 1st. Temp. Capts. whilst so empld. :—Temp. Lt. K. S. Henderson, Gen. List, July 10th. Lt. D. Cloete, M.C., Spec. Res., July 20th. Capt. W. E. Birch, S. Lan. R., T.F., Aug. 8th. Sec. Lt. (temp. Lt.) W. A. Shirlaw, High. L.I., T.F., and to be temp. Capt. whilst so empld., Aug. 13th. Capt. H. S. Lees-Smith, Spec. Res. ; Sec. Lt. C. C. Clark, R.A., and to be temp. Capt. whilst so empld., Aug. 21st; Sec. Lt. (temp. Lt.) W. V. T. Rooper, Yeo., T.F., and to be temp. Capt. whilst so empld., Aug. 24th.

Park Comdr.—Capt. H. B. T. Childs, Spec. Res., from an Equipment Officer, 1st Cl., and to be temp. Maj. whilst so empld., Aug. 25th.

Special Appt.—(Graded as an Equipment Officer, 1st Cl.).—Lt. R. H. C. Usher, M.C., Wilts R., Spec. Res., from a Flying Officer, and to be temp. Capt. whilst so empld., Aug. 22nd.

Schools of Instn.—Schools of Aerial Gunnery.—Chief Instr.—(Graded as a Sqdn. Comdr.).—Temp. Capt. G. Dixon-Spain, M.C., Gen. List, from an Asst. Instr. in Gunnery (graded as an Equipment Officer, 2nd Cl.), and to be temp. Maj. whilst so empld., Aug 20th.

War Office, Sept 7th.

REGULAR FORCES—Establishments—R.F.C.—Mil. Wing.—Wing Comdr.—Capt. (temp. Maj.) R. R. Smith-Barry, Spec. Res., from a Sqdn. Comdr., and to be temp. Lt.-Col. whilst so empld., Aug. 23rd.

Special Appt.—(Graded as an Equipment Officer, 1st Cl.).—Capt. C. W. von Roemer, R.F.A., Spec. Res., July 16th.

Schools of Instn.—Officers' Technical Training Corps.—Comdt.—Temp. Capt. F. A. Forde, Gen. List, from an Asst. Comdt., Staff Officer, 2nd Cl. (graded as a Brig-Maj.), and to be temp. Lt.-Col. whilst so empld., July 19th.

War Office, Sept. 10th.

REGULAR FORCES—Establishments.—R.F.C.—Mil. Wing.—Flt. Comdrs.—Temp. Lt. P. A. Moodie, Gen. List, from a Flying Officer, and to be temp. Capt. whilst so empld., Feb. 17th, but without the pay and allowances of that rank prior to Aug. 27th. Capt. N. H. Bottomley, E. York R., Spec. Res., from a Flying Officer, Aug. 1st.

Flt. Comdrs.—From Flying Officers.—Capt. E. D. Drew, R.W. Surr. R. ; Capt. W. A. Skeate, W. York. R., Aug. 27th. And to be temp. Capts. whilst so empld. :—Temp. Lt. P. G. Marr, Gen. List; Lt. P. B. Tabernacle, Can. Local Forces; Lt. H. H. Watkins, R.F.A., Spec. Res. ; temp. Lt. V. G. A. Bush, Gen. List; Lt. R. W. A. de H. Haig, R.G.A., T.F. ; Sec. Lt. (temp. Lt.) M. H. Turner, Dorset R., Spec. Res. ; Sec. Lt. (temp. Lt.) G. H. Lewis, North'n R., T.F. ; temp. Lt. J. Kerr, Gen. List; Sec. Lt. (temp. Lt.) A. H. Whistler, Dorset R. ; Sec. Lt. (temp. Lt.) D. G. A. Allen, Durh. L.I., Spec. Res. ; temp. Lt. V. H. Baker, M.C., Gen. List; Sec. Lt. G. A. Giles, Spec. Res. ; temp. Lt. A. Morrison, Gen. List; temp. Sec. Lt. D. M. Faure, Gen. List; temp. Sec. Lt. I. E. M. Mackenzie, Gen. List.

Special Appt.—(Graded as a Park Comdr.).—Capt. C. A. J. Butter, Yeo., T.F., and to be temp. Maj. whilst so empld., Aug. 21st.

Gen. List.—To be Sec. Lt. :—Actg. Sgt.-Maj. J. C. Shakeshaft, from R.F.C., July 31st.

FROM THE COURT CIRCULAR.

Windsor Castle, Sept. 5th.

The following had the honour of being received by His Majesty, when the King conferred upon them the Military Cross.

Capt. Henry Meintjes, Gen. List and R.F.C.
Lieut. Francis Cave, Rifle Brigade and R.F.C.
Lieut. Mayes Fry, Gen. List and R.F.C.
Sec. Lieut. Reginald Malcolm, Gen. List and R.F.C.
Sec. Lt. George Wells, R.F.C.
Sec. Lieut. Arthur Wray, The Buffs, attd. R.F.C.

NAVAL.

The following appointments have been made in the Royal Naval Air Service :—

Sept. 7th.—Messrs. R. A. Coote and H. Bailey, both granted temp. commns. as Lt. (R.N.V.R.), seny. respectively, Aug. 31st and Sept. 6th.

Sept. 8th.—Temp. commd. as Lt. (R.N.V.R.) have been granted to the following, seny. Sept. 7th :—F. D. Taylor, A. M. W. Wells, J. O. W. G. Chambers, and L. F. Lambert.

Sept. 10th.—Mr. W. M. Johnson granted a temp commn. as Lt. R.N.V.R., with seny. of Sept. 8th.

Admiralty Communiqués.

Sept. 4th.—A bombing raid by naval aircraft was carried out at midnight on 2nd inst. on docks, submarine shelters, and railway sidings at Bruges.

Bombs were observed to explode over objectives, and a fire was caused adjacent to the lock gates of the Ecluse Canal.

A raid was also made in the early morning of 3rd inst. on Varssenaere aerodrome (south-west of Bruges); bombs were seen to explode amongst the sheds. One of our machines was attacked by six hostile aircraft, and succeeded in shooting down one completely out of control.

In an engagement which took place between one of our aircraft patrols and enemy machines there were three decisive combats.

One of our machines failed to return.

Sept. 5th.—At midnight on the 3rd inst., a bombing raid was carried out by Naval aircraft on the following military objectives :—

Bruges Docks.
Varssenaere Aerodrome (south-west of Bruges).
Ghistelles Aerodrome (south-east of Ostend).

Many tons of bombs were dropped with good results.

A second raid on Bruges docks was made at noon on Sept. 4th. Direct hits were observed on special targets. Many sheds along the quay side were also hit and large fires were caused, which could still be seen burning when machines recrossed the lines.

All machines returned safely from both raids.

During Monday afternoon (3rd inst.) an enemy aircraft spotting machine was engaged by one of our fighter patrols, and shot down completely out of control.

An enemy kite balloon was also attacked and the observer forced to jump out. Owing to anti-aircraft fire the fate of the kite balloon could not be observed.

"ASCOL" SERVICE MEANS INCREASED OUTPUT!

A report has been received stating that an attack was carried out against Adrianople on the night of Sept. 2nd-3rd by machines of the Royal Naval Air Service.

Bombs were dropped on the railway station and bridge (over the Maritza) with good effect.

THE CASUALTY LIST.

Reported Sept. 5th.

PREVIOUSLY REPORTED MISSING, NOW REPORTED KILLED.—
Saunders, Flt. Sub-Lt. R. G., R.N.
Pegler, Flt. Sub-Lt. C. R., R.N.

Reported Sept. 6th.

ACCIDENTALLY KILLED.—Thomas, Flt. Sub-Lt. J. E., R.N.
PREVIOUSLY REPORTED MISSING, NOW OFFICIALLY REPORTED PRISONERS.—Brady, Flt. Sub-Lt. B. J. W., R.N.
Marsh, Obsr. Sub-Lt. L., R.N.
DIED OF WOUNDS.—Whitehouse, H. A., Aircraftsman, 1st Cl., F.19467.

Reported Sept. 7th.

MISSING.—Hall, Flt. Sub-Lt. N. D., R.N.
Scott, Flt. Sub-Lt. G. B. G., R.N.
WOUNDED.—Howard, Flt. Sub-Lt. G. E. C., R.N.

Reported Sept. 8th.

ACCIDENTALLY KILLED.—Coombe, Flt. Officer A. S., R.N.
ACCIDENTALLY DROWNED.—Varden, Flt. Sub-Lt. M. S., R.N.
ACCIDENTALLY INJURED.—Saunders, Flt. Sub-Lt. C., R.N.
Elliot, Obsr. Sub-Lt. G. H., R.N.

Reported Sept. 10th.

MISSING.—Foster, Flt. Sub-Lt. W. E., R.N.
Burns, Obsr. Sub-Lt. H., R.N.
SEVERELY WOUNDED.—McCrudden, Flt. Sub-Lt. S. H., R.N.

Reported Sept. 11th.

DIED OF INJURIES.—Dawson, Prob. Flt. Officer J. M., R.N.

PERSONAL NOTICES.

Deaths.

COOMBE.—Flt. Lt. Coombe was killed on Sept. 7th at Chingford, when his machine fell into the reservoir. The passenger, Proby. Flt. Officer Saunders, who was badly injured, was taken to the Edmonton Military Hospital.

DAWSON.—The death has occurred in an hospital on the North-East Coast of Prob. Flt. Officer John Marshall Dawson, R.N., aged twenty-one, as the result of injuries sustained through a fall whilst flying on Sept. 7th. His home was at Sixshell Bank, Ripon.

THOMAS.—The inquest on Flt. Sub-Lt. J. E. Thomas, R.N., aged 23, whose death in a flying accident near Yeovil on Sept. 3rd was announced last week, was held on Sept. 5th. Sqdn. Comdr. Evill, D.S.C., R.N., said that in his opinion the accident was due to the pilot's over-confidence in the machine. He had been used to handling more powerful machines, which would stand more trick flying than the one he was using. The accident was caused by a little lack of caution while at too low an altitude. An engine mechanic stated that there was some trouble in starting the engine, but the engine was running all right when Mr. Thomas went away. The witness said he had never run one of these engines before. He did not like the engine. The jury returned a verdict of "Accidental death," adding a rider that officers should not be called upon to fly machines the engines of which they did not know.

VARDEN.—Flt. Sub-Lt. Medwin Seymour Varden, who was drowned on Sept. 4th as the result of a flying accident, was the second son of Mr. and Mrs. Varden, Highview, Seaford. He was 20 years of age, and had a seniority of December, 1916.

Marriages.

ATKINSON—BILLEN.—On Aug. 18th, at the Mairie of the 12th Arrondissement, Paris, Lt. J. Clifford Atkinson, R.N.A.S., only son of Mr. J. E. Atkinson, of Reading, was married to Mdlle. Marcelle Billen, lately nursing on the Western Front, daughter of M. Ludovic Billen, of Lens, Yonne, France, art critic.

JONES—ASTLEY ROBERTS.—On Sept. 5th, at St. Saviour's Church, Eastbourne, Sqdn. Comdr. Robert Hilton Jones, R.N., only son of Mr. and Mrs. Robert Jones, formerly of Barmouth, Wales, was married to Eileen Ruby Astley, only daughter of Col. Astley Roberts, R.F.A., and Mrs. Astley Roberts, of Badlesmere, Eastbourne, by the Vicar, the Rev. H. Urling Whelpton, assisted by the Rev. C. W. Horsburgh.

SHOPPEE—GIFFORD-TAIT.—On Wednesday, Sept. 5th, at All Saints, East Cowton, Northallerton, between Flt. Lt. Lionel Conrad Shoppee, D.S.C., R.N., son of Eustace Cyril Shoppee, Esq., of Cape Town, S. Africa, was married to Hilda Gifford-Tait, daughter of the late Capt. Tait, R.N.R., and Mrs. Tait, Cardiff, and niece of the Rev. R. Gifford-Wood, M.A., B.A., Vicar of East Cowton.

The ceremony was performed by the Lord Bishop of Knaresborough, assisted by the uncle of the bride. The bride was given away by Gen. Sir Herbert Chernside, G.C.M.G., late Governor of Queensland. A reception was held at the Vicarage and afterwards Lieut. and Mrs. Shoppee left by motor to spend the honeymoon at the English Lakes.

WATT—REID.—On Sept. 3rd, at St. James's, Edmonton, Flt. Sub-Lt. Norman Charles Watt, R.N., elder son of Capt. I. Watt, Adjt., National Guard, formerly of H.M. Coldstream Guards, and Mrs. Watt, of Sneath Avenue, Golders Green, was married to Dorothy Sherwood, only daughter of A. W. Sherwood Reid and the late Mrs. Reid, of Edmonton, Middlesex, by the Rev. A. E. Brooks, A.K.C.

Births.

DONALD.—On Sept. 3rd, to Gwynneth Adrienne, wife of Flt. Lt. D. Grahame Donald, R.N.—a son.

TOMKINSON.—On Sept. 8th, at Bentley, Suffolk, the wife of Squad. Comdr. Lancelot Tomkinson, R.N., of a daughter.

The wanderings of an observation balloon attracted considerable attention on Sept. 4th. It broke adrift from its moorings at Barnes and passed over Acton, where there was great excitement when an aeroplane appeared and circled round it.

It came to earth eventually at Piters Farm, near Rickmansworth, at 8.10 p.m., when it was discovered that the balloon was in charge of an officer of the R.N.A.S., who landed unhurt.

[The last sentence has a pleasing ambiguity. To be "in charge of" may be taken either way.—Ed.]

MILITARY.

G.H.Q. Communiqués.

SEPT. 4th, 9.0 p.m.—There has been some bombing by the enemy of various places behind our lines during the last two nights. At some of the points attacked a few casualties occurred amongst soldiers and civilians, and some damage was done to private property. No damage of military importance was caused. Last night one of the enemy's machines employed on these operations was brought down by our fire.

The improvement in the weather led to great activity in the air yesterday on both sides. Much successful work was done in co-operation with our artillery, and many photographs were taken. In the course of the day and night over five tons of bombs were dropped by our aeroplanes on the enemy's railway stations, billets and aerodromes.

Enemy aircraft were aggressive in air fighting. Twelve German machines were brought down, and five others were driven down out of control.

Seven of our aeroplanes are missing.

SEPT. 5th, 9.4 p.m.—Artillery activity continues on both sides on the Ypres battle front.

Last night enemy aeroplanes again dropped bombs at different places behind our lines. A few casualties were caused in one of our hospital areas and some damage has been done to civilian property. There was no damage of military importance. One of the enemy's raiding machines was brought down by our fire and destroyed.

Our aeroplanes have continued bombing operations actively by day and night.

Yesterday great activity in the air prevailed on both sides. Our artillery, machines, and balloons worked all day in co-operation with our artillery in spite of vigorous attacks from hostile aeroplanes.

A record number of aerial photographs were taken by us, many of them at great distances behind the enemy's lines.

Though the enemy's aeroplanes showed themselves disinclined to meet our fighting machines unless well east of the line, five hostile machines were brought down in combat and nine others driven down out of control.

Seven of our machines are missing.

SEPT. 7th, 10.7 a.m.—Further information shows that on the night of the 4th-5th inst. German aircraft dropped bombs on three hospitals.

11.56 a.m.—The following details are now available concerning the bombing operations carried out by our aeroplanes on the 4th inst.:—During the day 24 bombs were dropped on enemy's billets at Hantay, east of Lens, and 30 on billets at Lauwin-Planque in the same area. Five bombs were dropped on Audenarde railway junction (over 30 miles east of Ypres), and seven on Aubigny-au-Bac ammunition dump (seven miles north-north-west of Cambrai) and station of Cambrai. Eight bombs were dropped on Carnières aerodrome, east of Cambrai, and 61 on various other targets.

During the night of the 4th-5th bombs were dropped from an average height of 1,000 ft. as follows:—

Four on a large aerial training school near Valenciennes;

Twelve on Ramegnies Chin aerodrome, near Tournai;

Twelve on Somain (east of Douai) railway junction sidings two of which fell directly on the sidings;

(*Continued on page 761*).

AERONAUTICAL ENGINEERING

SUPPLEMENT TO "THE AEROPLANE"

INCORPORATING AIRCRAFT ENGINEERING, AERODYNAMICS, AND MATTERS PERTAINING TO THE AERONAUTICAL ENGINEER AND THE AIRCRAFT TRADER

The British Aircraft Industry.

BY CHARLES L. FREESTON.

XXVI.—THE WESTLAND AIRCRAFT WORKS.

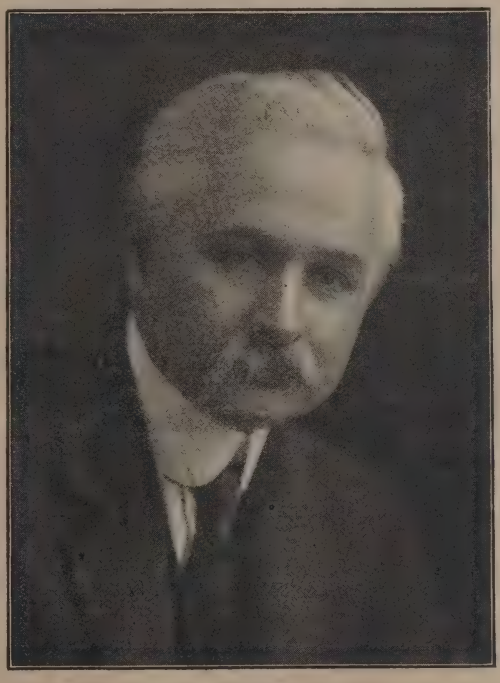
Seldom nowadays does one meet with any reminiscence of a iod earlier than 1896, so far as the evolution of the internal nbustion motor is concerned. But Mr. E. W. Petter, the airman of Petters, Limited, and of the Westland Aircraft orks, Yeovil, and member of the Committee of Management the S.B.A.C., can tell a poignant little story which carries one ther back than the year of the famous "Emancipation Act."

Early Enterprises.

In 1895, to be exact, he and twin brother, Mr. P. W. tter, designed one of the first otor-cars ever built in this untry, with a view to taking rt in the "Engineer" competi- for vehicles with paraffin- iven internal combustion otors.

When the time for adjudica- n arrived, the brothers turned proudly enough with their r, and found that it was the e competitor. In the circum- nces, a walk-over for the 1,000 prize seemed assured, but eir hopes were dashed to the ound when the judges an- nced that there would be no ard, in consonance with a ause in the conditions by which was provided that the prize ght be withheld in the event no vehicle of sufficient merit ing forthcoming.

A Happy Inspiration.



Sorrowfully, the brothers hied emselves homewards with their -fated car, and arrived in eovil two ruined men. They d spent all their capital on the oduction of the car, and, in the ce of their non-success in the ntest on which they had pinned eir hopes, had nothing in hand r immediate needs, and thing to look forward to for e future.

Then one of them was seized ith a happy inspiration. "Let take the engine out," he id, "and turn it into an agricultural oil engine." This was rthwith done, and, as Mr. E. W. Petter remarked to me the her day, "Since then, we have used no other." The phrase ust be interpreted to mean that with this little 3-h.p. single- linder horizontal motor was laid the foundation of a business hich, from 1896 to 1915, was exclusively confined to the produc- on of agricultural and marine motors, and grew into very large mensions, some 15,000 engines having been produced during at period at the Yeovil works, in sizes ranging up to 300-h.p.

A New Site.

In the year 1913 a new site of 50 acres was acquired, to which it was intended to transfer the engineering works *in toto*, but before this plan could be completed the war broke out, and eventually quite altered the aspect of affairs. The original works remain, with an extension in the shape of one of the finest foundries in the West country, but the major portion of the new site has been devoted to the production of aircraft. Meanwhile, the Petter oil engine is in greater demand than ever, and bears out the motto of the firm, which is thus practically expressed:—

"Cheapness in the Petter sense,
Is cheapness born of excellence."

Mr. E. W. Petter.

The Aircraft Business.

It was in the memorable month of April, 1915, however, when Mr. Lloyd George put forth his appeal to the manufacturing classes to come to the country's aid, that the board of Petters, Limited, met to consider the situation, and adopted a resolution by which they pledged themselves to place the entire resources of their works at the service of the Government. Letters were accordingly dispatched to the War Office and Admiralty respectively, inviting a statement as to the form of help which the firm might render.

From the former no answer was vouchsafed, but the Admiralty wrote to ask if Petters, Limited, would undertake the manufacture of aircraft, and added that it was a comparatively simple thing, involving no previous knowledge, and that designs would be supplied, which could be carried out by workers in wood and metal. The firm assented to the proposal, and were then asked to go round one or two aircraft factories in order to familiarise themselves with the processes involved. Visits were paid accordingly to the works of Short Brothers, Armstrong-Whitworth's, and one or two others.

An Invaluable Coadjutor.

By this time it had become patent that aircraft production was not quite so simple a matter as it had appeared at first sight, and the brothers Petter decided to get into touch with someone who possessed a more intimate acquaintance with the practical requirements of the case than themselves. Very fortunately they secured the services of Mr. R. A. Bruce, under whose able guidance most excellent results have been attained.

The Westland Aircraft Works was formed as a separate and subsidiary company, with Mr. E. W. Petter as Chairman, and Mr. Bruce as Director, and the building of Short seaplanes,

under Admiralty contract, was begun as soon as possible. Mr. Bruce, it may be pointed out, was no new hand at the game. He had already had experience of aeroplane construction while engineering manager to the British and Colonial Aeroplane Co., Ltd., of Filton, from 1912 to 1914, and had been actively interested in aviation at a much earlier date; Lieut. Dunne, in fact, while experimenting at Eastchurch, was very anxious that Mr. Bruce should become his manager. Incidentally, it may be mentioned that Mr. Bruce was associated with Mr. Louis Brennan in his monorail experiments, and carried out all the engineering work in connection with that interesting undertaking.

How Naval Inspection Originated.

When the war broke out, Mr. Bruce was acting in a consultant capacity for the Greek Government in respect of an order for Sopwith aeroplanes, and while at the Kingston works he was asked by the Admiralty to become one of the first inspectors of aeroplane production. At that time they had no power of appointment to any such office, but suggested that Mr. Bruce should join the R.N.V.R., and offered him a commission therein, which he accepted. He was then put onto inspection work, as also was Lieut. Stronach, and these two officers really formed the nucleus of what is now, of course, an enormous department.

When Lieut. Bruce, as he then was, received the invitation from Petters, Limited, to join them as director of an aircraft department, he laid the matter before the Admiralty, who considered that he would do good service by aiding production of seaplanes at Yeovil.

Rapid Extensions.

At that time the only building actually erected on the new site was one which was intended to serve the purpose of a machine shop. The original works of Petters, Limited, was situated about 1½ miles away. The Admiralty sent down an inspector to view the new building, and decided that it would be very suitable for the purpose of aircraft production, and by the time Mr. Bruce entered upon his new duties the first contract for seaplanes had just been received.

Mr. Bruce realised that it would be impossible to deal with this adequately without considerable extensions, and these were put in hand forthwith. Suitable plant was obtained in the shape of wood-working and metal-working machinery, and in August, 1915, serious constructional work was begun.

The staff only consisted at that time of Mr. Bruce and Mr. Warren, an architect of Yeovil, who had previously been associated with Petters, Limited, and proved of great assistance in the development of the new venture, both by the display of good business qualities and in connection with the laying out of additional buildings.

Mr. R. A. Bruce.

The First Seaplane.

Meanwhile the main works of the firm had become exceedingly busy with War Office contracts and could spare no men, so that in addition to the erection and equipment of new buildings, Mr. Bruce and Warren had to attract men from outside, and these, of course, had to be trained to the work.

The first seaplane was completed at the beginning of 1916, and from that time the new Westland Aircraft Works began to deliver 225-h.p. Sunbeam-Shorts. A further contract was received for 200-h.p. Canton-Unné machines, and this was followed by an order for Sopwiths, with Clerget engines.

Of more recent orders it is impermissible to speak, as also of an experimental machine of the Westland firm's own design; suffice it to say that the output is increasing and the works have been and are still being extended. They are most conveniently situated, for on one side is the firm's own aerodrome of 61 acres, while on another is a railway siding to which completed goods can be transferred straight from the factory floor.

High-class Machines.

A tour of the works leaves no room for doubt as to the systematic thoroughness of the methods employed in every department alike. The appearance of the completed machines is particularly pleasing, and it is not surprising to learn that the behaviour of the Westland products at the front has received high official recognition, of which I was afforded documentary evidence.

Delays Avoided.

One noteworthy feature of the Westland *ménage* is that nothing is allowed to interfere with continuity of output so long as delay can be humanly avoided. If needed parts are not forthcoming to promise, the firm set to and make them on the premises, and pride themselves on being able to produce anything in the way of spare parts when wanted. As Mr. Bruce remarks, this may not be the most economical way of running a business, but few will deny that it is a sound policy in a time of national stress.

Sound Advice.

The testing methods employed are exceptionally conscientious, while even from the very outset the fact is impressed upon the employees that they are dealing with a class of work in which minute attention to detail is of the highest degree of importance. Indeed, every workman who signs on is handed a printed exposition of wise counsel on the necessity of avoiding bad work, and the terms of this interesting statement may be reproduced herewith:—

"All workmen are warned of the serious consequences of bad work in the construction of aircraft.

"The failure of a comparatively small or apparently insignificant detail may imperil the safety of the whole machine of which it is a component, because in aircraft success is only gained by reducing the weight of every part to the bare minimum for strength, and consequently the whole structure is composed of delicate parts which are easily injured, and the detection of a damaged part is often difficult or impossible except by the workmen who make or assemble the parts.

"All workmen are therefore earnestly asked to point out any defects which they may observe, whether the defect noticed occurs from accidental damage or from errors of workmanship.

"It is pointed out that all reasonable allowance will be made to men who make mistakes, so long as they honestly point them out to their foreman, charge-hands, or managers. Any man who fails to report any defect which comes to his notice may contribute to the maiming or the death of two fellow men.

"Whilst the greatest measure of leniency will be extended to those who accidentally damage work, any man who is detected in attempting to conceal or patch bad work, whether it is his own or another's, will be instantly dismissed. Faults in material must be at once reported, and charge-hands are cautioned that they must be vigilant in detecting them.

"A few examples are given where special caution is needed. The nuts and bolts used in aircraft construction must be tightened with great care, and everyone is warned not to strain them by overtightening. If a bolt is damaged by overtightening of the nut it must at once be removed and the matter reported. In bending metal fittings it is always necessary to look out for flaws or cracks at the edges of the metal, and if such are found the matter must be reported. Shakes or other defects in timber must be carefully watched for and their presence, if detected, pointed out.

"In conclusion it should be recognised that in helping to construct a seaplane each workman is furnishing the country with a formidable weapon, and that whilst by doing his best to work quickly he is helping his country, if any faults due to bad or careless work are allowed to pass undetected, the result of his own work and that of his fellow workmen will be rendered useless or positively dangerous.—R. A. Bruce, Manager."

It only remains to be added that Mr. Bruce is surrounded by a loyal and efficient staff, among whom may be particularly mentioned Mr. Norton, indefatigable in the discharge of his heavy responsibilities as commercial manager, and Mr. Davenport, the chief designer.

On Millimetres and other things Metric.

BY V. P. BENEDICT.

Metric measures have, with the advent and meteoric growth of affairs aeronautical, become of very primary importance to all of us who are concerned or connected with the industry or the Service. For reasons varied, and chiefly because we have in the past been compelled to grant priority in pioneering work to our Allies across the Channel, we now find ourselves forced to labour and to think to a great extent in terms decimal. Similarly, and previously, our importation of the products of French motor-car factories familiarised many of us with their standards of measures.

The metric system was not unknown in this country in those far back times now yclept "pre-war," in fact, the question as to whether we shall or shall not adopt the system as our own legal standard has been under discussion, in true British fashion, for the past half-century. It was before the "talk-shop" as far back as the 'sixties, and has been revived at various intervals since. A Bill was actually proposed in 1907, but failed to pass into law.

Now, while confessing to strong leanings in favour of the universal adoption of the metric system, mine is not the pen nor this the time and place to enter fully into the pros and cons thereof, nor to attempt to enumerate the thousand and one points for and against, for hereby hangs a controversy of 50 years' standing, but one which, in the writer's opinion, will come due for settlement as one of the problems affecting our commercial standing "apres la guerre."

It is, however, worth mentioning, "en passant," that already some 35 or 36 countries have adopted the system, while only three, worth mentioning, have not, viz., England, U.S.A., and Russia. In justice let it be said that on population, taking the British Empire in with England—and Russia likewise—the noes have it by 560 millions, against the ayes 450 millions. At the same time, there is little doubt that since we are such good customers of Uncle Sam, if we were to adopt the system he would not be long in lining up. Trust him. He has already his decimal coinage, to wit, the "almighty dollar" and the "red cent."

Australia, some years back, passed an Act adopting the metric system, but this only becomes operative when England also adopts it. It may almost be taken for granted that when we do so, and many well-informed people consider it inevitable, the rest of the non-metric countries will very soon follow suit, which will give us a universal system of weights and measures and all that such implies.

However, suffice it for the scope of these lines to serve as a skeleton résumé of the origin, the main points in favour, and the application of the metric system to things aeronautical.

The system as a whole, from its very simplicity, is justified in claiming an iota of our time in a brief general review of its ingenuity, and the method by which measures of distance, volumetric capacity and weight are correlated the one to the other.

As we know it to-day, that is, as the French legal standard of weights and measures, the metric system is not the complete scheme as originally proposed. Devised in the troublous years of the Revolution, the intention was to wipe out the divisions of time which belonged to the Christian Era, and to alter the immemorial standard of 360 degrees as the division of the circle.

There were to be 400 degrees of 100 minutes each by which to divide the world's circumference, and 360 days to the year, with 10 hours of 100 minutes to the day, and it was here that the scheme "bust up." The year declined the official request to drop its odd five days, and the French people declined with thanks the ten-hour day, although the authorities tried to enforce it by all sorts of penalties.

Having succeeded in retaining the staid old 24-hour division, the 400 degree circle went by the board because it became unworkable, since mariners found themselves with a combination of 24 hours and 400 degrees which, divided, yields a one-eyed fraction. So they reverted to the 360 degree division, which gives four minutes of time to one degree of the earth's rotation, or 15 degrees of rotation for each hour.

Now although these unworkable portions of the scheme were dropped, the remaining standards, which were based on the 400 degree circle, were retained and adopted. Four hundred degrees of 100 minutes gives 40,000 minutes, and one-thousandth of a minute was taken as the standard for a unit measure and was called a metre. Although, as a matter of fact, not strictly accurate, the metre was meant to be one forty-millionth part of the world's circumference.

To get a unit for volumetric capacity, one-tenth of a metre (about 4 in., English measure) was taken and cubed to give the litre, and taking a litre of pure water at (O) degrees temperature centigrade, the weight of it was obtained and divided into one thousand parts to give the standard unit of weight, which was called a gramme.

Incidentally and apropos of little, our American cousins (?) call the gramme, gram; the metre, meter; and the litre, liter; but this method of spelling is peculiarly their own and does not so figure in the R.A.F. specifications or any others. Still, best be warned in case the standard aero-'bus of the future is the "Ford" of forty meters span, with an engine of 12,000 cubic centimeters capacity (which in some products does not necessarily mean h.p.), and able to carry 10,000 kilograms of dead (very dead) weight (subject to losses en route). Note the catalogue figure is not yet fixed, as Henry is undecided whether to knock two cents off the price and thereby lose a thousand dollars a day of his profits.

However—to our muttons—the three units, the metre, the litre and the gramme, are each uniformly divided and multiplied by tens, wherein lies all the simplicity of which adherents to the system so justifiably boast. To learn the whole system one has to memorise only about six prefixes beyond the three units, or nine items in all, and in commercial use only about half of these are called into service.

Below is given the French boy's equivalent of our own antiquated conglomeration called Tables of Weights and Measures, and on top of the quality of brevity remember that when they learn the tables they have an idea from the learning of the metre and its divisions how much is represented by the litre and by the kilogramme.

When the English schoolboy gets his 12 inches to the foot, three feet one yard business visualised, he is still in the dark when told that eight pints make one gallon, until he is shown the size of a pint or gallon measure, and so with his weights.

TABLE OF METRIC WEIGHTS AND MEASURES.

1/10000th	1/1000th	1/100th	UNIT.	10.	100.	1,000.
Prefix to Unit.				Prefix to Unit.		
Length.			METRE.			
Volume.	Milli....	Centi....	Deci.... LITRE.	...Deca...	Hecto.....	Kilo.....
Weight			GRAMME.			

Here is a unit of length, one of volume, and one of weight, all correlated and each divided and multiplied uniformly, all of which, since the medium of correlation is pure water at a given temperature, can be corrected in any part of the world. In conjunction with a decimal coinage, in which each division is by tenths, calculations, which in English terms are most intricate, become of much simpler character.

Now the ratio of specific gravity for any substance is taken on the basis of water at (O) degrees centigrade as the unit, and since the kilogramme is the weight of a cubic decimetre of water, it is simply necessary to multiply the cubical contents of a given object in decimetres by the figure of specific gravity to obtain the weight in kilogrammes. Obviously, a saving over the English method where it is necessary to first find the weight of a cubic foot of water as an essential factor in the calculation, and then multiply this by the figure for specific gravity and then by the cubical contents in feet.

The metric system owes its simplicity mainly to the decimal basis on which all its sub-divisions are formed. Thus, if you have 752 millimetres you have also 0.752 metres, and 752 metres equals 0.752 kilometres. With English measures, 752 in. is 62 ft. 8 in., or 20 yds. 2 ft. 8 in., and since our rules are in feet or yards, if you want to measure 752 in. you have first to do a bit of arithmetic.

Similarly if a French aeroplane contains 801 nuts of 22.5 grammes each, the total weight (of nuts, not the plane) would be 17,622.0 grammes. Shift the decimal point three to the left (equal to dividing by 1,000) and you get 17.622 kilogrammes, and 100 planes would contain similar nuts to the weight of 1762 kilos., obtained by simply shifting the point.

Try it in English: 801 nuts of 1 oz. each equals 801 ozs., or 50 lbs. 1 oz., and you would need to work it out before you could weigh this amount. One hundred times the amount is 5,006 lbs. 4 ozs. weighed as 2 tons 4 cwt. 2 qrs. 22 lbs. 4 ozs. (If the weight happens to be 1¼ ozs. the job is twice as bad).

And if they were bought by weight—the French at 7 francs per kilogramme—theirs would cost 123.354 francs each plane for the nuts, or 12335.4 for the 100 sets.

At 3s. per lb. ours would work out at 150s. 2½d. per set, to be paid for as £7 10s. 2½d., and for 100—well, 100 times the amount. Work it out yourself, I've lost my slide rule.

Which ought to be enough to show how much more simple are calculations metric than English.

And how many Englishmen (or Britons, if you like the wider term) know their weights and measures thoroughly off by heart? Not ten in the whole country. Every trade has its own weights and all of different values, and so conglomerated that they mostly rely on printed tables rather than head-work.

TELEGRAMS:
"Warings Factories, Hammersmith"

The pound weight was originally the weight of one pint of wheat, and the stone was the weight of a peck. The stone and peck to-day mean different values in different trades, and the whole is a most unholy chaos, to appreciate which it is only necessary to study the market reports of various commodities in the daily papers, which leave one as ignorant of what they ought to convey, as do the official communiqués on aeroplane losses.

For we learn at school that 14 lbs. make one stone, but the butcher does it with 8, which is 6 to the good, and the ounce avoirdupois can be got with lots less grains than the ounce troy. And a peck of peas or a pint of periwinkles are what you get for your money, and not what the table of weights and measures says they are.

The whole of which has much to do with why the Continental youth is better taught than those of this country, and why he, generally speaking, is individually able to make better use of what he has been taught when he comes to commercial life.

Now whether we agree that the Metric System is preferable to our own, or, even if preferable, whether it is worth while going to the cost of changing (estimated at between 200 and 400 million pounds) the fact remains that many drawings of aero-parts and components, practically all those of Continental design and not a few of English, are dimensioned in metres and millimetres, so those of us to whom these represent part of the daily grind will need to know how to tackle the problem of working in millimetres or, in the alternative, how to convert those same into English inches and fractions thereof (decimal fractions necessarily).

There are certain leading factories in this country who make a point of working in French measures entirely (and this quite prior to their advent into the aero-industry), with the exception of odd items such as the holes for bolts, which they dimension in inches, because of suiting English made bolts and screws. Others change all metric figures into English when making their working prints or drawings, and, most extraordinary, but truly English, some firms do both, one method in one branch or department, and the opposite in another.

In still further cases the drawings are left dimensioned metric, and a conversion table is put out into the shops to enable the operatives to do their own converting—another truly English make-shift way of putting liability for error (and an increased liability at that) on the lesser dog. Uneconomical also because every dimension gets converted perhaps fifty times a month, whereas the drawing office could have done it once for all.

To handle metric-dimensioned parts satisfactorily, the best way undoubtedly is to have metric measuring instruments, get a grip of the metric system itself, which ought to take next to no time, and then go ahead metrically.

Instruments, however, are expensive and very difficult to obtain, so where these circumstances render the foregoing procedure unfeasible it becomes necessary to make conversions. For which purpose is printed in this issue a Metric to English Conversion Table, which has been specially compiled to meet the particular requirements of the aircraft industry.

For small accurate parts such as engine components care must be taken to make conversions to at least the fifth place of decimals of an inch. The reason why being that the tolerance allowed is sometimes 0.00025 in. where close fits are required, and unless the fourth and fifth decimal places are accurately taken it is possible to start with an error in excess of the given allowance. When working in metres on wings and fuselages two decimal places of an inch are more than sufficient.

This table is designed to be used for both metres (m.) and millimetres (mm.) since a "bus" is a big thing built up of a lot of little ones. The figures as they stand, with the point in the place shown, are for millimetres converted into inches. To convert metres into inches (which can readily be turned into feet, if necessary), the decimal point is to be taken as occurring three spaces later as shown by the slight gap between the figures.

To use the table for millimetres, the column headed 0.0 contains the English equivalent in inches of the even number of millimetres shown down the left side. These run from 1 to 40, and all tenths of a millimetre from 0.0 up to this figure are shown in the columns, progressing by one tenth at a time to the right. To convert a number of even mm. greater than 40, it is only necessary to adjust the decimal point as shown in the following examples.

For 6.0 mm. take the figure opposite 6 in col. headed 0.0 =0.23622 in.

6.7 mm. take the figure opposite 6 in col. headed 0.7 =0.26378 in.

67.0 mm. take this latter figure and, since 67.0 is 10 times greater than 6.7, move the point one right, which multiplies the result by 10 to agree. =2.6378 in.

278.0 mm. take figure opposite 27 in col. 0.8 and move point one to right. =10.9449 in.

2.78 mm. same figure, but point one to left (ten times less). =0.10944 in.

275.0 mm. take 2.75 mm. and move the decimal point two places to right since it is 100 times less than the figure required.

or take 27.5 mm. and move the point one place right.

The examples show how wide the range of the table as stands. Every likely conversion can be handled as in the high figures, the small fractions are rare and unnecessary, and ov 400 mm. anything more odd than 25's, 50's and 75's, which a covered by the table, are not likely to be met. It will fr quently be found possible to get a double check on the conversi figure as in the case of the example given above of 275.0 mm which can be taken either on 10 times the figure for 27.5 or 1 times the figure for 2.75.

For the conversion of metric measures, other than those length, which are covered by the table, the subjoined schedu of conversion factors will be found of use, and will cover any ne likely to arise. It is not always necessary to work to the fi number of decimal places given, but the accuracy desired mu govern the factor used.

THE AMERICAN N.P.L. AND ITS WORK.

The national advisory committee for aeronautics has issued t following notice:

At a recent meeting of the sub-committee on power plants the national advisory committee for aeronautics, preparatio were made for the development at the Bureau of Standards of laboratory for testing aircraft engines under conditions of al tude and temperature similar to those encountered in flights at altitude of 20,000 feet or more. The laboratory and its expe mental equipment will be organised under the auspices of t advisory committee, and the investigations will be directed by t sub-committee on power plants.

The special immediate purpose of this proposed equipment is t prompt testing out of the so-called "All American" aeropla engine, now under development, in order to be able immediately put it under controllable conditions corresponding to any altitu and any atmospheric condition which would be met in the air.

[An interesting scheme, but it must be remembered that wid differing results are obtained from an engine on the test-ben and in an aeroplane, and it is sincerely to be hoped that no tempt will be made to standardise the engine before it has be fully tried under actual flying conditions.—Ed.]

AERO-MOTORS
IN KIND AND CONSTRUCTION

By Geoffrey de Holden-Stone.

Two-stroke Designers.

Much research, more trial, and most of all profitable things, the ever-instructive error, have convinced me that there are really only two kinds of persons who are competent to design a first-class and original two-stroke motor. One is the trained engineer, of such long experience and scientific insight that he has not only learned to recognise the utter limitations of conventional design and practice, to despise them, and refuse to be fettered by them, but to trust rather to his trained instincts concerning any new problem, and of mechanics merely as a case of tools to realise those instincts, never as a ruling factor in his equation. Then, when the time comes he will be the more certain to choose the right set of tools, the *mecanique juste*.

The other is the amateur who has merely grasped the essentials, and is not mentally encumbered with the habit and practice of the shops; and so, not being encouraged by these to imagine he knows more than he does, is free to set out on an independent career of research. He will probably—and rightly—dwell upon physical rather than mechanical aspects, and so get into the habit of making the latter fit the former. In that way, after a few blunders, he will probably commit one of those startling originalities that achieve master-patents and much distinction, and in any case he will go far. Four such men, I remember, all absolutely innocent of shop-training or anything like an engineering qualification, between them managed to design one of the most efficient road-racing motors ever produced, the four-cylinder Y-type monobloc Peugeot, of the Circuit de Boulogne. One of them was its driver, the late Georges Boillot.

Both, need I say, must be idealists on the basis of those essentials, the only things that matter.

An Original Design.

One of the latter kind, I take it, is Mr. Bruce Harding, of Belsize Park and the Barbican, whose two-stroke designs, both of 1910 and 1914, are not only distinctly original as mechanical propositions of unusual simplicity, but show him to be one of the soundest physicists who has worked in the two-stroke cycle. Hence, certain peculiar mechanical merits have resulted, in either case. The later model, too—illustrated herewith—possesses so many features of appropriate quality for aviation purposes, that it cannot be overlooked at a time when discovery of the most efficient aero-motors is so sought: all the more that such discovery has hitherto been so actively discouraged in Whitehall and Cockspur Street.

Both models, however, when built, not only started from the first shot, but kept on running. Now when any two-stroke consents to start and run at all, it shows that its scheme is capable of working and that even if it presently stops, the elimination of its defects is mostly a matter of investigation: that even if this involves partial re-design, mechanically, the basic principles can generally be retained. If, on the other hand, it keeps on running, then the complete success of the working scheme becomes chiefly a matter of refinement.

Still, however good as a demonstration of principles, all sorts of mechanical objections may arise. The design may be very nice and simple indeed, and it may have shown up as well on the test bench as it did in the drawing office; which are the two extremes of the proposition. In between it may be too costly or delicate: a brute in the pattern-shop and foundry, and a tricky affair in the machine shops.

So one is sorry to say that the first ideal in two-stroke practice to be served is that of popularity in these places, where they prefer to be plain artisans rather than conjurers, as they probably get all the impossibilities they want at home. Duly served, this will generally bring the second one out all right, which is that of mere £ s. d.: while third by a long way, come all such ideals as valvelessness and the physical and mechanical artistries: to lose which, nevertheless, is to lose the soul of the matter.

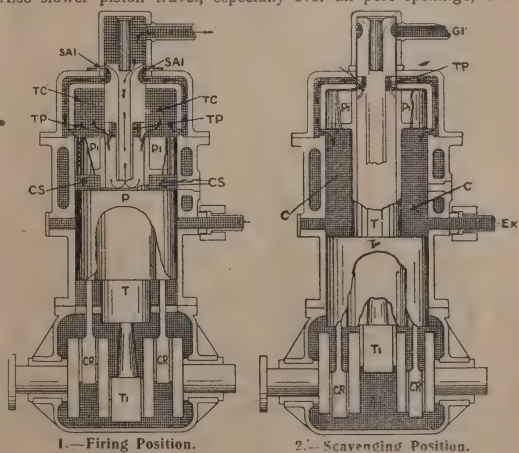
As in 1910.

Thus the original 1910 Harding model, though embodying many desirable results, left something to be desired in the embodiment. As will be seen, its mechanical part consisted of two pistons coupled to opposed cranks at 180 deg. in a common cylinder, the explosion taking place between them; but the cross-shaped trunk of the upper piston moving through the body of the lower one, while its upper extension—likewise hollow—served in the fourfold capacity of induction trunk for the mixture, for the air-scavenge, as an internal cooler for the motor, and as a mixture heater at the same time.

These two latter functions constituted the heart of the system, physically, the two former being merely mechanical means. And finally, it will be noticed that a plug-piece depended from the top of the induction-extension of the cylinder, corking up the trunk during the outstroke, like a bottle after being filled.

At the top there was the port G.I. (gas intake), just below, another circular series S.A.I. (scavenging air intake): a plug entry at C.S. (combustion space); and a ring-series of exhaust ports at the bottom. So one sees that the latest-recognised canons of port relations were duly recognised by Mr. Bruce Harding seven years ago!

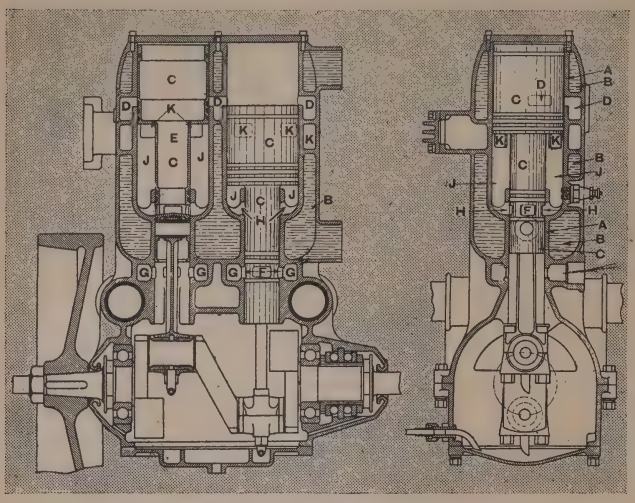
How the Cycle Worked.



The working cycle went as follows. On the instroke, the back of the upper piston created a strong suction pressure in the upper port of the cylinder. This, when the piston went down on the instroke, would be relieved as soon as the plug cleared the top of the trunk; and the mixture would rush down the trunk, *not* into the combustion space, but into the hollow of the piston head and the upper part of the cylinder, by way of the transfer ports (T.P.) in the middle of the trunk. But just previously to those ports uncovering, the waisted top of the trunk uncovered the air ports, and a supply of air rushed in over the waist into the outer transfer channel at the top of the cylinder, and was retained therein by the wall of the piston extension.

This left the air charge in the lead for entry. Then on the outstroke the upper piston first corked its trunk at the top, and also closed off the air-intake ports with the wall of the upper trunk extension: at the same time driving over the mixture—as the right-hand diagram shows—into the annular transfer chamber—where the air was—as soon as the middle trunk ports coincided. But this action previously drove the air ahead of the mixture, and into the combustion chamber, as soon as the piston head lifted clear of the ports at the bottom of the transfer duct; to scavenge the exhaust ahead of the new charge. Then the charge came in, was duly impoverished with the residue of the air; was compressed and fired, between the pistons; all the induction previously described, occurring at the same time above the upper piston.

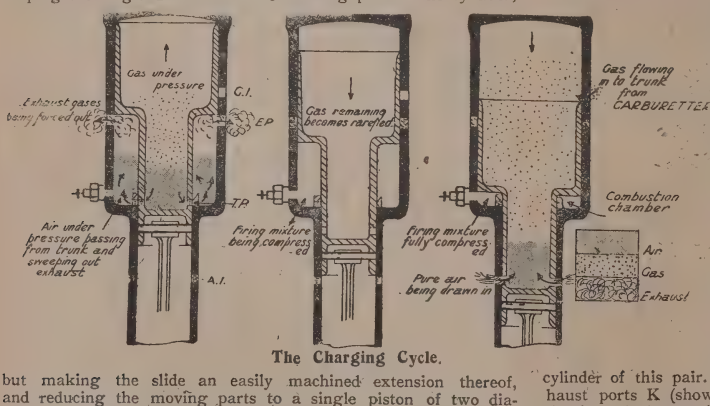
But—there was a lot of it! With such a long central trunk, that upper piston could only have a very short connecting rod. And it had to have rings on its fingers and again rings on its toes for the slide through the lower piston, which also required two machinings. So far as mere material went, the construction would be cheap enough. But manufacturers—who really spend more on valve-gear than apparently occurs to them—*will* have a more open tooling proposition than this design offers.



Special Advantages; and Certain Defects.

All this was excellent. There was the supreme physico-mechanical advantage of the balanced two-way explosion effort. Also slower piston travel, especially over all port openings, and

1.—Firing Position. 2.—Scavenging Position.



The Harding Two-stroke Motor, 1910 Model.

The Harding Two-stroke Motor, 1914 Model.

withal more than double the port areas usually available. Again, variable compression from the top: the working cylinder of the same bore throughout; complete pressure relief; a clear combustion space, no baffles, pockets or deflector plates; and above all, *internal* cooling. Also, the air induction being positive in volume—there being no valves—and once set, unvarying, the carburettor could be likewise set to a richer mixture, with a correspondingly reliable supply.

So while keeping the general principle of the original cycle—and especially the internal cooling and mixture heating effect of that central trunk, its most valuable physical feature—Mr. Bruce Harding in 1914 remodelled the mechanical scheme of the design, keeping the single diameter of the working part of the cylinder,

The Charging Cycle.

but making the slide an easily machined extension thereof, and reducing the moving parts to a single piston of two diameters with the central trunk: rather shorter.

The Change of Design.

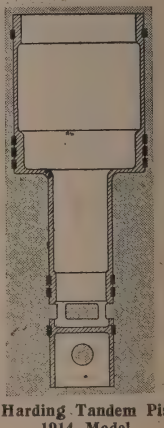
Thus he was enabled to lengthen the connecting rod, almost to double its length: and by closing the trunk at the bottom permanently, and bringing the air ports to the bottom (as at G, Figure 2), he was able to make one set of ports F in the trunk C serve first as air intake ports on the instroke—which is the outstroke of the trunk—and then as transfer ports for the final induction into the annular combustion chamber J; instead of two sets as before.

These changes obliged—and at the same time enabled—him to shift the exhaust ports from the bottom to the top of the combustion chamber: thus not only maintaining the canon of remoteness from the induction, but getting a better position for the more readily automatic upward flow of the lighter exhaust gases.

It will be seen, just here, that except for the dwell and rebound of primary induction, he practically succeeded by this rearrangement of relative port positions, in getting a uniflow motion for the gas stream; which, so far as I know, has only been done in two other instances in two-stroke practice, one of them in a very recent patent—and once only—in the Gnôme—in four-stroke history.

Withal, throughout the same advantageous result of extensive port area—actually threefold in the case of the exhaust and induction—on a ring series, was retained in the new design; fortunately enough, as the speed of the single working piston would naturally be doubled.

And the Results Thereof.



The balanced explosion effort, of course, had to be relinquished: but it will be seen that one of its advantages—that the cylinder is unaffected, not forced off the crank-chamber, but remaining as a mere piston-guide—was practically retained; as the combustion head of the cylinder is actually at the bottom! This, too, has a special physical advantage in regard to the water-cooling; for thermo-syphon cooling can be employed, without its usual disadvantage that the hot water lingers too long about the heads; whereas in this case, they are bound to get the first flush of cold water as it enters. On the other hand, we now notice the radical mechanical difference between this construction and any other single-piston design; this being that the trunk—and hence the connecting rod—is in constant *tension* during the combustion effort. Naturally, therefore, all the strains are finally transmitted to the *threads* of the cotter-bolts on the big ends. Consequently it would appear that the only practical—nay essential—specification here, is that the big end should be a complete unbroken ring or barrel formation; with the crank built up.

Finally, as to construction, instead of the duplicated-top pattern of the 1910 cylinder—an awkward bit of casting, simple as it looks—the suction base was reduced to the simple plate we see screwed to the top of the open cylinder casting; which, with relief plugs round the passages, is an easy enough foundry job. Particularly, too, will the copious water-jacketing of the exhaust ring, above and below, be noticed.

How the New Harding Cycle Works.

From all this, the differences in the working cycle of the 1914 model—which is the same to-day—will become more readily apparent. In the sectional side-elevation the pot-shaped left-hand piston—much deeper than the old one—will be seen at full outstroke. Beneath, it has just exhausted. Above, it is recompressing the charge for the final induction. But ahead of that induction of the charge, the trunk below—now at full *instroke*—is admitting the charge of air it had previously picked up and bottled—through the ports G at full outstroke—into the annular combustion space J, under pressure, to scavenge the exhaust.

Let us now suppose the exhaust relief to have occurred, and the transfer of the charge down the trunk into the combustion space to have been completed. The charge is then compressed to the bottom, and fired, at the end of the piston's instroke, which is the outstroke of its trunk. This is shown in the right-hand cylinder of this pair. The pot of the piston has cut out the exhaust ports K (shown in dotted lines), and the trunk, the inlets to the combustion chamber. Also the previous induction acting through the trunk wall, has helped to cool the combustion space; and the trunk itself—radiating internally as a "hot spot"—has usefully warmed the mixture.

The Harding Tandem Piston, 1914 Model.

But simultaneously, with this instroke, a rarefaction or partial vacuum, and hence suction, has been created throughout the interior of the piston and trunk. There are two ends to it, of course. So, as soon as the piston is at full instroke and the trunk at outstroke, the mixture inlet ports D, from the figure-of-eight induction passage, and the air inlet ports G (coinciding with F) are simultaneously opened. So the mixture rushes inwards and

The Harding Two-stroke 1916 Eight-cylinder Aviation Model.

downwards, the air inwards and upwards: and there they stay bottled and stratified, during the whole of the firing-stroke. But, of course, the air at the bottom remains in the lead for entry and scavenge, just as in the 1910 type. It should be noted, too, that the figure-of-eight shaping of the induction passage—a rare achievement, only embodied in the "Sans" design of April, 1910—has the special advantage of continuous circulation without backlash; and thus steadies the carburation.

The Aviation 1916 Model.

The V-type, 1916 model, for aviation, merely repeats this working cycle. The only difference is the structural one, that it is air-cooled, and that single ports instead of annular-port passages are used: though there appears to be no reason for the change, and several against it. Otherwise its advantages—additionally to the useful counter-balancing of parts as a V-type, remain the same. As a manufacturing proposition—as well as for maintenance—this 1914-16 design, however, is obviously far ahead of the older one. For one thing there are only three moving parts per cylinder unit; piston-body, rod, and crank: and these can be removed without disturbing the motor-mass, as the gudgeon pin can be punched out from beneath, through the air port, near the bottom of the trunk outstroke. Obviously, too, all the previous physical advantages already dealt with remain; such as the controllable air-setting for the scavenge; which equally serves for the day-to-day tuning adjustment for the carburation. In running, too, this motor displays uncommon flexibility, throttling down to 200 r.p.m. and keeping steady at that rate, yet accelerating in a few seconds to a full 1,500 r.p.m. and over. And slight as it might appear, the active charging volume of the annular combustion space is unusual; practically twice what anyone would imagine until they had measured it.

Altogether, with its internal cooling after each stroke, it appears to be one of the half-dozen best and simplest of the two-stroke cycles extant. And a working example has been ready since some months before the war!

(To be continued.)

A NEW INDUSTRY—AERO COVERINGS, LTD.

This is an age of specialisation and division of labour. No more does the patriarch build his own dwelling, construct his own plough, and weave the coat of many colours for the spoiled son. Now the proud head of the family consults an estate agent for someone else's cast-off home, earns his living with a fountain pen, which is probably the work of forty machines and fifty people, and clothes his somewhat meagre family with garments bought in Bond Street and manufactured in East End Slums, only, as a rule, the girls receive most of the multi-coloured garments.

The division of labour is but a sign of the times, and one is not surprised to announce a new specialised industry in connection with aviation.

For a considerable time past manufacturers of aeroplanes have experienced inconvenience and loss of time and the waste of a great deal of highly-valuable workshop space in the covering, doping, and varnishing of the wings and control planes of the machines they construct, to say nothing of the expense of fitting up elaborate fans and other ventilating plant to conform with Home Office regulations.

In the first place, the best organised aeroplane factory experiences considerable difficulty in keeping its fabric shops steadily employed, because the amount of work which can be done is governed absolutely by the output of the plane-erecting shop, and the works manager is confronted with the choice of keeping many hands idle at irregular periods, or of constantly discharging and re-engaging them—both most unsatisfactory alternatives.

Also, the fabric and dope shops occupy a considerable amount of floor space, which the average engineer would prefer to see occupied by machine tools, turning out work nearer to his own heart.

The carrying out of the Home Office health regulations in the dope shops are difficult of achievement in many cases, and the problem of keeping large shops at the necessary degree of heat is often considered a bugbear.

Many voices cry vainly in the wilderness, but the demands of the engineer-aircraft manufacturers, who regard the sartorial requirements of aeroplanes with something approaching *ennui*, have been heard.

A company, called "Aero Coverings, Ltd.," has been registered for the purpose of taking the fabric work entirely out of the hands of those aircraft manufacturers who may find difficulty in doing it for themselves.

Works have been installed at Kilburn, and equipped in a remarkably short space of time, production already having commenced.

The plant includes some ingenious devices which it is well not to describe in print, and needless to say the ventilation arrangements have been made to conform to Home Office requirements, and the heating according to Aeronautical Inspection Department regulations.

The directors of Aero Coverings, Ltd., are experts in all that pertains to aeroplane fabric, dope, and varnish, and are qualified to produce aerofoils covered, doped and finished in a highly workmanlike manner. The plant is in the charge of a qualified engineer, and the installations laid down in the last few weeks are evidence of his ability.

The new firm undertakes to collect from aircraft manufacturers, wing frames, tail frames, elevator frames, etc., as passed by the A.I.D., and to return them ready for the riggers.

To save valuable time, the fabric is stitched into bags by electrically-driven sewing machines, and fitted and sewn over the frames by hand.

In the doping department the plane is carefully weighed during the various stages so as to regulate the amount of dope and finishing materials present to A.I.D. requirements. Identification marks and stencils are added, and the job weighed before leaving the factory.

Each operation is checked by an A.I.D. inspector, and every completed unit is delivered to the manufacturer with a certificate showing the weight of the section, the weight of the fabric, the weight of the dope, and the weight of the finishing materials applied thereto.

Incidentally, the tautness of the fabric is checked during the various stages by a recording instrument, and particulars given on the same certificate.

One is pleased to record the decision of the proprietors to place for the period of the war any inventions or labour-saving devices which they may discover in connection with plane covering at the free disposal of the aircraft industry, as a patriotic offer which may assist the more rapid output of aircraft.

All work is collected from and delivered to aircraft manufacturers by the firm's motor lorries, and orders for large or small quantities of planes, in complete sets, or as spares, can rapidly be dealt with. In many cases spares will be delivered back, completely covered, doped, etc., within two days of their collection.

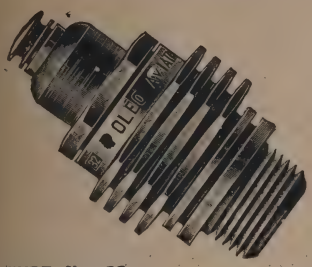
Aircraft constructors, more especially those who have not yet erected their doping works, are invited seriously to consider whether they cannot appreciably increase their output and cut down their working costs by handing their fabric work to this new firm of specialists.

Enquiries should be addressed to Aero Coverings, Ltd., Tennyson Works, Willesden Lane, London, N.W.

A RESIGNATION.

The Grahame-White Aviation Co., Ltd., announces that Mr. F. H. Payne has resigned his position as Director of the Company, and that Mr. Claude Grahame-White is now the sole Managing Director.

THE R.A.F. SPORTS.

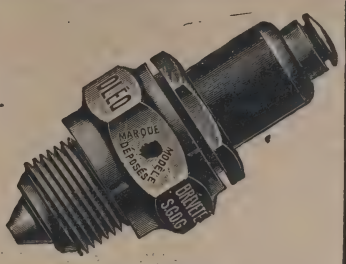


The first annual sports' meeting of the Royal Aircraft Factory was held at the R.A.F. Sports' Ground at Farnborough, in aid of the R.A.F. Benevolent Fund, on Saturday, Sept. 1st, under the patronage of Sir William Weir, of the Air Board, and the presidency of Mr. Henry Fowler, superintendent of the Factory.

The preliminary heats for many of the events were run off earlier in the week, a commendable arrangement which might be followed at other sports' meetings, as the interest of the spectators is not tried by watching numerous eliminatory events.

The programme included races and competitions suited to the abilities of young and old, and a very large entry was received.

A somewhat unusual feature was the admission of several competitors whose names were not printed on the official programme, but doubtless the additions were made with the sanction of the A.A.A.



Music was furnished during the sports by the band of the Royal Flying Corps, and dancing followed to music by the Aerial Orchestra.

MARKET REPORTS.

Prices given are for quantities on usual terms.

Sept. 6th, 1917.

COPPER.—The dullness of this market continues and buyers are holding back. This was foreshadowed in previous reports and is due primarily to the delay of the U.S.A. Government fixing the official prices at which Copper must be supplied. The labour situation there is a little more promising and the outlook is hopeful. At the same time the accumulated stocks have been considerably reduced. The prices here remain unchanged and supplies are fairly well maintained. One is still inclined to think that there must be a further slight reduction in the official prices.

Current Prices.

Standard Copper Ingot .....£120 per ton, Cash.
Copper Sheet .....£160 per ton.
Copper Tubes, S.D. ..... 19¾d. per lb.
Brass Sheet, 24 Gauge ... 15⅝d. per lb.
Brass Tubes, S.D. ..... 16½d. per lb.

TIN.—Since last week's report the Tin market has recovered a little and appears to be showing signs of gaining a healthier condition.

The demand has been very brisk, and supplies are coming forward fairly well.

An order was issued on August 24th, 1917, by the Ministry of Munitions, controlling the supplies and prices of Tinplates and Terneplates. There are many extras for special sizes, different packing, etc., etc., also several allowances. These can be ascertained upon referring to the order, which can be procured from the Director of Steel Production, Ministry of Munitions of War, Whitehall Place, London, S.W.1. The maximum official prices are given below; Staffordshire Tinplates are excepted.

Per Basis Box. Net. 20 B. Maker's works or nearest station.

Coke Tinplates.

I.C., 20 by 14, 112 Sheets, 108 lbs. .....30s.
D.C., 25 by 17, 50 Sheets, 94 lbs.....29s.
S.D.C., 22 by 15, 100 Sheets, 163 lbs. ...45s. 6d.
28 by 20, 30 by 21, 19¾ by 14, 18¾ by 14, at basis price for 20 by 14.

Terneplates

28s. per basis box, i.e., 2s. below the basis price of Coke Tinplates.

These prices are based upon Tin at £240 per ton for Coke Tinplates, 1⅛d. basis to be added or deducted from the basis price for each rise or fall of £5 per ton above or below this price, and 1⅛d. basis to be added or deducted from the basis price of Terneplates for each rise or fall of £20 per ton above or below this price.

Merchants are permitted to sell from their own warehouses at a maximum addition of 7½ per cent., plus carriage, or 2 per cent., plus carriage, if sold for delivery from maker's works.

Sept. 3rd	£243	5	0	per ton.
August 30th	244	0	0	per ton.
August 27th	241	5	0	per ton.
August 4th	245	10	0	per ton.
Highest Price, 1916	205	0	0	per ton.

LEAD.—This market lacks any interest whatever. The shortage of supplies continues, and it is only possible to obtain metal for work of national importance. Official prices continue unaltered.

Current Official Prices.

Lead, Virgin Pig .....£29 per ton, Ex Ship.
Lead, Virgin Pig .....£30 per ton, Ex Stores.
Lead Sheet .....£39 10s. per ton, Deld. U.K.
White Lead, Dry .....£46 per ton, Deld. U.K.
White Lead, in Oil, £53 to £55 per ton, Deld. U.K.
Red Lead .....£42 per ton, Deld. U.K.

STEEL.—The demand for all classes of Steels continues undiminished. It is, in fact, ahead of the increase in output. The later is, however, making great strides.

Manufacturers are anxiously awaiting the official prices for the Aircraft Steels at present being controlled by the Air Board.

One understands that the Ministry of Munitions is carrying on negotiations with the Sheet Iron trade, with the object of controlling prices, and presumably the Sheet Steel trade will shortly receive the attention of the Controllers, and probably prices will suffer the now "usual" inflation. Consumers are learning to anticipate this inevitable inflation by looking ahead. Prices of Bar Steel are the prices which were ruling prior to the material being controlled. One knows of no reason why they should be advanced.

Current Average Prices.

R.A.F. 3B Steel 78s. to 80s. per cwt., Basis. (Black or Blue Reeled.)
R.A.F. 1E Steel, 36s. to 40s. per cwt., Basis. (Black or Blue Reeled.)
R.A.F. 9A Sheet Steel, 30s. to 32s. per cwt.

ALUMINIUM.—Prices are still unaltered and supplies are quite satisfactory.

Official Prices.

Ingots .....£225 Deld.
Remelted .....£210 Deld.

TIMBER.—There is nothing very special to report this week. The general position continues very acute.

Small parcels of wood are occasionally offered, but this is becoming a thing of the past, and when such an event does take place, the first consideration is not price, but quality, and aircraft firms are now taking wood which they would not have looked at 18 months ago, in the hope of getting a percentage of Timber which will pass the "Cast Iron" inspection of the A.I.D.

Walnut is still very scarce, although one hears of several loads having been recently received. There have been several shipments of Mahogany received recently, but the outlook is far from being bright.

Current Average Prices.

Silver Spruce, 17s. 6d., c.f.
English Ash, 13s. 6d. to 15s., c.f.
Walnut, 2s. 3d. to 2s. 6d., s.f.
Mahogany, 2s. 2d. to 2s. 4d., s.f.

Prices include selection and delivery.

FABRIC.—There are no further remarks to make on the atrocious prices being charged for the materials under this heading. One learns that the spinners are up in arms against the Air Board on account of the unprecedented prices they are demanding for Flax. This state of things is certainly not conducive to maximum output, and, although supplies are at present satisfactory, the Irish spinner is the wrong man to upset.

Official Price.

17C Cloth, 2s. 8d. per yard, 36 in. wide.

THE PATENTS INDEX.

The subjoined list of recent inventions has been specially compiled by The Aeroplane from the current Official Patents Records.

Patent Applications.

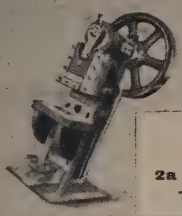
Baker, F. C. Means for preserving buoyancy of observation balloon in the air, and retain the gas when valving. No. 12522. August 31st.
Bramwell, F. H. Observation apertures for aircraft. No. 12534. August 31st.
Calthrop, E. R. Parachutes. No. 12483. August 30th.
Cox, F. H. Apparatus for ascertaining range for dropping bombs from aircraft. No. 12506. August 31st.
Danielson, O. A. Indicating device for aircraft. No. 12279. August 27th.
Downing, A. E. Flying-machines and engines therefor. No. 12325. August 28th.
Drummond, W. J. Toy aeroplane. No. 12496. August 31st.
Edde, H. Motors for aircraft. No. 12302. August 27th.
Grice, S. H. Clinometer for aircraft or submarine. No. 12254. August 27th.
Groves, S. E. Dopes or varnish for aeroplanes. No. 12349. August 28th.
Holland, H. W. Release mechanism for dropping bombs. No. 12422. August 29th.
Houghton, P. H. Propellers for aircraft. No. 12311. August 28th.
Lytton, E. Levels for aircraft, etc. No. 12504. August 31st.
McAlpine, G. L. Guns carried by aircraft. No. 12551. August 31st.
Mooney, D. J. Metal construction for aircraft. No. 12406. August 29th.
Smith, M. Bevan. Anti-gravitation level for aeroplanes. No. 12309. August 28th.
Sykes, H. W. Guns for use on aircraft. No. 12586. Sept. 1st.
Tarrant, W. G. Struts for aircraft. No. 12416. August 29th.
Tate, B. J. Rigid observation balloon. No. 12246. August 27th.
Touboul, E. W. Toy aeroplane. No. 12470. August 30th.

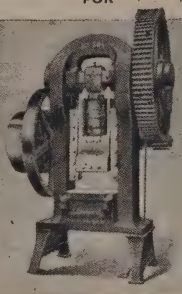
Complete Specification Accepted, prints of which can be obtained on and after September 20th, 1917.

108,893. August 24th, 1916. Mills, E. W. Sighting apparatus for use on aircraft.

Abridgments of Recently Published Specifications.

107,662. Aeronautics. Chapman, F. W., 2, Dunstable Road, West Leagrave, Luton, Bedfordshire. July 17th, 1916, No. 10019. [Classes 4 and 20 (ii).]





Adjoining members of light structures such as aeroplanes and hangars for aircraft are connected together by means of a thin plate having, on one or more sides when bent into its final form, a recessed lateral groove in which a wiring plate is adapted to

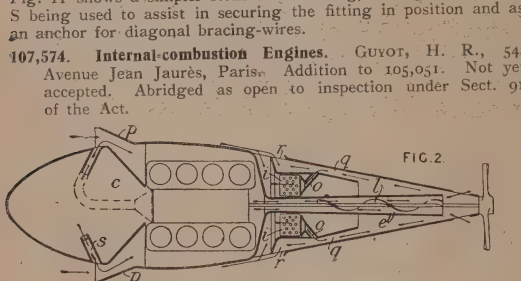
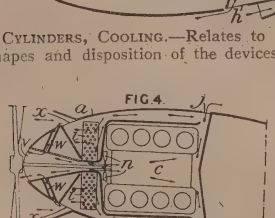
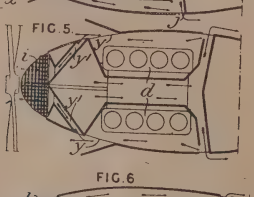
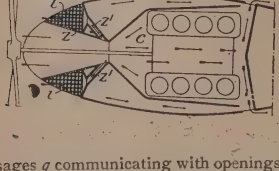
fit and be secured thereby. Fig. 5 shows one form of the fitting for use on the longeron of an aeroplane, and Fig. 2 the same in position. The longeron A is stayed by struts B, C, and by bracing-wires secured to wiring plates D, only one being shown in position. The fitting is originally stamped from flat plate, and after being bent to its final form is fastened by the lugs F, G. The walls H are bent up to form partial or complete sockets, as shown for the struts. Grooved recesses J, K, are formed along the base of the sockets and in these recesses the shaped wiring





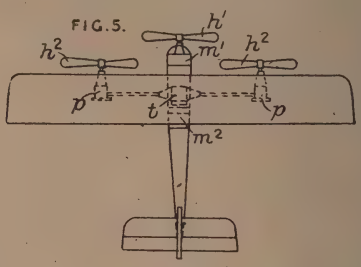


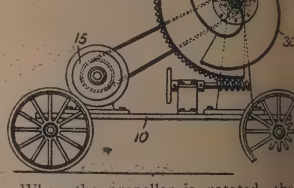
plates D, Fig. 3, are held, a corresponding groove being made in the ends of the struts. Diagonal bracing may be attached to the lugs F, G. Various forms of wiring plates are described. Fig. 11 shows a simpler form of the fitting, a diagonal eye-bolt S being used to assist in securing the fitting in position and as an anchor for diagonal bracing-wires.



107,574. Internal-combustion Engines. Guyot, H. R., 54, Avenue Jean Jaurès, Paris. Addition to 105,051. Not yet accepted. Abridged as open to inspection under Sect. 91 of the Act.

Cylinders, Cooling.—Relates to various modifications in the shapes and disposition of the devices for cooling aircraft motors described in the parent Specification. In the pusher type of aeroplane shown in Fig. 3, air enters the motor chamber *c* through an opening *b* and is discharged through a passage e^1 having the form of a double cone. The radiator *i* is cooled by air which enters openings *h* and passes through tubes *o* leading to the passage e^1. The radiator may be further cooled by external tubes *t* arranged to draw air through tubes *u*. In the modification shown in Fig. 2, air enters the motor chamber *c* by passages *p* arranged to cause a withdrawal of air from tubes *s*. A quick-threaded screw *l* is secured upon the propeller shaft to increase the flow of air through the passage e^1. Air pipes *o* running from the radiator *i* lead to passages *q* communicating with openings *r*. In the tractor type of aeroplane shown in Fig. 4, air enters the motor chamber *c* through a conical passage *v* and leaves the shell *a* by openings *j*, the flow of air being increased by a fan *n*. The radiator *i* is cooled by air entering passages *w*, *x*. In the modification shown in Fig. 5, the radiator *i* is arranged at the front of the apparatus, and the hot air from the radiator is drawn off through tubes y^1 communicating with inlets *y*, through which air enters to cool the cylinders *d*. In another modification, the hot air from a conical radiator *i*, Fig. 6, passes through tubes z^1 to a conical passage *z* leading to the motor chamber *c*.





107,573. Aircraft. Soc. des Moteurs Salmson (Systeme Canton-Unne), 9, Avenue des Moulineaux Billancourt, Seine, France. Not yet accepted. Abridged as open to inspection under Sect. 91 of the Act.

Propelling.—An aeroplane or airship has two motors arranged in the longitudinal axis of the aircraft, one motor driving directly a screw propeller in that axis, and the other driving two side screw propellers arranged symmetrically. Fig. 5 shows an aeroplane having two motors m^1, m^2, the motor m^1 driving a propeller h^1 direct, and the motor m^2 driving two propellers h^2 through gearing *t*, *p*. The motor m^2 may have a transverse shaft and occupy the position of the gearing *t*. All three propellers may be arranged in front of or behind the main plane, or the propellers h^1, h^2 may be on opposite sides of the plane.

107,627. Propelling-devices. Schmelzer, B., 47a, Jefferson Avenue, Jersey City, New Jersey, U.S.A.

Comprises a propelling-device of the kind in which a propeller or fan is located within an adjustable casing and by means of which motion may be imparted to a vehicle whether upon the surface of land or water or in the air. A propeller consisting of a pair of conchoidal vanes 30, shaped as shown, is mounted within an adjustable casing 22 and rotated by chain or other gearing from an electric or other motor 15 carried by a platform 10. The casing 22 is adjustable by worm-gearing and it extends beyond the centre of the propeller, as shown. When the propeller is rotated, the thrust on the casing propels the vehicle. An opening covered by a slide may be formed in the casing to enable the vehicle to be controlled. For elevation in aircraft, the casing 22 is disposed vertically over the shaft of the propeller.

AMERICAN INDUSTRIAL NOTES.

A measure of vital importance to aeronautics has been proposed at Washington by Representative Hulbert, of New York, who introduced into the House a bill to remove the restrictions on advance payments imposed by Section 3648 of the Revised Statutes of the United States, or any other Act, as they apply to the expenditure of appropriations contained in the bill recently passed authorising the expenditure of 640,000,000 dols. for the increase of the Aviation Section of the Signal Corps.

Section 3648 prohibits the advance of the public moneys on contracts, etc., and the measure now under consideration is designed to permit the War Department to make such advances to responsible manufacturers, in order to enable them to increase their facilities for the production of Government aircraft. Many manufacturers of aeroplanes not only have valuable designs and patents, but would be in position to turn out aircraft on a large scale if they had the funds to increase their facilities.

* * *

The International Aircraft Standardisation Committee, organised by the Allied Governments to affect standardisation of the metal entering into the construction of aeroplane parts, as well as the parts themselves, held their first meeting in New York, Aug. 7th.

* * *

The Aircraft Production Board is devoting its energies to the perfection of its organisation, pending the passage of the bill giving the Board a legal status. Chairman Coffin has been in the West the past few days conferring with automobile and other industrial concerns.

The Board has moved to the old Southern Railway building opposite Union Station, where two entire floors have been taken over. Ultimately the entire building, containing several hundred rooms, will be utilised.

(*Continued from page 728*).

Seventeen on Mouvèaux and Lezennes aerodrome, near Lille;
Six on sidings between Douai and Somain; and
Two on Ledeghem railway station, south of Roulers.

9.28 p.m.—On the 5th inst. there was again great activity in he air. The enemy on several occasions interrupted the work f our artillery machines and attacked our aeroplanes employed n long-distance bombing raids. A few bombs were dropped ehind our lines by hostile machines during the night, little amage being done.

During the day our machines dropped eight bombs on railway idings near Ghent, five on a large shed at Maubeuge, 54 on illets round Douai, 38 on aerodromes east and north-east of ambrai, and 61 on various other targets.

During the night 10 bombs were dropped by our aeroplanes n aerodromes near Courtrai, eight on an aerodrome east of ille, and 28 on other targets.

In air fighting yesterday five enemy machines were brought own and five others driven down out of control.

Three of our machines are missing.

The casualties caused by hostile air raids on the night of the th-5th inst. include 80 German prisoners of war, of whom 37 ere killed and 43 wounded by bombs dropped by the enemy's eroplanes.

SEPT. 7th, 9.4 p.m.—On the 6th inst. bad weather caused a iminution of the great aerial activity of the previous two days. certain amount of bombing was carried out during the day, nd over 100 bombs were dropped on various targets.

Two enemy machines and one German observation balloon ere brought down, and two other hostile machines were driven own out of control.

One of our machines is missing.

Sept. 10th, 9.17 p.m.—On the 9th inst. thick mist greatly indered aerial operations. Artillery co-operation was carried ut when possible, and a few bombs were dropped by day and ight on hostile aerodromes.

Three enemy machines were brought down and four driven own out of control.

Five of our machines are missing.

HOME COMMAND COMMUNIQUÉS.

SEPT. 5th, 12.15 a.m.—Enemy aeroplanes in considerable numbers crossed the South-East Coast shortly before 11 p.m. and dropped bombs at a number of places.

Some of the machines reached the London district, where bombs were dropped shortly before midnight.

No report of casualties or damage has been received as yet.

SEPT. 5th, 1 p.m.—Enemy aeroplanes in considerable numbers crossed the South-East Coast over a wide area between 10.31 p.m. and 2 a.m. last night.

The raiders seemed to have travelled singly or in groups of from two to three machines, for which reason it is difficult to estimate their numbers with accuracy, but it is possible that as many as 20 machines took part in the raid.

By 11.20 p.m. it became evident that enemy aeroplanes were approaching London, and at 11.45 the first bombs were dropped in the London district. From this time until about 1 a.m., 40 bombs were dropped in the district.

Bombs were also dropped at several places on the coast.

The total casualties reported so far are:—

Killed, 9; injured, 49.

The material damage is not extensive.

One enemy machine is reported to have been brought down in the sea off Sheerness.

WAR OFFICE COMMUNIQUÉ.

SEPT. 8th.—The G.O.C. the British Forces in East Africa reports:—

On Sept. 6th our aircraft co-operated successfully with the infantry, setting fire to the enemy's abattis and engaging the defenders with machine-gun fire from a height of 700 ft.

THE CASUALTY LIST.

ACCIDENTALLY KILLED.

AUGUST 27th.—A.F.C.—Larkin 970 S. B.

PERSONAL NOTICES.

DEATHS.

ASTON.—An inquest was held at Ealing on Sept 8th in the circumstances attending the death of Sec. Lt. Leonard Hug Aston, R.F.C., attd. to the School of Instruction, Acton. H was 28 years of age, and was killed while flying at Hanger H on Sept. 6th. A witness stated that Mr. Aston rose too high too short a time; he lost flying speed and had a side-slip. Th machine "banked" and finally nose-dived to earth. It cam down vertically, the engine being full on instead of being turne off. Mr. Aston must have lost his head. A similar view wa expressed by a civilian instructor. Dr. Ruck said the officer wa brought to Ealing Hospital. The upper part of the spine wa dislocated and the base of the skull fractured; there were als other injuries. Death must have been instantaneous. The jur returned a verdict of accidental death.

BURLTON.—Capt. Arthur Vivian Burlton, R.F.C. (killed Catterick in a flying accident on August 30th), aged 22, was th only son of Lt.-Col. A. H. Burlton, late R.A.M.C., and of Mr Burlton. After serving for some time in the Army Service Cor he was gazetted to the Royal Flying Corps in 1916, and wa promoted captain in June of the present year.

CLARKE.—Capt. Sydney Herbert Clarke, M.C., Wilts Regt attd. R.F.C., who died of wounds on Sept. 2nd in hospital abroa was the eldest surviving son of Mr. and Mrs. C. H. Clarke, Langsmead, Pyrford, Surrey. He was 20 years of age.

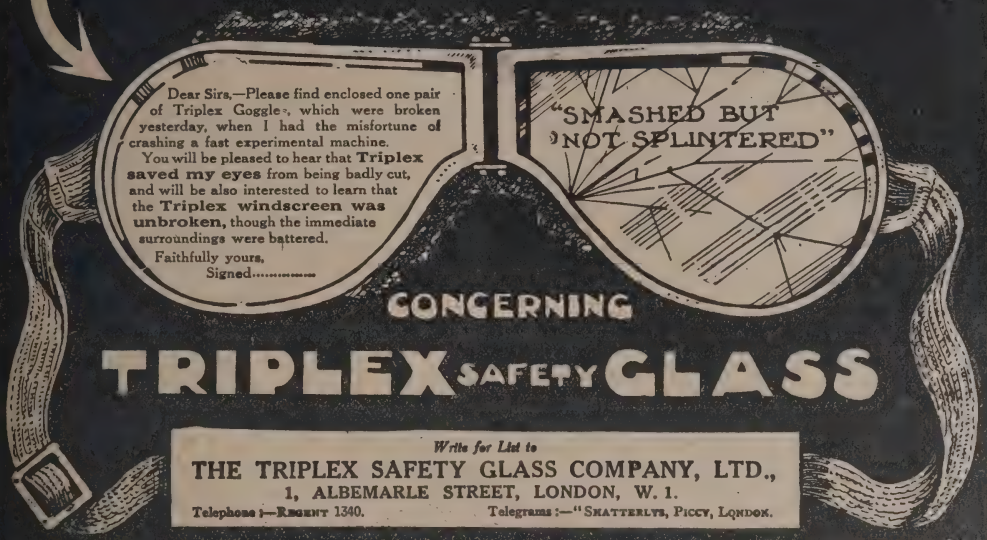
CLEGG.—Lt. Robert Leslie Clegg, Lanc. Fus. and R.F.C only son of Mr. and Mrs. Robert J. Clegg, of Holbeck, Winde mere, was killed on Sept. 3rd. Born in 1887, he was educated Mulgrave Castle by the Rev. the Marquess of Normanby, Uppingham, and later in France and Germany. At the outbrea of war he was in Ceylon, and immediately came home, enlistin in the Royal Engineers as a dispatch rider. In Oct., 1914, was gazetted to the 4th Lanc. Fus., and joined the 9th battalio in Gallipoli on Sept. 8th, 1915, where for some time he com manded a company. Soon after the evacuation he transferred the R.F.C. and served in Egypt, latterly being a flying instruct until invalided home last May. He left for the front in Augus and was killed while flying over the German lines.

CURTIS.—Sec. Lt. Henry Neville Curtis, R.F.C., who w previously reported missing, now reported killed in action whi flying over the German lines, was the only son of W. H. an Mrs. Curtis, West Street, Oundle. He was 18½ years of age.

DOWNING.—Lt. George Guy Barry Downing, R.F.C., w accidentally killed on Sept. 4th whilst flying on active servi in Scotland. He was 23 years of age, and had transferred that Corps from the Welch Regt. after service and bein wounded in France.

DUNVILLE.—A fatal aeroplane accident is reported fro Grantham on Sept. 6th, the victim being Flt. Sgt. George Du ville, R.F.C., age 24, married, whose home is in Belfast.

EDMUNDS.—A young flying officer from Johannesburg, Se Lt. V. S. Edmunds, R.F.C., aged 19, was killed while flying Shoreham (Sussex), on Sept. 6th. It is believed to have been h first "solo" trip, and he had been up but a little while when th machine crashed down, falling on the bed of the River Adur, t tide being low at the time.



An inquest was held at Shoreham on Sept. 7th on his body. witness expressed the opinion that the aviator put on the fu left rudder without a corresponding bank, with the result th the right wing dropped at the same time. He then pulled th nose up and the machine lost flying speed. It was an error judgment through lack of practical flying experience. A verdi of accidental death was returned.

GRANDIN.—Sec. Lt. Richard John Grandin, A.S.C., att R.F.C., late Capt. Royal Militia of the Island of Jersey, an Temp. Capt. A.S.C., who was reported "missing" on May 18t 1917, now officially reported killed on that date, was the husban of Marguerite Grandin (née Pitcher, 58, Anson Road, N., an only son of J. E. Grandin, Esq., St. Heliers, Jersey. He wa 24 years of age.

Mr. Grandin was educated at Victoria College, which he le at the age of 15 to join the training ship "Conway." As he faile in the last colour test, he was in the ship only six months, an then completed his education at the Lycée of St. Breux, in Franc He obtained a commission in the Jersey Militia in Decembe 1909, and commanded a company for over four years. Seein no prospect of service oversea, he applied, in November, 191 for a temporary commission as lieutenant in the A.S.C., whic he obtained, and was gazetted temporary captain in April, 191 He left for Egypt at the end of the year.

He obtained his regular commission in June, 1916 (antedate Sept. 28th, 1915), and after serving in Egypt 15 months, e changed into the R.F.C. in November, 1916. He came home complete his training, left for another front last April, and wa acting flight commander when he was reported "missing" o May 18th, being reported killed on that date on Sept 8th. H was a fine sportsman, and an experienced yachtsman.

HARGREAVES.—Sec. Lt. C. A. Hargreaves, R.F.C., whose death has occurred from wounds received in action, was the younger son of Mr. A. and Mrs. Hargreaves, of Warham Road, Harringay, N. Last month he destroyed a German aeroplane, and two days later he was severely wounded, but he brought his machine and observer back safely.

HAYES.—Lt. Reginald Hayes, R.F.C., second son of Mr. and Mrs. Thomas Hayes, of Sudbrooke Road, Wanstead Common, was killed while over the German lines, at the age of 19. He entered the Army with a commission in January, 1915, and for two years was attd. to the S. Lanc. Regt. He was wounded last November, and in January returned to the front, and three months later was transferred to the R.F.C. He was in many air fights, and his death occurred on his first flight after his return from leave.

HINCHLIFF.—Sec. Lt. Cyril Stanley Hinchliff, R.F.C., whose home is at Littlehampton, was flying over a Lincolnshire rural district on Sept. 5th when he apparently lost control over his aeroplane, which dived to earth. When assistance arrived it was found that the pilot had been so severely injured that death was probably instantaneous.

HOLMAN.—Lt. Cecil Graham Holman, King's Own Scottish Borderers, attd. R.F.C. (died of wounds received in action on Sept. 5th), was the only son of William Gilbert and Gertrude Marie Holman, of Cromwell Crescent, Earl's Court. Born in March, 1897, he was educated at the Frinton College, Philberts, Holyport, and Rossall School. He enlisted in the Public Schools Battalion in Sept., 1914, and received a temporary commission in the Yorkshire Regt. Later he was gazetted second lieutenant in the King's Own Scottish Borderers. After a year's service he joined the R.F.C., acting as observer for some months in France, and becoming a flying officer in April, 1917.

HUNT.—Sec. Lt. Geoffrey Albert Hunt, R.F.C. (died at Lincoln on Sept. 6th as the result of a flying accident two days previously), aged 18, was the only son of Mr. and Mrs. Albert Hunt, of Rothwick Road, Golder's Green, now at 107, Highbury New Park, N.5. He was gazetted in June of the present year.

KINKEAD.—A verdict of "Accidental Death" was returned at an inquest at Worthing on Sept. 4th on the body of Sec. Lt. Thompson Calder Kinkead, R.F.C., who was killed while making his second solo flight on the previous day. Mr. Kinkead, who was stated to have exhibited splendid control over the machine, came down in a spiral from a height of 2,000 ft. to 3,000 ft., next made a series of steep vertical banks for another thousand feet, and then straightened out again, apparently with the view of returning home. Unfortunately the engine failed to respond immediately, having become cold during the long descent, and at a height of 250 ft. the pilot appeared to stall the machine for the purpose of reaching a favourable landing, with the result that the machine lost its flying power and nose-dived. Mr. Kinkead was the elder son of the late Samuel Kinkead and Mrs. Kinkead, of Johannesburg. He was 24 years of age.

MATHESON.—Lt. A. P. Matheson, R.F.C. (missing, now reported killed in action on July 13th), was the only surviving son of Mrs. Alec. Matheson, of Ardarun, Littlehampton. Her other two sons have fallen in action, Capt. Ian Matheson, Seaforth Highrs., aged 22, having been killed in May last, and Lt. Roderick Kyrle Matheson, R.W. Kent Regt., wounded on Sept. 3rd, 1916, having died a prisoner of war five days later. Her son-in-law, Lt. Patrick Gould, King's Royal Rifle Corps, has also been killed in action. After serving since Dec., 1915, in the Army Service Corps, Lt. A. P. (Val) Matheson became a flying officer early in the present year.

O'BEIRNE.—Lt. Arthur James Lewis O'Beirne, Yeo., attd. R.F.C., was the only surviving son of Major O'Beirne (late R. War. Regt.), and Mrs. O'Beirne, of Astrop Grange, near Banbury, and Augherea, Co. Longford, Ireland. He was educated at Summerfields, Oxford, Radley College, where he was in the first eleven, and at Exeter College, Oxford, where he was whip to the college beagles. When war broke out he had just arrived in British East Africa, and immediately enlisted as a trooper in the East African Mounted Rifles. After nine months' fighting he was invalided home, and was then offered a commission in the Oxford Yeomanry. In December, 1916, he joined the R.F.C., and after obtaining his pilot's certificate was for some time in England. He went to the front last July, and died of wounds received in action on the 28th of that month. His only brother, Lt. John I. M. O'Beirne, R. War. Regt., attd. R.F.C., was killed at the front last April.

ROBERTS.—Lt. Arthur Doricourt Roberts, M.C., Scottish Rifles and R.F.C. (killed on August 31st when flying), aged 22, was the youngest son of the late David Thomas Roberts, C.S.I., of the Indian Civil Service, and of Mrs. Roberts, of Granville Cottage, Byfleet. Gazetted to the Scottish Rifles in November, 1914, he became lieutenant twelve months later, and was awarded the Military Cross for conspicuous gallantry in action. The official account said: "He assumed command of the assaulting forces of the battalion, reorganised and consolidated the position. He displayed great courage and initiative throughout." Mr. Roberts entered the Royal Flying Corps in September, 1916, and was a qualified observer.

SANDYS.—Lt. William Edwyn Sandys, R.F.C., only son of Mr. and Mrs. E. P. Sandys, of Calcutta, India, and Blackheath, S.E., who has been killed in action, was born in 1890. Educated first at Bath, and afterwards at St. Paul's College, where he won his colours for rowing and swimming, and from where he matriculated, he was for some years in America and Canada. He was in Lillooet, B.C., at the outbreak of war, and immediately joined up in the 1st Canadian Contingent, Lord Strathcona's Horse (R.C.). When he left Lillooet he was presented with a gold watch in recognition of his recruiting work. Coming to England, he obtained his commission in the Army Service Corps, and left for Egypt with his brother-in-law, Sec. Lt. R. J. Grandin, who has fallen in action. Transferring to the R.F.C., he acted as flight commander in Scotland and England. He left for the front in August last, and was killed in action on Sept. 5th. Lt. Sandys was a fine all-round sportsman, and had travelled extensively. He married in September, 1915, Elsie, daughter of Mrs. and the late G. A. Pitcher, of 58, Anson Road, N.7.

SAYER.—Sec. Lt. James Herbert Sayer, R.F.C., who was reported missing on April 3rd and is now officially presumed to have been killed on that date whilst engaged on a photographic reconnaissance, aged 19, was the elder son of Mr. and Mrs. C. J. Sayer, of 69, Marchmont Road, Wallington. He was educated at the Whitgift Grammar School, Croydon, where he was a sergeant in the O.T.C. He was also captain of the first fifteen and of the school shooting eight. He left the school in June, 1916, to take a commission in the R.F.C., and went to the front in the beginning of last November, having for some time previously acted as an assistant instructor. His commanding officer wrote:—"Your son was a first-class pilot and could always be depended on to carry out his job thoroughly well. He is a great loss to the squadron. . . ."

SLOANE.—Sec. Air Mech. William Douglas Sloane, A.F.C., who was accidentally killed while flying on August 21st, was the youngest son of James and Amy Sloane, Bernarra, Mulwala, N.S.W. He was 27 years of age.

VINOGRADOFF.—While flying in Wiltshire on Sept. 6th Cadet Vinogradoff, Russian Army, attd. R.F.C., was killed.

WODEHOUSE.—Sec. Lt. John Francis Ashburnham Wodehouse, Duke of Cornwall's Light Infantry, and R.F.C., killed on Aug. 26th, aged 20, was the only son of the late Francis John Wodehouse, and grandson of the late Rev. Algernon Wodehouse, M.A., rector of Easton, Hants. He was educated at Ardingly College, Hayward's Heath, and while there joined the O.T.C. He obtained his commission in the D.C.L.I. in 1915, and was wounded last year. After returning to the front he joined the R.F.C. as an artillery observation officer, and, as such, met his death. General Sir Josceline Wodehouse, G.C.B., has received a letter from the Rev. W. Kerr, saying:—". . . others will tell you of the valuable work he has done; we are mourning the loss of a brave comrade."

Engagements.

LITHGOW—BALFOUR.—The marriage arranged between Major Ernest Lithgow, R.A.M.C. and R.F.C., and Miss Dora Balfour will take place at the Parish Church, Tetbury, on Tuesday, Oct. 2nd, at 11.30. All friends will be welcome at the church.

MIDDLETON—SHORT.—The engagement is announced between Capt. John Leam Middleton, R.F.C., elder son of the late Town Clerk of Chesterfield, and Margaret, elder daughter of the late Alderman S. E. Short, J.P., and of Mrs. Short, of Brampton Manor, Chesterfield.

Marriages.

ADAMSON—THORNE.—In London, on Sept. 5th, Sec. Lt. W. Adamson, R.F.A., attd. R.F.C., was married to Emily, fourth daughter of Mr. Will Thorne, M.P.

DIXON—ANDREWS.—On Sept. 4th, at Binbrook, Lincoln, Sec. Lieut. Noël Parker Dixon, R.F.C., son of W. B. Dixon, Esq., and Mrs. Dixon, Christchurch, New Zealand, was married to Dorothy Kathleen, only daughter of the late Rev. W. and Mrs. Andrews, of Claxby Rectory, Lincoln.

LINE—DIMMOCK.—The marriage arranged between Capt. James Line, R.F.C., son of Mr. and Mrs. C. A. Line, Edgbaston, Birmingham, and Dorothy Beatrice Gertrude, second daughter of Lt.-Col. and Mrs. H. P. Dimmock, 23, Homefield Road, Wimbledon, S.W., took place on Sept. 8th at St. Mary's Church, Wimbledon.

RUSSELL—KILLICK.—On the 5th inst., at S. Paul's Withnell, Bernard Parvish Russell, R.F.C., fourth son of the late Canon Russell, Vicar of Todmorden, was married to Harriet Evelyn, third daughter of W. Henry Killick, J.P., Withnell House, Chorley, by the Rev. W. Russell, assisted by the Rev. E. J. Williams and the Rev. G. O. Redman.

TOD—CURLING BATES.—On Sept. 5th, at Christ Church, Gipsy Hill, Norwood, Sec. Lt. Malcolm Tod, Black Watch, R.F.C., was married to Margaret Evelyn May, only daughter of

BIRTHS.

CHESHIRE.—On Sept. 6th, at Chester, to Primrose, wife of Capt. G. C. Cheshire, R.F.C., B.C.L., Fellow of Exeter College, Oxford—a son.

GILBERT.—On Sept. 8th., at 23, Grange Park, Ealing, the wife (née Lepper) of Lieut. H. J. Gilbert, R.F.C., of a son.

MACAULAY.—On August 17th, at Bulkley, Alexandria, Egypt, Katharine, the wife of Captain T. C Macaulay, M.C., R.A., and R.F.C., of a daughter.

ROCKINGHAM GILL.—On Sept. 9th, 1917, to Christina, and Captain Rockingham Gill, R.G.A. and R.F.C., a daughter.

The following names appear in a list of British officers, prisoners of war, who are interned in Switzerland, and who have been passed for repatriation, which appeared in the "Morning Post," on Sept. 6th.—

Capt. Wilson, R.F.C.
Capt. Goode, R.F.C.
Sec. Lt. Grimwade, R.F.C.
Sec. Lt. Selby, R.F.C.

The above left Switzerland for England on Sept. 8th. A party which left on Sept. 11th includes:—

Capt. Darley, R.F.C.
Capt. Hill, R.F.C.
Sec. Lt. Macaskie, R.F.C.

* * *

The parents of Second Lieut. G. A .H. Parkes, R.F.C., of Upper Staplehall, Northfield, Birmingham, who was reported missing on July 15th last, have now received word from him that he is wounded and a prisoner in German hands at Johannisthal, Stettin.

RECRUITS WANTED FOR THE R.F.C.

The Secretary of the War Office makes the following announcement:—

Recent reports from the battle front illustrate the extent to which the Allies maintain superiority in the air, thanks to the bravery of our aviators and the skilled organisation of the work of construction and repair at home and in the field.

To keep this superiority further great efforts are needed, and the Royal Flying Corps is seeking men, skilled and unskilled, for its various branches. Men over age are not excluded from the corps, which offers very interesting employment at special rates of pay.

Intending applicants should communicate with the nearest recruiting officer for particulars.

[Intending applicants should note that special recruiting offices for the Royal Flying Corps exist at the Regent Street Polytechnic, London, W., and of South Farnborough, Hants, and, in the event of difficulty locally, prospective recruits will do well to apply at one of these main depôts.—Ed.]

FRANCE.

OFFICIAL COMMUNIQUÉS.

SEPT. 4th.—Last night German machines dropped bombs in the region of Dunkirk and Calais. At the latter point there were several killed and wounded.

The region north of Nancy and the neighbourhood of Lunéville were also visited by enemy aeroplanes. The material damage done was insignificant. There were no casualties.

Our bombing machines dropped numerous projectiles on different aerodromes, railway stations, and bivouacs in the enemy zone north of Soissons.

Another expedition resulted in two fires breaking out in the railway station of Fresnoy-le-Grand (south-south-east of Le Catelet).

Moreover, we bombarded the railway stations of Roulers and Lichtervelde, in Belgium, the aerodromes of Habsheim, Frescati, and Colmar, and the railway stations of Conflans, Cambrai, Thionville, Metz, Woippy, where a violent fire broke out, etc.

During these expeditions 15,590 kilogrammes (about 15 tons) of projectiles were dropped by our squadrons on the enemy objectives, which sustained important damage.

Yesterday our chaser aeroplanes brought down 13 German machines, most of which were destroyed.

ARMY OF THE ORIENT.—On the left bank of the Struma British patrols made some prisoners. British aviators bombarded the enemy camps north of Demirhissar.

SEPT. 5th.—Last night German aeroplanes again bombarded Red Cross stations in rear of the Verdun front. It is reported that some of our men were killed and wounded.

A large number of bombs were also dropped on Bar-le-Duc. There were some casualties among the civil population.

On Sept. 4th, five German aeroplanes were brought down by our pilots, and five other machines fell into their lines seriously damaged. An eleventh German aeroplane was brought down by the fire of our machine-guns.

As a reprisal for the bombardment carried out by the enemy against our Red Cross stations two of our aeroplanes dropped bombs on Trèves last night.

Our bombing aeroplanes, moreover, made a large number of raids against the railway stations of Roulers and Pithem (east-north-east of Roulers), the aerodromes of Ghistelles, the ammunition dumps of Thourout, where a violent fire broke out, the barracks of Lahr (Baden), the aerodrome of Schlettstadt (Alsace), the factories of Hagondange (north of Metz), etc.

SEPT. 6th.—Some bombs were dropped on Dunkirk, and some people among the civilian population were wounded.

Our air squadrons last night bombarded the aerodrome of Marville (south-east of Montmédy), the railway station of Challerange (south of Vouziers), and many enemy bivouacs.

SEPT. 7th.—Three German aeroplanes were brought down on Sept. 5th and 6th as the result of air fights. Twelve other machines were forced to the ground out of control.

During the night of Sept. 5th-6th our squadrons dropped 1,100 kilogrammes (over a ton) of bombs on the railway station of Thionville (north of Metz) and 1,400 kilogrammes (1 2/5 tons) on that of Woippy (near Metz).

SEPT. 10th.—On the 8th and 9th inst. five German machines were brought down in aerial fighting.

In recent weeks our pilots have continued their exploits and obtained results. Capt. Guynemer has raised to 50 the number of German machines he has destroyed. Sec. Lieut. Nungesser has gained his 30th victory, and Capt. Heurteaux his 20th, and Second Lieuts Madon, Ortoli, Lufbery, and Sergts Fonck and Jailler have accounted for their 10th adversaries.

* * *

Reuter's correspondent with the French Army reported on Sept. 6th:—

Last night the Germans made another air attack on the military hospital at Vadelaincourt (Meuse), aiming especially at a shed which was occupied by severely wounded cases from the Verdun front. The attack began at 10.30 p.m. and was kept up until 3 a.m., the aeroplanes flying over the sheds and dropping bombs every 20 or 30 minutes.

Nineteen inmates of the hospital and dependent buildings were killed, and 26 wounded. During the past month 100 persons, including several women, have been killed or wounded by the German air raiders in this hospital alone.

* * *

The special correspondent of the "Temps" (Paris, Sept. 7th) gives some details of the bombardments of Calais by enemy aviators.

On Sept. 2nd an unknown number of aeroplanes dropped some hundreds of objects resembling "Madeleines," covered with a substance resembling chocolate icing, which the chemists are analysing. On Sept. 3rd another lot of aeroplanes threw bombs of a kind hitherto unknown, which did no damage worth mentioning. In a certain inland town which the squadron bombed some hundred German prisoners were being moved, and an enemy aviator, thinking they were British troops on the march, descended to a height of 300 ft. and threw three bombs, killing 43 of the prisoners and severely wounding 47.

One enemy aeroplane was brought down at Calais and two others on Sept. 4th at Dunkirk.

GERMANY.

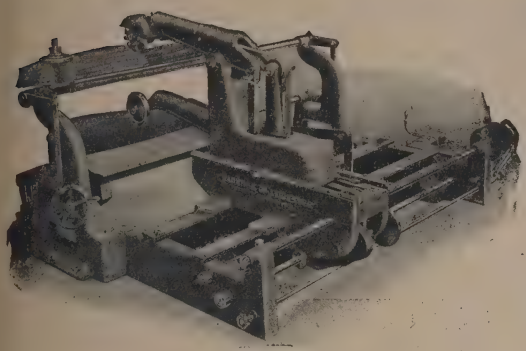
OFFICIAL COMMUNIQUÉS.

SEPT 4th.—On the night of Sept. 2nd-3rd our aviators dropped bombs on Calais and Dunkirk. The fires caused were visible throughout the whole day.

Yesterday 19 enemy aviators and two captive balloons were shot down. Baron von Richthofen achieved his 61st aerial victory, whilst Lt. Müller, who, on account of his services, was recently promoted from a vice-sergeant, brought down his 27th opponent.

Yesterday Dover and last night Chatham, Sheerness, and Ramsgate, were attacked with bombs by our aeroplanes.

SEPT. 5th.—Our aviators made a successful night attack on London.



By day and by night there has been very vigorous aerial activity and numerous bombing enterprises. Far distant objectives were successfully attacked with bombs—Dover, Boulogne, and Calais.

Twenty-two enemy aeroplanes were shot down. Lt. Voss brought down his 39th opponent.

SEPT. 6th.—Fourteen enemy aviators and one captive balloon were shot down yesterday over the Continent. Lt. Voss achieved his 40th and 41st aerial victory.

During the night of Sept. 4th-5th our aviators attacked London, Southend, and Margate. The incendiary effect of the bombs dropped was observed. One of our aeroplanes has not returned.

RICHMOND

A. RAYSON

Front of German Crown Prince.—The artillery battle before Verdun continued yesterday. Valuable services were performed by our aviators.

Sept. 7th.—Nine enemy aeroplanes were brought down in aerial engagements and five further machines by anti-aircraft guns.

Sept. 10th.—In the month of August 64 of our aeroplanes which went out against the enemy have not returned. Four of our captive balloons were shot down. In the same period the losses of our enemies amount to 37 captive balloons and at least 295 aeroplanes, of which 126 were brought down in flames behind our lines and 169 on the other side of the enemy lines.

[The 64 which "have not returned" are, obviously, those which fell in the territory held by the Allies, those which were shot down in "Hunland" certainly "returned," albeit not precisely in the manner desired.—Ed.]

RUSSIA.

Official Communiqués.

Sept. 6th.—On Sept. 1st-2nd our aviators bombarded the railway station of Goloby (20 miles S.E. of Kovel) and depots in the region of the Kizel Railway, dropping 24 poods (about 865 lbs) of bombs. On Sept. 2nd, 22 poods (about 793 lbs.) of bombs were dropped on the villages of Eleonorowka and Kluvnnyek (?Kluwince), south-west of Grzymalov (midway between Sereth and Zbrucz Rivers).

In the region of Piatna our artillery brought down an enemy aeroplane, the occupants of which were made prisoners.

Sept. 7th.—On the night of Sept. 5th-6th our aviators carried out a flight over the railway station at Baranovitchi, where eight poods (about 290 lbs.) of bombs were dropped.

In the region south-east of Lake Miadziol (65 miles south of Dvinsk) our artillery brought down an enemy aeroplane, which fell in our lines near the village of Boyary. The enemy aviators were taken prisoners.

On the evening of Sept. 5th-6th a squadron of enemy aeroplanes dropped bombs in the region of the railway station of Zamirie (on the Minsk-Baranovitchi line).

Enemy Zeppelins appeared on Sept. 5th to the south of Pernau (north-east end of the Gulf of Riga). Bombs dropped by them near Hainash (about 30 miles farther south) were without effect.

Sept. 8th.—In the Jacobstadt region (on the left bank of the Dvina, about 20 miles south-east of Kokenhusen), enemy aeroplanes have been increasingly active. Bombs were dropped on the town of Jacobstadt. The senior physician of an ambulance corps was killed, and a nurse and a student were wounded.

In the course of Sept. 7th 23 enemy aeroplanes and battleplanes carried out a series of flights and reconnaissances over Tserel (south-western point of Oesel Island, Gulf of Riga), Arensburg (chief town of Oesel), and the region of Kuivast (on Moon Island).

In the Gulf of Riga five enemy machines attacked without success our torpedo-boat patrols. In an aerial battle near Arensburg our naval aviators brought down an enemy battleplane. The machine was destroyed by fire and the aviators perished.

Our aviators dropped bombs on the small town of Telekhany (30 miles north of Pinsk, in the centre), on the Ogin Canal, where the staff of a German regiment is stationed. Successful hits were observed.

Sept. 9th.—Our aerial reconnaissances reveal considerable animation at the advanced railway stations of the enemy in the Jacobstadt and Dvinsk regions.

Our aeroplanes dropped bombs on the enemy depôts in the village of Rodze (north-west of Postavy), south of Dvinsk, and also attacked the village of Ozaritchi (20 miles north-west of Pinsk) on the Ogin Canal, where the quarters of a German regiment were established.

Roumanian Front.—On Sept. 7th a squadron of enemy aeroplanes made a raid on the station of Ajud and dropped a number of bombs.

Sept. 10th.—On Sept. 8th, after midnight, enemy hydro-aeroplanes dropped 40 bombs on the batteries at Tserel (southern extremity of Oesel Island, Gulf of Riga), without effect.

In the Gulf of Riga a group of our torpedo-boats was twice attacked by 16 enemy machines, which were met by the concentrated fire of our torpedo-boats. Forty bombs were dropped without result.

An enemy Zeppelin was observed making a reconnaissance to the west of the Island of Oesel, direction of Segevold.

In the region to the south-east of the small town of Krevo our artillery brought down an enemy aeroplane, which fell near the village of Mekulevstchi The German aviators were killed.

Yesterday, in the region of Luninetz railway station, an enemy aeroplane dropped several bombs in the neighbourhood of the hospital. One of the military patients was killed, and ten patients, three assistants, and one small boy were wounded.

AUSTRIA.

Official Communiqués.

Sept. 7th.—Enemy aviators are now making attacks on the open town of Trieste daily.

Sept. 8th.—Trieste has again been bombed by aviators.

Sept. 9th.—On Sept. 7th, as a reprisal for the repeated attacks of enemy aviators on the open town of Trieste, our seaplanes, on the night of the 7th, copiously and most successfully dropped bombs on the naval arsenal and military establishments of Venice. Numerous hits were reliably observed. All our aeroplanes returned.

ITALY.

Official Communiqués.

Sept. 4th.—On the Julian front there has been considerable activity on the part of our aeroplanes.

Last night in favourable atmospheric conditions 30 of our aeroplanes flew over Pola and bombarded the military works of this naval port and the enemy fleet at anchor in the harbour and in the Fasana Canal (between the mainland and the islands of San Nicolo and Brioni, north of Pola). Nine tons of bombs were dropped on the targets, causing destruction and big conflagrations. Our machines, though attacked by seaplanes and shelled by anti-aircraft batteries, returned safely to their bases.

On the night of the 1st-2nd instant enemy aircraft carried out a bombing raid on some locality in the plain between the Lower Isonzo and the Tagliamento, causing casualties among the civil population and soldiers in hospitals.

Sept. 5th.—Yesterday the battle on the Julian front was renewed violently.

Two hundred and sixty-one of our aeroplanes participated in the battle, bombarding the enemy's troops and communication lines.

On the night of the 4th-5th inst. our air fleet renewed the bombardment of Pola with effective results and returned safely to its base.

Sept. 6th.—In the Bazza Valley (Tolmino) (Upper Isonzo), east of Chiapovano Valley, in the Voiscizza region (1¾ miles south-east of Kostanjevica), and on the reverse of Hermada enemy batteries and troops were very effectively bombarded by our aviators.

Sept. 7th.—Our aeroplanes repeatedly destroyed or threw into confusion enemy batteries of the Panovizza Wood and Ternova Forest (respectively east and north-east of Gorizia), and in the communication lines on the Carso.

Sept. 10th.—Our aeroplanes bombarded enemy batteries in the Ternova Forest (north-east of Gorizia). The enemy attacked them with intense anti-aircraft fire.

* * *

The "Agenzia Stephano" (Rome, Sept. 10th.) reports a dramatic duel over Bellona, between an Austrian Albatros and an Italian Nieuport, piloted by Sergt.-Aviator Dellaro

The latter's machine-gun became jammed, but Dellaro, instead of taking advantage of the superior speed of his machine to withdraw from the fight, deliberately charged the Austrian machine, both coming down from a height of 9,000 feet. The Italian and Austrian aviators were buried together with military honours.

[It seems more probable that the collision was purely accidental.—Ed.]

* * *

The "Corriere della Sera" published on 30th ult. a long account of the great part taken in the recent offensive by the Aero Corps. Some extracts from this article are of distinct interest, as is the fact that no mention occurs in it of any hurt Caproni machines. I therefore give the following :—

Yesterday, too, the violent attacks of our infantry were greatly helped by our aerial forces, which have become stronger than those of the enemy. . . .

On the 19th inst. 85 Capronis went off with a load of explosives to chastise the lines behind the enemy front from Tolmino to the sea. On the 20th, during our infantry attacks, another 85 Capronis deposed tons of explosives along the Chiapovano Valley. . . . On the 21st, 78 machines carried on the bombing with evident destruction of waggons and columns of the enemy in flight. On the 22nd another 45 Capronis were out planting bombs on the enemy, who hastily removed his second line, etc. to . . . and his first to . . .

Forty-four machines kept up the bombing on 23rd inst.; 48 on 24th, and the same number on 25th.

On the succeeding days the aerial action never stopped, and the enemy's retreating movements, as well as his efforts to change or strengthen his position, were harassed by the constant brave and untiring work of our Capronis. . . .

As well as destroying, the aerial activity set out to nip in the bud any attempts at counter-offensive tactics.

On the 9th the Caproni squadrons, it must be remembered, had braved the fire of the 300 A.A. cannons defending Pola. . . . Also, that in certain actions in the dark over the Adriatic, no less than 240 men were up at the same time. Some of the pilots were on service for as much as seven hours at a stretch. Over the land actions, having destroyed the wire entanglements, the

KINDLY MENTION "THE AEROPLANE" WHEN CORRESPONDING WITH ADVERTISERS.

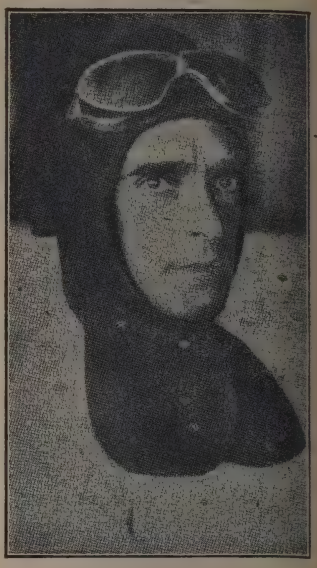
FLYING IN BRAZIL.

(Translated from the "Auto Propulsão" of Rio de Janeiro.)

In a recent issue of "Auto Propulsão," of Rio de Janeiro, is an account of the presentation of certificates to the officers completing their course of training for the Naval Aviation Service. The description reads thus :—

The Marine Aviation School had a magnificent ceremony to mark the presentation of pilots' certificates to five of its students, Army officers, and military aerial observers' certificates to seven Naval officers, the last having already gained pilots' tickets.

The President of the Republic and the Minister of Marine made a surprise visit by seaplane from Mauá to the School on Enxadas Island, and in a pretty flight passed over the Monroe Palace, from which they returned to the Island, where they landed at 12.45 to the strains of the National Hymn, played by the band of the Dreadnought "Minas Gorves." The President was photographed standing in the machine, wearing an aviator's helmet; after which, he received the salute of the authorities present, and gave an enthusiastic account of his impressions of the flight and the beauties of the panorama of the city as seen from the air.



The presentation of the certificates was preceded by the final tests of the pilots, who were :—First Lieut. Raul Vieira de Mello; Sec. Lieuts. Mario Barbedo, Haroldo Borges Leitão, and Anor Teixeira dos Santos Barbedo, Haroldo Borges Leitão, and junior. The examining board was composed of Corvette Captain Protogenes Guimaraes, the School Director, President; Lieuts. Belisario da Moura, Sá Earp and Schrots, Aviator Examiners, the lists consisting of flights, tracing "8s," and spirals.

After the board had compared notes, and passed the candidates, the planes flew off to bring the President and the Minister of Marine from the Mauá station.

At the ceremony were present Admiral Gustavo Garnier, Chief of the General Staff of the Navy; the Minister of War, Commendator Gregorio Seabra, President of the Aero Club of Brazil; Generals Silva Faro and Felippi Aché; Frigate Captain Vieira Mascarenhas, Director of the Naval School; Corvette Captains Prologenes Guimaraes and Antonio Cardoso, Director and Vice-Director of the Aviation School; Colonels Leite de Castro, Vieira Leal and Sisson, Directors of the Military School; Colonel Tasso Fragoso, of the President's Military Staff, a large number of Naval and Military officers, many families and persons of high society.

The military honours to the President were paid by the Naval School, which had remained in the hall during an examination. On the arrival of the president in the hall, all the candidates rose, and Admiral Mourão dos Santos, President of the Examining Board, advanced to receive His Excellency. After the usual courtesies, the company proceeded to the hangar, where the certificates were distributed, after being signed by the Minister of Marine and by the President of the Republic.

The Military Lieutenant-Aviators, Raul Vieira de Mello, Mario Barbedo, Haroldo Borges Leitão and Anor Teixeiro dos Santos received pilots' certificates; following which certificates of aviators; military observers, were presented to Naval Lieutenants Belisario da Moura, Heitor Várady, Sá Earp, Schorts, Silva Santos, and Mario Godinho. The President shook hands with each, and at the presentation of the last certificate there was prolonged applause. The Director of the School was warmly complimented by the President.

Corv-Captain Protogenes Guimeraes, Director of the Brazilian Naval School at the Island of Enxadas.

Telegrams: "Aercracons," Canning, London. 'Phone: East 1300.

The Minister of Marine then made a stirring speech, calling upon the young men present to work earnestly for the country, declaring in the name of the President, and as a soldier and Brazilian, his great satisfaction with all that he had seen. The Minister of War also spoke, thanking the Navy for the courtesy accorded to the Army which he represented, and emphasising the ties of friendship, ever more intimate, which unite the two forces of the Union.

Dr. Romulo Avellar wound up, in the name of the Brazilian people, welcoming the President of the Republic. An excellent lunch followed.

Army Lieutenant Raul Vieira de Mello, as soon as he received his certificate, mounted the nacelle of seaplane "C1," and made a fine flight over the city, including a difficult spiral over the Monroe Palace.

During the lunch, the President's sons, José and Francisco Braz, and Dr Raul de Sá, the President's secretary, had several flights in machines piloted by Lieuts. Delamare and Schorts. At a given signal the three School seaplanes rose, piloted by Lieuts. Delamare, Sá Earp, and Raul Vieira de Mello, making an interesting spectacle of the three machines, cutting the air in elegant and daring curves, now high, now in mid-air, and then nearly touching the water. It was 3 p.m. when the President left in the yacht, "Tenente Rosa" for Mauá, whence he returned to Petropolis. The Minister of Marine and other officials returned in the launch "Olga."

On April 22nd Flt. Lieut. Sá Earp made a long flight over the city in seaplane "C3" of the Naval Aviation School. His object was to achieve a height test, making a diagonal over a great part of the city. The machine rose continually for nearly an hour after the start, when the height gauge marked 1,325 metres, a height very difficult to reach with a machine of this type. This brilliant flight gave Lieut. Sá Earp the "record" for the School. In the United States the greatest height reached by flying boats had been 1,680 metres. The pilot carried as passenger Lieut. Epaminondas.

The Minister of War, encouraged by the success of the Naval Aviation School, has decided to establish an aviation school for the Brazilian Army, and has already ordered several machines from the United States, which were due in April to arrive shortly.

The officers charged to choose the most suitable type of machine for the Brazilian Navy in the United States, have reported in favour of the "Standard" type, and are completing their negotiations. The machines chosen will have two 100-h.p. engines each, giving them a speed of 100 miles per hour. They carry wireless, machine-guns, bomb-droppers, and cameras. It is expected that they will be delivered in six months.

About 9 p.m. on April 2nd, whilst flying over Rio Harbour, the hydro-aeroplane "C2," piloted by First Lieut. Belisario de Moura and Sec. Lieut. Fabio Sá Earp, side-slipped. The machine was flying round the Enxadas Island, when something failed, and the machine and its occupants fell into the sea. The great noise of the fall attracted the attention of Customs Officer Alberto Periera, on patrol duty in the guard launch round the German vessels. Making for the place, he found the damaged machine and the two officers wounded and drenched. He rescued them and took them promptly to the Island, and then towed the seaplane to its base. The machine and the pilots were not seriously damaged.

At a meeting of the Brazilian Aero Club a letter was read from General Agobar thanking the Club for its offer of a free entry to the course of the Aviation School for an officer of the Police Brigade, and nominating Sub-Lieut. Travassas for the studentship.

A letter was also read from the Director of the Naval Aviation School thanking the Club for appointing Naval Lieut. Virginius Delamare on its Technical Committee, and expressing his sense of the great services rendered to the cause of aviation in Brazil by the Club.

Senhor Estanislao Woickeckowsky exhibited the drawings of a new machine of his invention, which it was resolved to submit to the Technical Committee.

The President, Commendador Seabra, spoke about the recent occurrences at the Naval Aviation School, praising the work of the Director and his assistants, which enabled the country to count on yet another group of skilful pilots, who will certainly be new pioneers in Brazilian aeronautical progress.

The Aero Club of America, which Santos Dumont represented in the Conference, during the Pan-American Exposition, is exerting itself to make the second Conference, to be held shortly in Rio, a great success, and the Exhibition held in New York made a good preparation for the second Conference. The Aero Club of Brazil, which has the organisation of the Conference in its charge, has carried on an extensive correspondence with similar organisations, and there is good reason to believe that this continual exchange of ideas will prove highly profitable.

The Naval Aviation School has already produced 19 certified pilots, and as the teaching staff is being augmented, it appears that the Brazilian Government intends to increase the number rapidly. Both Army and Navy send candidates to this school.

The Brazilian Navy already possesses several seaplanes. One of these took part in the military parade at Rio on June 11th, making prolonged flights along the route of march with many manœuvres, exciting the awed admiration of the spectators. The journal remarks that this exhibition demonstrated the complete ability of the home-trained pilots, and the necessity of Parliament voting the means to obtain a large aerial fleet, and to form a flying corps.

Towards this, ten American "Standard" seaplanes were due to arrive in July last. These are double-engined machines, with Hall-Scott 100-h.p. engines, bomb-droppers, with Sperry sights, wireless and photographic apparatus.

At least one person, Lieut. Villela, is building aeroplanes to his own designs in Rio. All the wood employed is of native growth. Brazil is well known to be rich in forest products, many of the timbers are not known in Europe. They are in great variety, and it seems possible that an investigation with a view to the opening up of new sources of aeroplane timber would have good results.

[It may be mentioned that the Government of the State of San Paulo, published some years since the results of a pretty complete series of mechanical tests on a large number of timbers from the forests of that State, most of them properly identified by botanical as well as popular names, so that there is some preliminary information to go on. Plenty of wood grows on the coast ranges, but it yields poor timber, being of quick growth. All the good stuff for structural use comes from pretty far inland, and transport is a difficulty.—TRANSLATOR.]

AIR CURRENTS.

A SECRET OF THE RAID—A TRUE STORY.

Overheard in a 'bus "somewhere in London":—

First Lady: "But I am sure they were not aeroplanes."

Second Lady: "What were they then? They say they were not Zepps."

First Lady: "No they were much worse than Zeppelins. I remember the Zeppelin raids. But last night—if you had heard the machinery!—It was dreadful!"

Second Lady: "Well, if they were not aeroplanes, and not Zeppelins, what were they?"

First Lady (with an air of great intelligence and firm conviction): "They were Tawbs of course!"

* * *

A raid story: An old gentleman from the country, tremulous with fear after hearing bombs and gunfire, emerged from his hotel with his wife. In the street they inquired of an imperturbable police-constable if it was "all over." The policeman, imagining they were eager sightseers, said, "Well, I'm afraid, sir, it is all over; but they may return in 'alf an 'our." Rapid departure of old lady and gentleman.

* * *

The pessimists who go about bewailing that woman, because she has embarked on a sea of work, is losing all her femininity in dress and other matters, need not be too downcast. A delightful portrait has just reached England of a young French mechanic stopping her operations on an aeroplane in order to powder her nose and colour her lips.

* * *

The following scrap of dialogue was overheard in a railway train the other evening:—

Lady: "These air raids ought to be stopped."

Soldier: "Well, I don't see how you can stop 'em. Our machines can't be everywhere at the same time. And look at all the air there is in the world. . . . Miles of it, if you come to reckon up!"

RECONSTRUCTION.

*WHITEHEAD AIRCRAFT, LIMITED.

Notice is hereby given pursuant to Section 188 of the Companies (Consolidation) Act, 1908, that a Meeting of Creditors of Whitehead Aircraft Limited will be held at the offices of the said Company's Works, Grena Lodge, Grena Road, Richmond, Surrey, on Thursday, the 20th day of September, 1917, at 11.30 o'clock in the forenoon, for the purposes provided for in the said Section.

Dated the 11th day of September, 1917.

J. A. WHITEHEAD, Liquidator, 31, Townshend Terrace, Richmond, Surrey.

*In order to meet the great expansion of its business, this Company is (in accordance with Resolutions of its shareholders) transferring its undertaking to Whitehead Aircraft (1917) Limited, which Company is being formed for the purpose, with a Share and Debenture Capital of £1,250,000. Whitehead Aircraft, Ltd., has, therefore, necessarily to be liquidated, but pending completion of the above arrangements the business will be carried on as usual by Whitehead Aircraft, Limited. The old Company's Creditors will be taken over by the new Company and their accounts discharged in due course of business.

THE CURTISS CORRUPTION CHARGES.

At the Central Criminal Court on Sept. 4th, before the Recorder, Mr. H. D. Roome, who, with the Attorney-General and Sir Archibald Bodkin, appeared for the prosecution, said he was instructed to apply that the hearing of the case of Mr. William Augustus Casson, on bail, should be postponed until the next Sessions. It was, counsel said, a charge under the Prevention of Corruption Act in respect of commissions alleged to have been received on orders from the Admiralty in respect of aeroplanes.

Mr. Patrick Hastings, counsel for the defence, assented to the application, and the Recorder granted it. The hearing of the case was accordingly postponed until the next Sessions, Mr. Casson being admitted to bail.

JAPANESE AVIATION.

The "Japan Times" states that at present altogether eight Japanese aviators are with the French military flying corps, according to a recent letter from Baron Shigeno, who is taking an active part in the aerial warfare against the Huns somewhere in France. They are Major Isobe, Baron Shigeno, Mr. Ishibashi, Mr. Kobayashi, Mr. Madzume, and three others. Baron Shigeno reports that Mr. Ishibashi and Mr. Madzume have obtained French military aviators' certificates, and the former has been appointed aviation sergeant by the French Government.

Baron Shigeno writes that he has recently been provided with a Spad aeroplane. He says that when he got the machine he was more delighted than if he had been decorated with the Legion of Honour.

While aviation among civilian pilots is generally considered as a thing of the future in Japan, and there is only a handful of local aviators nowadays, it is of interest to learn that a popular aviation school has been recently established at Haneda, near Tokyo, by Mr. Tamai, a civilian aviator, and Mr. Aiba, former editor of the "Aviation World," a popular Tokyo monthly devoted to aerial navigation.

A RECOGNITION OF BRAVERY.

In the official orders of the London Fire Brigade of Sept. 10th, signed by the chief officer, the following were commended "for assisting to save life at the scene of an explosion caused by bombs dropped from enemy aircraft on July 7th., 1917": James Benedictus (London Volunteer Rifles), Firemen, A. P. Livitt, J. W. Patterson, T. J. Lloyd, H. E. Brewer, and T. Ferrow.

A PHILOSOPHIC VIEW.

TO THE EDITOR OF THE "TIMES."

Sir,—I venture to deprecate the tendency to attribute the success of enemy air raids to the supposed supineness of the War Cabinet in the matter of the Army and Navy Air Services. The best defence is attack at the front, and a thousand defensive planes would not have prevented the raids of the 3rd and 4th Sept. It would be absurd to suppose that bombed French towns insist on the Government giving them local protection, or that bombed military hospitals complain against the military authorities. It should by now be recognised that the bombing of places behind the front line is always possible, and it will be wise for us to realise that aircraft have brought us nearer the front line than we ever were before, and that therefore we must now take our chances with the fighting men.

I am, Sir, your obedient servant,
H. D'ARCH BRETON, Col. R.E. (ret.),
Mayor of Rochester.

Guildhall, Rochester, Kent, Sept. 7th.

[Which is in agreement with General Brancker's dictum that, though it may be impossible to prevent aeroplanes from arriving, it may be possible to make them afraid to start.—Ed.]

MATRIMONIAL TROUBLES.

The Recorder at the Old Bailey on Sept. 4th postponed sentence on Christopher Roberts, 44, a captain in the R.F.C., who pleaded guilty to bigamy. An inquiry is to be made whether the Army will re-accept him.

It was stated that he joined seven years ago, and rose from the ranks because of his brave conduct in the face of the enemy. Invalided home with shell shock, he had walked about the Embankment at night contemplating suicide on account of the bad state of his nerves. It was then that he met his second "wife," a girl of 20.

* * *

Sentence of one day's imprisonment (he having been in custody since June 21st) was passed by the Recorder at the Old Bailey on Sept. 4th on Samuel Driggett, 27, who pleaded guilty to bigamy. It was stated that he went from America to Australia, where he married. He served in the Australian Army a short time, and deserted. Soon after arriving in England he married two girls, joined the R.F.C., and deserted. His Australian marriage came to light during the hearing of a case at the last Sessions. An officer told the Court that a woman in Quebec was also receiving a separation allowance.

ON THE COMFORT AND SAFETY OF PILOTS.

At one time or another criticisms of officially designed eroplanes have appeared in this paper, and in consequence the ignorant, both the wilful and the merely orn so, have represented that it has been my bject to give the impression that officially designed achines ought not to exist at all and that all trade-esigned are perfect. That is very far from the truth, r when occasion has so demanded many suggestions ave been made for the improvement of aeroplanes in eneral, irrespective of their origin. Such occasion ccurred recently when I ventured to indicate certain oints on which the enemy's machines seemed worthy f study. Another point, not particularly concerning nemy aeroplanes, seems worth raising to-day.

Some time ago a friend of mine, a very clever de-igner, spent a considerable time and much trouble in oing from place to place consulting with pilots on natters of design, with the particular object of finding ut why certain machines were popular and why others ere not. Being a horribly methodical person, he made sort of table of the answers to his various questions. When he had finished, he dissected the lot carefully, nd found to his surprise that the quality which seemed o weigh most with the pilots themselves was whether hey were comfortable in the machines or not.

A machine might have wonderful speed, excellent limb, good controllability, and all the rest of the things hich the active-service pilot demands; but if the cockpit as uncomfortable, the majority of pilots condemned he machine. On the other hand, a machine might be trifle slow, might be only a moderate climber, might ave a trick of spinning if the pilot was not careful, nd might have other bad qualities; but so long as the ilot was comfortable in his seat the machine was opular.

The Pilot's Boudoir.

So pronounced was this feeling that my friend re-narked, only half jokingly, "The next time I design n aeroplane, I'm going to design a b—— boudoir for he pilot, and then build the rest of the machine round t."

As Happy Fanny Fields used to say, "Dere vos many true vord shpoken from der chest," and I strongly ecommend aeroplane designers, young and old, trade nd official, to keep this in view when next designing new machine. I am not giving any hint to the enemy y raising the point, because one of the criticisms of British machines which appeared in the reports of the Berlin Aeronautical War Trophy Exhibition was the wkward arrangement of the pilot's "boudoir," which ve usually call the "cockpit," and for which that harming writer, M. Lagorgette, of *L'Aérophile*, has oined the elegant word "habitacle"—at least, I imagine e has coined it, for I have never come across it in any ther writer.

When one comes to think of it, there is nothing surprising in the pilot's desire for comfort. If one has a long patrol to do, with every nerve alert on the look-out for enemy machines, or enemy troop movements, or enemy submarines, one does not want to have one's attention diverted by a crick in the neck, caused by straining to see over a fuselage which is too high or too wide. Nor, if one is fighting half a dozen Huns at once, does one want to have to keep bobbing up and down and from side to side to see them, at the imminent risk of banging one's anatomy against bits of the machine in doing so. I have never tried the latter alternative, but I should imagine that a project

The late Lieut. Schäfer (on ladder) and Lieut. Baron von Richthofen (in the machine) inspecting the "boudoir" of a new 'chaser, with slab-sided ply-wood fuselage.

ing angle-piece in the funny-bone hurts far more than a bullet in the brain. And, if one has got to die in an aeroplane, one might at least be permitted to die comfortably.

A Case in Point.

One pilot of my acquaintance, who has had considerable experience of active service, tells me that in one fighting machine on which he has flown a good deal—a machine which is admirable in many respects—a strengthening stay cuts into the pilot's back, and another, on which the gun is mounted, crosses between his eyes and the instrument board. Now there you have an excellent example of the minor worries of life which may make all the difference between winning and losing an air fight.

The pilot starts by developing corns in the small of the back—always an uncomfortable part of one's anatomy—and that discomfort may just monopolise his attention at a critical moment, so that he may not see an enemy machine coming for him, and he may be shot down before he knows he is being attacked. And apart from that, continual dodging of the cross-bar in reading his instruments is quite likely to cause eye-strain and to spoil his shooting when he glues his eyes to his gun-sights.

Quite possibly a pilot of a different size might no'

GERMAN AEROPLANES IN THE MAKING.—An interesting attempt to gear down an 8-cylinder Mercédès engine in ar Albatros. The neat arrangement for the junction of the taper ing wood fuselage, the cowl, the propeller, and the propelle pot should be noted, also that the centre of the propeller is cut away inside the cowling.

be thus discommoded in the same machine. The cross-strut might just catch his back in a comfortable place, and his line of sight might be permanently above or below the gun-rail. And thus one might find a dozen pilots who would curse the machine as the most uncomfortable they had ever flown, and another dozen who would swear that they would just as soon be in it as in an armchair in the mess.

A Question of Dimensions.

Unfortunately, one cannot afford to make seats and things adjustable in an aeroplane, owing to the increase in weight which the adjusting gadgets would demand, so the position is rather like that presented to buyers of cars in the early days of motoring before one thought of buying a chassis and having the body built to fit oneself. In those days, and, for the matter of that, in these days, if one bought a standardised cheap car, one did not buy the most pleasing car; one bought the car which was built or designed by the man who was nearest to one's own size. Every works manager built his cars to fit himself, and, if he had short legs, he did not sell cars to long-legged customers: that was all there was to it.

In much the same way, aeroplanes have been designed until recently to fit either the works manager, or the firm's pet test pilot, or the designer himself if he happens also to be a pilot. And then when the machines are delivered, pilots are told off to them, and have to squeeze in anywhere they can induce themselves to fit, if they happen to be what haberdashers call an "out size," in which case they suffer from cramp sooner or later, or else they have to fly with arms and legs at full stretch, which is nearly as bad.

Perhaps there may be by now a sort of "stock-size" in dimensions for cockpits, but, even so, these dimensions only fit stock-size pilots. There does not seem any very obvious remedy, owing to the impossibility of adjusting seating arrangements, as before mentioned, but the matter is one to which designers might well give their attention. The other way out, of course, is to select pilots for certain machines according to the dimensions of those particular machines, but that would involve endless trouble in allotting personnel, and could scarcely be considered.

Naturally, if a lanky pilot has a consuming desire to fly a tiny scout, and finds when he climbs into it that he has to fold up like a three-foot rule to get his feet on the rudder-bar, and to keep his head from sticking holes in the upper plane, he is told to go and fly something where there is more room for him to unroll himself; but that is not quite the same thing as allotting pilots or observers with a tape measure instead of on account of their military capacity.

However, there is the problem. Think it over.

Matters of Detail.

There are many little matters of detail which also seem to deserve more attention than they receive from designers. One pilot, for example, complains that in one very good machine the throttle control is on the side of the fuselage on the right, so that when one wants to control the engine in "split-air spirals" one has to manœuvre the machine with the left hand only. Not being a pilot myself, I cannot judge the precise degree of difficulty involved in doing so, but I should imagine that it varies according to whether the machine is light or heavy on her controls.

Most car drivers are accustomed to swing cars about with the left hand on the wheel while they play with the gear lever with the right, so left-hand manœuvring would probably be easier than right-hand, but I take it that my young friend would prefer to sit dead central in the machine with both hands on the control stick, not because of the extra strength required and thus acquired, but because of the nicer feeling of balance. There seems no particular reason, if that be so, why the throttle control should not be fixed on the stick itself instead of on the side of the fuselage, seeing that Bowden wires are generally used in either case.

It is true that he probably has his gun-control on the stick already, and possibly the engine ignition switch as well; but if the engine will stand throttling the switch may as well be fixed to the fuselage instead for it will only be wanted when landing, or at some other time when it is desired to stop the engine altogether.

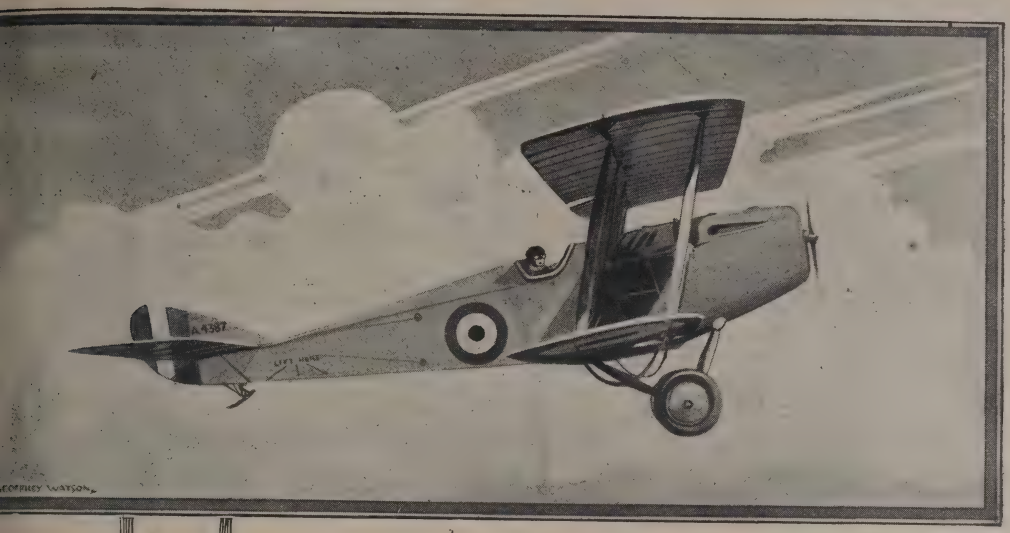
Inaccessibility.

In yet another machine, now apparently obsolescent, it was the custom to fit the petrol-pressure valve away under a shelf in an almost inaccessible position, and the petrol cock was equally awkwardly placed. So far as that particular machine is concerned, the matter is now of much importance, but it is of considerable importance that the error should not be perpetuated in later machines.

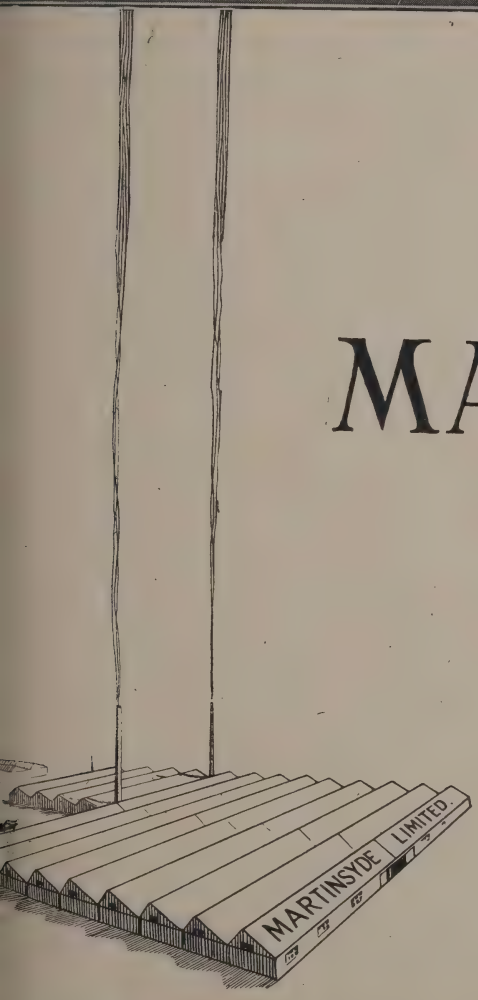
In view of the ever-present danger of fire on aeroplanes, both the pressure valve and the petrol cock should be immediately within the reach of the pilot, and, if possible, there should be supplementary controls for them to the passenger's seat, so that, if the pilot is knocked out, the passenger can regulate the pressure and cut off the petrol supply.

Screw-down valves or turn-off taps ought not to be used, as they are small, and one's hand may easily miss them in that instant which makes all the difference between a momentary burst of flame and the setting on fire of the whole machine. It seems probable that a lever of considerable length, with a long travel which can be slammed open or shut at one blow, would be more advisable.

A Safety Device.



Apropos the fire danger, so far I have heard nothing further of quick-release devices for petrol tanks, a subject which was discussed at some length many months if not years, ago. Many a machine which lands out of control, even from ordinary engine failure, and only damages the crew, catches fire and burns them to death through the bursting of the petrol tank; whereas if the petrol could all be shot out of the tank in an instant before the machine hits the ground, there would be no fire.



Even when a machine has caught fire in the air, as has happened only too frequently, the amount of fire could be reduced very considerably if the bulk of the petrol could be released into the air below the machine. If it caught fire from the existing fire as it fell, it would only blaze like the tail of a comet for an instant, and though it might scorch the fuselage and tail, it would certainly do less harm than if it remained in the tank and burnt inside the machine.

Some Examples.

I have not heard full details of the death of that gallant young officer, Major Bannatyne, D.S.O., but from the published reports it seems that the petrol in his machine must have kept on burning for some minutes. There is also the case of the late Sergeant Mottershead, V.C., who brought his machine down in flames and landed safely, thus preserving his passenger's life and dying from burns himself. And a couple of years ago there was the case of Lieut. (now Major) Dyke-Acland, who saved both his passenger's and his own life under similar circumstances (and did not even get an Albert Medal for it).

In all those cases it seems highly probable that, if all

MARTINSYDE

Aerodrome and Auxiliary Works:
BROOKLANDS.

Head Office & Works:
WOKING, Surrey.

SBAC
THE SOCIETY OF BRITISH AIRCRAFT CONSTRUCTORS

the petrol in the tanks could have been jettisoned at once by throwing open a big valve, or by ripping open a panel in the tank, communicating with a big metal shoot under the machine to prevent the wind from blowing the blazing petrol onto the fabric, the fuel which kept the fire alight would have been consumed in a few seconds, and the smouldering wood and fabric could have been put out with an ordinary squirt fire-extinguisher. The weight of such a release device would be a mere nothing to a modern machine, if the gadgets were properly designed. And if it were decided that the weight was too great to permit of its use on the small fighting machines, where every ounce counts against speed and climb, it could at any rate be used on big bombing machines and on home training machines.

Wood Fuselages Again.

Incidentally, there seems to be hereabouts a further argument in favour of using three-ply wood for fuselage covering. If petrol thus suddenly released did catch fire and spread itself over the fuselage owing to the course of the airstreams round the body of the machine, it seems much less likely that it would burn through ply-wood than through loose fabric.

The best of non-inflammable dopes will fry up an frizzle in a direct flame, and if the fabric under the do is set on fire it will blaze if subjected to a draugh whereas it is possible to make wood practically fir proof by impregnating it with certain chemicals. Als the flat, hard, polished surface of wood, treated wi non-inflammable varnish, would shed most of the petr as soon as it touched it, and, anyhow, would be ve hard to burn through.

I wonder whether the Germans' almost universal u of wood-covered fuselages has anything to do with th being less liable to fire than fabric covering, in additi to their many other advantages, as discussed a cou of weeks ago.

Anyhow, there is the suggestion for what it is wort Our designers, official and unofficial, will do well study the question, for undoubtedly some sort of assu ance that the danger of fire is being materially reduc will contribute quite considerably to the comfort mind of pilots, both at home and abroad. The remov of the ever-present idea of fire from the back of a pilo mind will probably conduce to his comfort as much the removal of the ever-present cross-strut from t small of his back.

THE DURATION OF THE WAR—(*Continued*).

BY ROGER BAYONS.

One of the minor newsprints has during the past week published an article containing figures purporting to give the numbers of personnel available to the Central Empires immediately before the war and at the present time. It is stated therein that Germany began the war with a mobilisable strength of 14,000,000 men if all classes up to that of 1920 were included. Of these casualties and unfitness are said to account for seven and a half millions, leaving in the field a force of 6,500,000. If these calculations are to be relied upon, there is little solace for those who say that our enemies are at the present time short of men.

No note is made of the men under arms belonging to the allied States of Austria-Hungary, Turkey, and Bulgaria. If their resources be added, the supply of trained men would appear to be huge.

But, as was pointed out a fortnight ago, the Germanic allies do not lack men under arms and engaged in one or other of the occupations forming an integral part of the operations of war. They have sufficient for their present needs in the field. Their difficulty is in the necessary reserves.

As week succeeds week in the progress of the war, and Great Britain and its supporting nations bring more and more men into the field, it will be possible for us to expend, if necessary, two lives of our men to every German life extinguished in battle without feeling seriously the loss involved. But the enemy, on the other hand, cannot replace such losses. And it may be that on conditions such as these we must base our hopes of victory.

It is not necessary to lose two men that one enemy soldier may die, but it is of vital importance to be able to do so without effort. In the absence of other and quicker means, the destruction of enemy personnel will serve to bring victory to the Allies.

Matériel.

The supply of matériel is the next matter of great importance in the decision of the war. As days pass by, warlike effort intensifies, and the amount of matériel used in each operation increases rapidly. A preliminary bombardment of to-day uses as many shells as a year of war in a period not yet very remote. The combin casualties of a modern battle, extending over wee instead of hours, and hundreds instead of tens of mil often more than double the entire losses of the Sou African War.

Quantities equalling the whole reserve of shells of categories in the British Army of pre-war days are i expended in a single week. And such expenditure become a deciding factor. Success by skilful manœu is less common, and has almost entirely been repla for the present by the crushing effect of bombardme Our advances in France are largely the result of super volume of fire, and are not always in any great deg to be attributed to a higher quality in the troops gaged on our side, nor to greater skill in the high command.

Under the prevailing conditions of trench warfa under which neither army cares to put their fortu to the test of open warfare, troops can be driven fr their positions by sheer weight of metal, provided t the counter-bombardment does not equal the atta When conditions are equal, success lies with him w has made the better dispositions and is in comma of troops possessing higher moral than the enemy.

The paramount importance of the production of v quantities of munitions of war is therefore obvio There is a plentiful quantity of all that goes to production of matériel in the various countries formi the Germanic alliance, but it is questionable whet the complications of war permit the enemy to make use of his resources.

Coal is necessary in the manufacture of steel, but c is equally necessary for the conveyance of materi to the steel-producing plants. The normal transport the troops cannot in any way be reduced, because Krupp factories are short of the various substan proper to their business. The question of supply complicated by shortage of labour consequent on losses in man-power, and, to a degree, on the reducti in the national physique owing to food shortage. things in the national life are interwoven and int dependent.

KINDLY MENTION "THE AEROPLANE" WHEN CORRESPONDING WITH ADVERTISERS.

Increased Production.

There cannot be an increase in the production of aeroplanes in an efficient State (an inefficient State might increase production by a change of method) without a consequent reduction in the supply of some other instrument of war. If greater quantities of the 5 in. howitzer are constructed, then the number of new guns of another category will lessen in some manner.

All these considerations apply, also, to ourselves and our Allies, but to a lesser degree. The possession of the freedom of the seas enables us to place contracts for matériel in neutral countries, thus reducing the necessary construction within our own borders. The question of the supply of labour does not affect us greatly. Our favoured position in this matter cannot fail to improve our chances in the war.

The necessities of the case have induced the German and his subordinate allies to concentrate on specialised instruments of war. For instance, it is said that he has realised the high virtues of a particular category of big gun, and has in consequence reduced his output of other types in order that he may produce enormous quantities of that on which he places special reliance.

Reduction of Types.

In aeronautics he would appear to have definitely tabulated his types of aircraft. In consequence, if report be true, he has eliminated machines of a design which, while excellent in its way, is not absolutely essential. His resources in this matter are directed to the building of a few designs of special excellence, each of which has been drafted with a clearly defined object.

He knows, or believes he knows, the best machines under present conditions for such widely different duties as strategical reconnaissance, spotting for artillery, long-distance bombing raids, and aerial fighting. Whether his types are well chosen or not, there is definite gain in the reduction of the number of types in course manufacture. It is far easier to produce 1,000,000 Fo motor-cars in a given time than it is to turn o 100,000 each of ten cars of different design ranging fr the Rolls-Royce to the Bugatti, assuming for the sa of argument that the quality of production is the sa in all cases.

And so it is through all the different branches of t productive side in the German military machi Everything has been simplified in so far as is possib Therefore, if we are in the advantage as to the quanti of production, how much more shall we be superior this matter if we, too, co-ordinate to a similar degre

The Press—in Parenthesis.

En parenthèse it might be well to extend the ope tion into the domain of the Press, and have one ne paper devoted to agitation and the dissemination the lies of the Clubs and Tower Hill, another to as official admirer to the Government in power, one tell us how inefficient the professional soldier is on occasions, and another to uphold his reputation as sober Christian. People can construct their own li of a pleasant Press. Fleet Street might be sadder, b there would be amusement in the world for a space.

There is a pleasant attraction in the idea of an am gamated paper penned from the Press of to-day—a co bined "Daily Mail," "John Bull," and "Pol Gazette." Think, too, of a paper entirely devoted the praise of Selfridge instead of illimitable adverti ments in many journals! Such a change might ev help to win the war. But this is a digression.

The Food Question.

The food question is no more trouble to the Centr Powers than it was at the time of the last articles this series. In truth, it has probably improved great

GERMAN AIRCRAFT PRODUCTION.—Drilling small parts with a very neat form of electric sensitive drill. One does not notice any evidence of acute starvation. The chalked notice at the back means "Beware of Pick-pockets," which may imply inherent moral obliquity among the working classes, or may be only a joke, or may be an evidence of acute starvation.

SAFE BEHIND 'TRIPLEX'

There is No substitute for
"TRIPLEX"

The ONLY Safety Glass.

"Triplex is in a class by itself. It has proved its wonderful merit on active service at home and at the front. Refuse all imitations. There is only one "Triplex." Best for Goggles, Windshields, Windows, and Observation Panels in the centre section or lower wings. Successfully used and approved by H.M. Government and all leading aviators and motorists.

Telling Testimony.

"I thought you would like to see the Triplex Goggles I was wearing when I had my smash. You will see both eyepieces are cracked in innumerable places, and the force of the blow actually bent the aluminium frame. There is no doubt Triplex saved both my eyes, as they would have been done for with any ordinary glass."

Original can be seen at any time.

Investigate "Triplex." Illustrated Catalogue on request.

THE "TRIPLEX" SAFETY GLASS CO., LTD.
1, Albemarle Street, Piccadilly, London, W.
Telephone: Regent 1340. Telegrams: "Shatterlys, Piccy, London."

The above is an actual photograph of the Goggles referred to in the accompanying letter.

In the first few months of the war people were disinclined to order their lives on a simpler scale than had commonly obtained in the days of peace and unrestrained luxury. The same extravagance and the same waste continued until the unexpected duration of the war brought about a shortage.

The lack of customary articles of food was then felt with an intensity that always accompanies the breaking of established habit. The Englishman for generations has been accustomed to eat bacon at his breakfast. In France he finds it is not usual, and he at once assumes that France must be immoral.

The lapse of time since the war began—a space of three years filled with the experience of a generation of peace—has reduced the rations of the civilian to a habit scarcely less strong than that of the days of plenty. The shortage of meat has been less noticeable of recent months, in so far as the general public of enemy countries is concerned, than a bad champagne year was formerly, as felt by the world in general.

With experience, the enemy has learnt how to conserve such food as he has within his borders. There has been a growing equalisation of supply throughout all the allied countries. A little thought will indicate, even to those to whom an atlas and the knowledge which it conceals has no attraction, what vast sources of food supply are still in the hands of the Kaiser's legions. Few things are certain in this world, but among them must be included the certainty that land in German possession is not producing less in these days than in previous years. Certain it is that the area behind the German lines in France has been cultivated this year with no less intensity than in pre-war days.

In addition to the growth of new habit and the better distribution of the food, it is probable that large supplies have entered Germany and Austria from Russia. The Russian battle line has been undecided and indeterminate since His Imperial Majesty the Tsar was imprisoned by his rebellious subjects, and it is unlikely that the Germans have lost any opportunity of taking material advantage of the existing position.

Unity and Co-ordination.

The duration of the war and the decision as to the ultimate victory remain entirely in the hands of the Allies. If we remain united and wait until the return of peace for the settlement of our varied troubles, then it is certain that we will be the victors. With true unity and co-ordination of effort, there is little reason why the war should not end during the early summer of 1918.

If, on the other hand, disunion enters into the Alliance, the end of the war will be postponed indefinitely, and there is a chance of Germany being the victor. The defection of Russia, which must be regarded as a possibility if not actually a probability, will prolong the war for months and even for years.

Given a continuance of present conditions, the end of the war is in sight, but little is certain in human existence. One thing is certain—talk will do little, action alone can help towards victory.

A LONDON MEETING.

On Wednesday, October 3rd, a public meeting will be held at the Central Hall, Westminster, at 8 p.m., in support of an agitation for an Increased Air Service.

The meeting is being organised by the National Imperial Association, and the chair will be taken by Mr. F. M. Russell Davies.

The speakers will be Mr. W. Joynson-Hicks, M.P., and Mr. J. H. Havelock Wilson, who are to be supported by the Mayors of London Boroughs, East Coast Towns, and other influential persons.

A limited number of reserved tickets are to be had for 5s. and 2s. 6d. each. Other seats are free.

Applications for tickets should be addressed to the hon. secretary of the Association, at 109, Victoria Street, Westminster, S.W.

THE AERONAUTICAL HISTORY EXHIBITION.

Mr. Asquith has promised to perform the opening ceremony at the Air Service Exhibition to be inaugurated in Leeds on September 27th. The Exhibition is under the auspices of the Army Council and the Air Board, and was organised by the Countess of Drogheda in aid of the Flying Corps Hospital.

THE R.F.C. HOSPITAL FUND.

The Overseas Club has handed over a further cheque for £4,000 to Lady Henderson on behalf of the Royal Flying Corps hospitals. This brings the total collected by Overseas Club members for this fund to £16,000.

A WARNING OF INVASION.

Lieut. General Sir Francis Lloyd, G.O.C. the London district, in opening a fête at Brunswick Park, Camberwell, on Sept. 13th, warned the country to be prepared for the possibility of invasion. The fête was on behalf of the Mayor of Camberwell's Fund for removing the debts on the newly-acquired headquarters of the Camberwell Battalion of the London Regiment of Volunteers. The Mayor, Alderman Thomas Coombs, presided.

Sir Francis Lloyd said that never did we more require every possible man, either to fight or to be ready to fight, than at the present moment. As was well known, it was quite a possibility that we might have to fight here. Let them look at the determination of the enemy, not only in fighting at the front, but in invading this country by aircraft. And, undoubtedly, their determination to bring every possible method to bear against us was indicated by the way they had abandoned the Zeppelin method when they found that they did not meet with great success, and turned to the more difficult form by large aeroplanes, with which they had been invading Great Britain recently.

"Do you think," he asked, "they are likely to stop at that if they get the chance? It is quite possible that if they find that the game is up they will make one last and determined throw to invade this country, and so to turn the tables upon us, and for that we must be absolutely prepared."

A MOTION.

Councillor J. Mitchell, of Westcliffe-on-Sea, intends at the next meeting of the Southend Council to move the following resolution :—

"That the town clerk be instructed to write to Mr. Rupert Guinness, M.P., for South-East Essex, and request him to furnish full particulars of any action he may have taken to convince the Government of the urgent and immediate necessity for air reprisals which, in the opinion of this council, would tend to prevent the women and children of this borough from being murdered."

He suggests that every council should pass a similar resolution, and says :—

"Then M.Ps. will recognise that, failing a satisfactory answer, their services will not be required after the next election."

EDITORIAL NOTICE.

Arrangements have been made to publish each week, commencing September 26th, a special article commenting upon all matters connected with or relating to Companies affiliated or kindred to the Aircraft Industry.

This feature will be contributed by a well-known specialist in financial matters, and will deal particularly with—

Company Reports and Official Notices.

Stock Exchange Quotations.

Treasury and Stock Exchange Regulations and By-laws.

The notification of, and advice regarding, new Capital Issues.

Criticism and publication of Directors' Reports and Balance Sheets.

A special feature of the contribution will be "Replies to Correspondents," whose enquiries will be answered free of charge in these columns.

Special Note.

The Editor will feel obliged to Secretaries and other Company Officials if they will kindly address all Company Notices and Balance Sheets, as and when published, to the "Finance Editor," The Aeroplane, 166, Piccadilly, London, W.1.

Woods, North'd R., T.F.; Lt. E. R. H. Pollak, R.F.A., T.F.; temp. Sec. Lt. B. A. Taylor, Gen. List; temp. Lt. E. Newling, Gen. List; Lt. B. James, Spec. Res.; Lt. D. S. Evans, Spec. Res.; Sec. Lt. T. E. Gorman, Spec. Res., Aug. 27th.

Balloon Co. Comdrs. (graded as Flt. Comdrs.).—Capt. P. G. Bateman, Lond. R., T.F., from a Balloon Comdr., Aug. 17th. And to be temp. Capts. whilst so empld. :—Lt. T. G. G. Bolitho, M.C., Spec. Res., from a Balloon Comdr., Aug. 19th. Sec. Lt. (temp. Lt.) R. Hofmeyer, Yorks L.I., from a Balloon Officer, Aug. 25th.

Adjt.—Lt. G. Philippi, M.C., Dns., Spec. Res., from a Flying Officer, and to be temp. Capt. (with pay and allowances as Lt.) whilst so empld., Aug. 23rd.

Special Appt. (graded as an Equipment Officer, 1st Cl.).—Lt. (temp. Capt.) O. G. W. G. Lywood, Norf. R., from a Flt. Comdr., and to retain his temp. rank whilst so empld., Aug. 23rd.

Schools of Instruction.—Schools of Aerial Gunnery.—Chief Instr. (graded as a Sqdn. Comdr.).—Lt. (temp. Capt.) W. A. Bishop, V.C., D.S.O., M.C., Canadian Local Forces, from a Flt. Comdr., and to be temp. Maj. whilst so. empld., Aug. 28th.

Central Flying School.—Instr.—Temp. Lt. (temp. Capt.) H. M. Sison, M.C., A.S.C., from a Flt. Comdr., vice Sec. Lt. (temp. Maj.) A. M. Vaucour, M.C., R.A., Aug. 22nd.

War Office, Sept. 12th.

REGULAR FORCES—Establishments.—R.F.C.—Mil. Wing.—Flt. Comdrs.—From Flying Officers, and to be temp. Capts. whilst so empld. :—Lt. D. H. M. Carlery, R.A., August 26th. Lt. S. B. Horn, D. Gds., August 29th.

Gen. List.—Flt. Sgt. E. H. Lawford to be temp. Sec. Lt., July 21st.

Memorandum.—Temp. Hon. Lt. A. B. Rogers to be temp. Hon. Capt. whilst empld. as Inspr., Aeron. Inspn. Dept., Dec. 9th, 1916.

War Office, Sept. 13th.

REGULAR FORCES.—Staff.—Temporary Appointments at the War Office.—Asst. Dir.—Temp. Lt.-Col. R. F. Drury, Gen. List, from a Dep. Asst. Dir., August 18th, 1917.

Dep. Asst. Dirs.—August 18th, 1917: Temp. Maj. A. Struben, Gen. List, from a Staff Capt., vice temp. Lt.-Col. R. F. Drury, Gen. List; Sec. Lt. (temp. Capt.) E. E. Robb, R.F.C., Spec. Res., from an Equipment Officer, 1st Cl., and to retain his temp. rank whilst so empld.

G.S.Os., 3rd Grade.—Maj. J. K. N. V. Bunbury, R. W. Surr. R., Spec. Res., August 22nd, 1917. Capt. H. G. Money, Middx. R., and to be secd. August 22nd, 1917.

Staff Capts.—Temp. Capt. F. R Freeman, Gen. List, vice temp. Maj. A. Struben, Gen. List, August 18th, 1917.

Establishments. — R.F.C. — Sqdn. Comdrs. — From Flt. Comdrs., and to be temp. Majs. whilst so empld.: Capt. G. Allen, Conn. Rang., February 11th, 1917. Lt. (temp. Capt.) F. C. Sherren, M.C., Canadian Local Forces, August 1st, 1917. Sec. Lt. (temp. Capt.) J. O. Archer, R.F.A., Spec. Res., Sept. 10th, 1917.

Flt. Comdrs.—From Flying Officers and to be temp. Capts. whilst so empld.: Sec. Lt. (temp. Lt.) G. Aste, A.S.C., Spec. Res., August 1st, 1917. Lt. J. W. Francis, Spec. Res., August 28th, 1917. Lt. G. C. Rogers, Canadian Local Forces, August 31st, 1917. Capt. (temp. Maj.) A. G. Moore, M.C., Manch. R., Spec. Res., reverts from a Sqdn. Comdr., and relinquishes his temp. rank, August 27th, 1917, with seniority from Jan. 27th, 1916.

Balloon Co. Comdr.—(Graded as a Flt. Comdr.).—Lt. G. B. Robotham, Notts. and Derby. R., T.F., from a Balloon Comdr., and to be temp. Capt. whilst so empld., August 25th.

Adjt.—Capt. T. B. Hornblower, R. Suss. R., T.F., and to be secd., July 30th.

Gen. List.—Sec. Lt. H. O. Fellowes, Sea. H., T.F., to be temp. Capt. (without the pay or allowance of that rank) whilst empld. as Adjt., August 15th, 1917.

War Office, Sept. 14th.

REGULAR FORCES—Establishments.—R.F.C.—Mil. Wing.—Wing Comdr.—Capt. (temp. Maj.) J. C. Halahan, Res. of Officers from a Sqdn. Comdr., and to be temp. Lt.-Col. whilst so empld., Sept. 1st.

Spec. Appts.—(Graded as Sqdn. Comdrs.).—From Flt. Comdrs. and to be temp. Majs. whilst so empld.:—Temp. Capt. S. E. Parker, Gen. List, Aug. 23rd. Lt. (temp. Capt.) C. H. Nicholas, S. Wales Bord., Spec. Res., Aug. 27th.

* * *

The King has been pleased to approve of the award of the following honours, decorations, and medals to Officers and Men for services in action with enemy Submarines:—

Distinguished Service Cross.

Flt. Lt. (Actg. Flt. Comdr.) Osborne Arthur Butcher R.N.A.S.
Flt. Lt. John Osborne Galpin, R.N.A.S.
Lt. John Henry Blyth, R.N.R.
Flt. Sub-Lt. Charles Leslie Young, R.N.A.S.

Bar to the Distinguished Service Cross.

Flt. Lt. Warren Rawson Mackenzie, D.S.C., R.N.A.S.

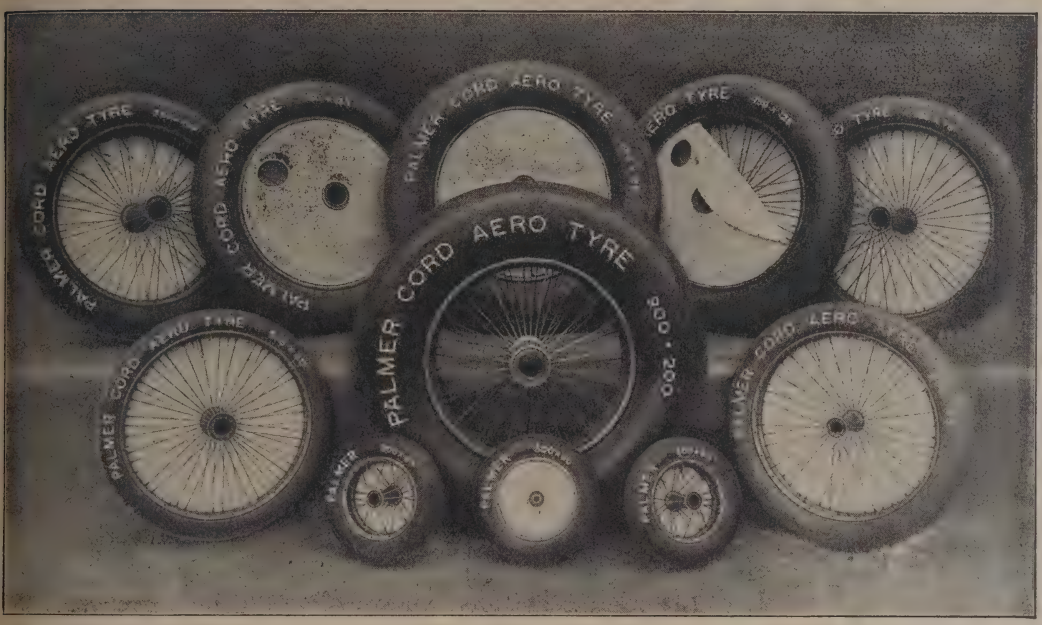
Distinguished Service Medal.

Air Mech., 1st Gr., Henry Leslie Curtis, O.N. F24994; Air Mech., 2nd Gr., William Henry Grey, O.N. F6068.

* * *

The following Officers and Man have been mentioned in dispatches:—

Flt. Sub-Lt. Sidney Ernest Ball, R.N.A.S.
Flt. Sub-Lt. Arthur Thomas Barker, R.N.A.S.
Air Mech., 2nd Gr., Walter James Priest, O.N. F21948.



* * *

The King has been pleased to approve of the award of a Bar to the Distinguished Service Order to the following Officer:—

Flt. Lt. (Actg. Flt. Comdr.) Robert Alexander Little, D.S.O., D.S.C., R.N.A.S.

For exceptional gallantry and skill in aerial fighting. On July 16th he observed two Aviatiks flying low over the lines. He dived on the nearest one, firing a long burst at very close range. The enemy machine dived straight away, and Flt. Lt. Little followed him closely down to 500 ft., the enemy machine falling out of control. On July 20th, he attacked a D.F.W. After a short fight the enemy machine dived vertically. Its tail plane seemed to crumple up, and it was completely wrecked. On July 22nd, he attacked a D.F.W. Aviatik, and brought it down completely out of control. On July 27th, in company with another pilot, he attacked an Aviatik. After each had fired about 20 rounds, the enemy machine began to spin downwards. Flt. Lt. Little got close to it, and observed

PALMER
CORD TYRES and WHEELS
For AEROPLANES

PALMER CORD AERO TYRE
PALMER CORD AERO TYRE
PALMER CORD AERO TYRE

both the occupants lying back in the cock-pits, as if dead. The machine fell behind the enemy's lines, and was wrecked. Flt. Lt. Little has shown remarkable courage and boldness in attacking enemy machines.

DISTINGUISHED SERVICE CROSS.

Flt. Lt. (Actg. Flt. Comdr.) Robert Jope Slade, R.N.A.S.

For his services during a bombing raid on Snelleghem Aerodrome on August 5th. He was attacked by an enemy machine when leaving the target. After firing about thirty rounds the hostile machine appeared to lose control and suddenly dived without regaining it.

Flt. Lt. (Actg. Flt. Comdr.) William Melville Alexander, R.N.A.S.

On August 16th he attacked at about 3,000 ft. two hostile scouts, one of which, after a short combat, fell completely out of control. On August 20th, while returning from patrol, he observed three enemy scouts. These he pursued until they turned to fight. One of the scouts he shot down completely out of control, and the remaining two dived away. On August 21st, while on an offensive patrol, he attacked and drove down completely out of control an enemy scout, which was attacking another member of his patrol. Flt. Lt. Alexander has at all times shown the greatest bravery and determination.

Flt. Sub-Lt. Charles Philip Oldfield Bartlett, R.N.A.S.

For exceptionally good work on the occasion of a bombing raid on Houttave Aerodrome on July 25th, 1917.

BAR TO THE DISTINGUISHED SERVICE CROSS.

Flt. Comdr. Irwin Napier Colin Clarke, D.S.C., R.N.A.S.

For exceptionally good work on the occasion of a bombing raid on Houttave Aerodrome on July 25th, 1917. This officer has shown great skill and persistence in leading his flight on many occasions.

DISTINGUISHED SERVICE MEDAL.

Air Mech., 1st Gr., Edward Darby, O.N. F849; Air Mech., 1st Gr., William David Sambrooke, O.N. F6630.

* * *

The following Officers have been mentioned in dispatches :—

Flt. Comdr. Charles Teverill Freeman, D.S.C., R.N.A.S.
Flt. Comdr. Thomas Frederick Le Mesurier, D.S.C., R.N.A.S.

* * *

THE FOLLOWING DECORATIONS HAVE BEEN CONFERRED BY THE PRESIDENT OF THE FRENCH REPUBLIC :—

LEGION OF HONOUR.

OFFICIER.

Capt. Charles L. Lambe, D.S.O., R.N.
Comdr. Henry C. Halahan, D.S.O., R.N.

CHEVALIER.

Sqdn. Comdr. Francis K. Haskins, D.S.C., R.N.
Sqdn. Comdr. Douglas C. S. Evill, D.S.C., R.N.
Sqdn. Comdr. Redford H. Mulock, D.S.O., R.N.A.S.

WAR OFFICE, Sept. 15th.

REGULAR FORCES.—STAFF.—ATTD. TO HEADQUARTER UNITS. —Brig. Comdr.—Maj. (temp. Col.) T. C. R. Higgins, R. Lanc. R., and to be temp. Brig.-Gen. whilst so empld., Sept. 1st, 1917.

ESTABLISHMENTS.—R.F.C.—MIL. WING.—Wing Comdr.—Capt. (temp. Maj.) C. T. Maclean, M.C., R. Sc. Fus., from a Sqdn. Comdr., and to be temp. Lt.-Col. whilst so empld., Aug. 21st.

Flt. Comdrs.—From Flying Officers, and to be temp. Capts. whilst so empld. :—Temp. Lt. E. S. Moulton-Barrett, Gen. List; Lt. C. A. Lewis, M.C., Spec. Res.; Sec. Lt. (Lt., Canadian Mila.) L. P. Watkins, Spec. Res.; temp. Sec. Lt. G. G. Boyton, Gen. List, Aug. 1st. Temp. Lt. N. Goudie, Gen. List; Lt. H. H. Griffith, Spec. Res., Aug. 27th; temp. Sec. Lt. H. Kirton, Gen. List., Sept. 1st.

Balloon Co., Comdrs.—(Graded as a Sqdn. Comdr.).—Capt. G. F. H. Faithfull, Ind. Army, and to be temp. Maj. whilst so empld., Aug 30th, but with seny., without pay or allowances, Dec. 5th, 1916. (Graded as a Flt. Comdr.).—Lt. T. G. Thornton, York. R., T.F., from a Balloon Comdr., and to be temp. Capt. whilst so empld., Aug. 30th.

Gen. List.—Sgt. J. F. Ridgway, from R.F.C., to be temp. Sec. Lt., Aug. 27th.

WAR OFFICE, Sept. 17th.

REGULAR FORCES—ESTABLISHMENTS.—R.F.C.—MIL. WING. —Flt. Comdrs.—From Flying Officers, and to retain their temp. rank while so empld. :—Temp. Capt. G. H. Gordon, Gen. List; Lt. (temp. Capt.) G. G. Hubbard, Spec. Res., Sept. 1st. Temp. Sec. Lt. C. O. B. Beale, D.S.O., Gen. List, from a Flying Officer, and to be temp. Capt. while so empld., Sept. 2nd.

Gen. List.—S.Q.M.S. Walter Daughton, from R.F.C., to be temp. Sec. Lt., Aug. 24th.

Officers who have been granted temp. rank or temp. commns. under "Memoranda" for duty with R.F.C., are now granted such temp. rank or temp. commns. on Gen. List, R.F.C., retaining their present seny.

MEMORANDUM.—Lt.-Col.C. O. Smeaton, C.B., h.p. list, retires on ret. pay, Aug. 3rd, 1917.

The King has been pleased to approve of the following Reward for distinguished service in the Field :—

DISTINGUISHED SERVICE ORDER.

Maj. (temp. Lt.-Col.) Norman Duckworth Kerr Macewen, Arg. and Suth'd Highrs. and R.F.C.

* * *

The names of the following have been brought to the notice of the Secretary of State for War for valuable services rendered in connection with military operations in the Field :—

ROYAL FLYING CORPS.

Floyer, Lt. E. A., I.A.R.O. and R.F.C.; Henderson, Lt. T., R.E. and R.F.C.; Leeson, Sec Lt. B. E., Ches. R. and R.F.C.; Ross, Maj. A. J., D.S.O., R.E. and R.F.C.; Siddons, Sec. Lt. V. D., North'n R. and R.F.C.; Stafford, Sec. Lt. W. G., Gen. List; Stent, Lt. (temp. Capt. in Army) F. W., R.F.C. (Spec. Res.); Thomson, Sec. Lt. (temp. Lt.) D. N., Yeo. and R.F.C.; Catchpole, No. 6737 Cpl. C. J.; Colwill, No. 1859 Cpl. R.; Gibson, No. 1753 Flt. Sgt. G. A. F.; Pound, No. 3030 1st Cl. Air Mech. F.; Teasdale, No. 16933 Cpl. C. E.; Warr, No. 5986 1st Cl. Air Mech. C. J.; Wilder, No. 8268 1st Cl. Air Mech. J. F.; Wright, No. 2567 Sgt. H. H.

[These appear to be in connection with operations from Egypt.—Ed.]

* * *

The King has been pleased to approve of the appointments of the following Officers to be Companions of the Distinguished Service Order in recognition of their gallantry and devotion to duty in the field :—

Sec. Lt. (Temp. Capt.) William Charles Campbell, M.C., R.F.C., Spec. Res.

For conspicuous gallantry and devotion to duty on numerous occasions whilst on offensive patrols. He has displayed the greatest courage and skill in attacking enemy aircraft at close range, destroying some and driving others down out of control. He has proved himself to be a scout leader of the highest class, and has destroyed 12 hostile machines and two balloons, besides taking part in many other combats during the last three months. By his fearlessness and offensive spirit he has set a splendid example to all ranks.

Lt. (Temp. Capt.) William John Charles Kennedy-Cochran-Patrick, M.C., Rif. Bde. and R.F.C.

For conspicuous gallantry and devotion to duty on numerous occasions in destroying and driving down hostile machines, frequently engaging the enemy with great dash and a fine offensive spirit when encountered in superior numbers. By his cool judgment and splendid fearlessness he has instilled confidence in all around him, his brilliant leadership being chiefly responsible for his numerous successes.

Sec. Lt. (Temp. Capt.) Harold Melsome Probyn, R. War. R., and R.F.C.

At a critical time when hostile infantry had penetrated our trenches, he went up in unfavourable weather, and under heavy machine-gun and anti-aircraft fire from guns of heavy calibre and managed to locate and report with complete accuracy the position and progress of the enemy. To do this he had to fly at a very low altitude, during which his machine was seriously damaged by enemy fire. The following day he carried out another daring and successful reconnaissance of the enemy's lines, bringing back information of the greatest value. He has already experienced a whole year's strenuous service flying, a fact which speaks for his gallantry and endurance on both of these particular occasions.

Sec. Lt. Alfred Seymour Shepherd, M.C., R.F.C., Spec. Res.

For conspicuous gallantry and devotion to duty on numerous occasions when engaged in combat with hostile aircraft. Though surrounded by enemy machines, he continued to fight for nearly an hour with the utmost gallantry and determination against two hostile formations, finally bringing down one of the enemy out of control. Within a month he brought down seven hostile machines completely out of control.

Lt. (Temp. Capt.) John Whitaker Woodhouse, M.C., R.F.C., Spec. Res.

For conspicuous gallantry and devotion to duty in carrying out special missions by night, during which he has frequently been compelled to face very bad weather. In the course of numerous bombing expeditions by night he invariably descended to very low altitudes in order to use his machine gun against hostile troops on the roads. He has consistently set a very fine example.

* * *

The King has been pleased to award a Bar to the Military Cross to the undermentioned Officers :—

Temp. Lt. Louis Fleeming Jenkin, M.C., Gen. List and R.F.C.

For conspicuous gallantry and devotion to duty in continually attacking hostile aircraft at close range, destroying some and driving others down out of control. His dash and offensive spirit have at all times been admirable. (M.C. gazetted August 16th, 1917.)

Sec. Lt. (Temp. Capt.) Arthur Gordon Jones-Williams, M.C., Welsh R. (attd. R.F.C.)

For conspicuous gallantry and devotion to duty when

engaged in combat with hostile aircraft. On several occasions he attacked enemy formations although they were in superior numbers, fighting them in more than one instance single-handed, and showing the finest offensive spirit. He drove several machines down completely out of control, fighting until his ammunition was expended. (M.C. gazetted July 18th, 1917.)

Sec. Lt. Arthur Percival Foley Rhys-Davids, M.C., R.F.C., Spec. Res.

Whilst on offensive patrols, he has in all destroyed four enemy aircraft, and driven down many others out of control. In all his combats his gallantry and skill have been most marked, and on one occasion he shot down an enemy pilot who had accounted for 29 Allied machines. His offensive spirit and initiative have set a magnificent example to all. (M.C. gazetted July 18th, 1917.)

* * *

The King has been pleased to confer the Military Cross on the following Officers in recognition of their gallantry and devotion to duty in the Field :—

Temp. Lt. Percy John Barnett, Gen. List and R.F.C.

For conspicuous gallantry and devotion to duty on many occasions. His reconnaissance work has been particularly daring and successful owing to the pluck and determination with which he has faced bad weather and attacks from hostile aircraft in order to obtain his information. He has taken part in 10 successful bomb raids, and his keenness on all occasions has set a splendid example to others.

Lt. (Temp. Capt.) Geoffrey Hilton Bowman, R. War. R., Spec. Res. and R.F.C.

He had taken part in many offensive patrols, which he led on twenty occasions, in the course of which four enemy aircraft were destroyed and twelve others were driven down out of control. Although outnumbered by five to one on one occasion he handled his patrol of four machines with such skill and gallantry that after a very severe fight he was able to withdraw them without loss, having destroyed at least two enemy machines and driven down one out of control. His fearlessness and fine offensive spirit have been a splendid example to others.

Sec. Lt. (Temp. Capt.) Keith Logan Caldwell, R.F.C., Spec. Res.

For conspicuous gallantry and devotion to duty when leading offensive patrols. On one occasion he led a patrol of five machines against 12 hostile aircraft, all of which he drove down out of control. He has personally destroyed five hostile machines and has had over 50 contests in the air, in all of which he has displayed splendid skill and fearlessness, and has set an excellent example to his squadron.

Sec. Lt. William Charles Cambray, R.F.C.

For conspicuous gallantry and devotion to duty whilst acting as observer to offensive patrols. On four occasions at least he has shot down enemy scouts, and has also had numerous indecisive combats, in all of which he has displayed the greatest gallantry.

Sec. Lt. (Temp. Capt.) Alfred John Michell Clarke, Glouc. R., and R.F.C.

He has led 14 bomb raids, the majority of them against distant objectives, and his gallantry and skill have inspired the greatest confidence. Although continually heavily attacked by enemy aircraft, he has successfully inflicted considerable damage upon his opponents, as well as upon his objectives.

Sec. Lt. (Temp. Capt.) Arthur Coningham, R.F.C., Spec. Res.

For conspicuous gallantry and devotion to duty in attacking enemy aircraft. On numerous occasions he has displayed great dash and fine offensive spirit in engaging the enemy at close range, and driving them down completely out of control.

Sec. Lt. John Clive Currie, R.F.A., Spec. Res., attd. R.F.C.

For conspicuous gallantry and devotion to duty when acting as observer to another officer. They faced a violent thunderstorm, accompanied by a gale of wind and blinding rain, which had compelled all other machines to return to their aerodromes or to make forced landings, in order to locate the position of our infantry in the front line. This they successfully did, having spent one and a half hours in the air under fearful conditions, and returned with an accurate and valuable report to headquarters.

Lt. (Temp. Capt.) Frank Fernihough, R.F.A. and R.F.C.

In artillery observation and patrol work he has continually distinguished himself by his fearlessness and determination to gain information, undeterred by hostile fire or adverse weather conditions, remaining unshaken through some very trying experiences, during one of which his machine was very badly hit and his observer's leg was shot away. He has furnished information of the greatest value on numerous occasions.

Sec. Lt. (Temp. Lt.) Arthur Willoughby Falls Glenny, A.S.C., and R.F.C.

For conspicuous gallantry and devotion to duty when in co-operation with artillery. By dint of great perseverance, skill, and very gallant flying he has accomplished splendid work under very difficult circumstances. On one occasion, during a gale of wind, he successfully ranged three of our heavy batteries upon an enemy battery, which was completely obliterated. He has consistently set a very fine example to his squadron.

Sec. Lt. (Temp. Capt.) Geoffrey Herbert Hooper, R.E., attd. R.F.C.

When leading a patrol of four machines he attacked 10 enemy aircraft : during the engagement five of them were destroyed, two by himself. He had previously led a very successful night bombing attack on an aerodrome, in unfavourable weather dropping bombs from a very low altitude, and doing a great amount of damage. He has invariably displayed great gallantry and skill when engaged in aerial combats.

Temp. Sec. Lt. Walter James Hodgson-Horrocks, Gen. List and R.F.C.

For conspicuous gallantry and devotion to duty as a balloon observer. Although under accurate hostile shell fire, he remained in observation in spite of both balloon and basket having been hit by shell splinters, locating the gun which was shelling him, and refusing to descend until darkness made observation impossible. A few moments after he had descended the balloon was brought down by a direct hit. He has always shown remarkable energy and determination whilst engaged in observing.

Sec. Lt. (Temp. Lt.) Campbell Alexander Hoy, R.F.C.

When acting as observer on offensive patrols, on four occasions he has shot down hostile scouts, displaying in every instance splendid determination and a very fine offensive spirit.

FROM THE COURT CIRCULAR.

Windsor Castle, Sept. 12th.

The following Officer had the honour of being received by His Majesty at Buckingham Palace, when the King invested him with the Insignia of Companion of the Order into which he was admitted.

The Distinguished Service Order.

Capt. John Larkin, King's Own Scottish Borderers, attd. R.F.C.

His Majesty then conferred decorations as follows :—

The Military Cross.

Maj. Charles Blount, R.F.C.
Capt. William Barclay, R.F.C.
Capt. Percy Worthington, R.F.C.
Lt. John Aldred, R.F.C.
Sec. Lt. James Tennant, Cameron Highlanders, attd. R.F.C.
Sec. Lt. Eric Wilson, R.F.C.

NAVAL.

The following appointments have been made in the Royal Naval Air Service :—

Sept. 12th.—Sqdn. Comdr.—C. D. Breese has been promoted to rank of Actg. Wing Comdr., Sept. 8th.

Temp. Lt. (R.N.V.R.).—F. Atkinson has been reappointed as Actg. Lt. Comdr., R.N.V.R., April 1st.

Sept. 14th.—Actg. Lt., R.N. (Flt. Sub-Lt.) M. McMaster promoted to Flt. Lt., with seniority August 15th.

Sept. 14th.—A temp. commn. as Lieut., R.N.V.R., has been granted to Mr. H. S. Slade, Sept. 8th.

Admiralty Communiqués.

Sept. 11th.—During the last few days, owing to unfavourable weather, operations by naval aircraft have been restricted.

In operations which have taken place, however, one enemy aircraft was shot down and another driven down out of control.

Bombs have been dropped on Houttave Aerodrome (about five miles north-west of Bruges), but owing to bad visibility results could not be observed.

All our machines have returned safely.

Sept. 12th.—During the last 24 hours many fighter patrols have been carried out by the Royal Naval Air Service.

One of these patrols engaged two enemy spotting machines, one being shot down, the machine crashing into the sea, the other landing almost intact in our lines. The pilot and observer of the latter machine were made prisoners.

Two other enemy machines were attacked and driven down during a sweep by our machines.

In conjunction with a bombing raid nine enemy machines were encountered, five of which are believed to have been driven down out of control.

Bombing raids were carried out by night on—

St. Denis Westrem aerodrome (south-west of Ghent).
Gontrode aerodrome (south-east of Ghent).
Bruges docks.

GLASGOW.

Thourout railway junction (about 11 miles east-north-east of Dixmude).

Railway objectives near Ghent.

Several tons of explosives were dropped.

During the forenoon of Sept. 11th a bombing raid was made on Sparappelhoek, Thourout aerodrome, and Engel (north-west of Thourout) ammunition dump. At Sparappelhoek bombs were observed to explode amongst the hangars, causing much smoke, and at Thourout a direct hit was observed on a hangar. At Engel ammunition dump a large fire was caused.

The bombing formation was attacked by enemy machines, and one of the latter was shot down smoking and out of control. Many tons of explosives were dropped

In all the operations referred to all machines and pilots returned safely.

SEPT. 13th.—During the 11th and 12th inst., in spite of poor visibility, the following bombing raids by naval aircraft have been carried out :—

1. Thourout aerodrome and dumps, on which objectives several tons of bombs were dropped, and a heavy explosion was caused.

2. Bruges docks, where an explosion was also caused.

3. A further bombing raid was attempted on Bruges dock, but owing to thick clouds the shipping alongside Zeebrugge Mole was attacked instead. A direct hit was made on a large destroyer, and several direct hits on seaplane sheds and Mole, causing a fire.

All our machines returned safely.

SEPT. 14th.—A bombing raid was carried out during the night of 12th-13th by the Royal Naval Air Service on the following military objectives :—

Ghistelles Aerodrome.

Thourout Aerodrome.

A large quantity of bombs was dropped.

All machines returned safely.

SEPT. 17th.—Naval aircraft carried out a bombing raid on September 15th on enemy shipping between Ostend and Blankenberghe. Bombs were dropped on destroyers and trawlers or drifters.

One large destroyer was hit amidships and one, probably two, out of a group of four trawlers, was sunk.

In the evening during a late patrol one of our seaplanes was attacked by two seaplanes, which were engaged by our escorting aeroplanes and one shot down in flames, the other being chased towards some enemy destroyers.

At about 10 a.m. yesterday (September 16th) a patrol engaged a formation of enemy aircraft, destroying one and probably a second.

THE CASUALTY LIST.

Reported Sept. 13th.

MISSING.—Adlam, Flt. Sub-Lt. L. A., R.N.

KILLED ACCIDENTALLY.—Blackstock, C. R., Aircftmn., 2nd Gr., F22904.

Reported Sept. 17th.

KILLED.—Wood, Flt. Comdr. C. E., R.N.

Benjamin, Lt. J. D., R.N.R.

ACCIDENTALLY KILLED.—Bettington, Actg. Sqdn. Comdr. A. F., R.N.

MISSING, FEARED LOST.—Cripps, Flt. Sub-Lt. J. W. D., R.N.

MISSING.—Wilford, Flt. Sub-Lt. J. R., R.N.

Abbott, Flt. Sub-Lt. E. D., R.N.

ACCIDENTALLY INJURED.—de Ville, Actg. Flt. Comdr. E. A. de L., R.N.

Lavington, Flt. Sub-Lt. G. W., R.N.

Cole, Flt. Sub-Lt. J. A., R.N.

Wood, Proby. Flt. Officer K. S., R.N.

Lester, Proby. Flt. Officer H. L. P., R.N.

SLIGHTLY INJURED.—Ball, Flt. Sub-Lt. R. N., R.N.

PREVIOUSLY REPORTED MISSING, NOW REPORTED PRISONER.—Austen, Flt. Sub-Lt. V. G., R.N.

Reported Sept. 18th.

ACCIDENTALLY KILLED.—Bishop, Flt. Sub-Lt. A. A., R.N.

PREVIOUSLY REPORTED MISSING, NOW PRESUMED TO HAVE BEEN KILLED.—Bridge, Flt. Sub-Lt. B. H., R.N.

PERSONAL NOTICES.

DEATHS.

BETTINGTON.—Sqdn. Comdr. Aylmer Fitzwarine Bettington, R.N.A.S., who was killed whilst flying on Sept. 12th, was the youngest son of Colonel and Mrs. Bettington of Johannesburg.

Sqdn. Comdr. Bettington's eldest brother, Claude, an officer of the Royal Artillery, was killed in 1912 in an accident at Oxford, with Lt. Hotchkiss, R.F.C. His elder brother, Lt.-Col. Vere Bettington, is in command of an R.F.C. Wing. To his family all will offer the deepest sympathy.

One who knew Sqdn. Comdr. Bettington well, writes :—

"Whom the gods love die young.' And assuredly the gods loved Aylmer Bettington. And he died young. Here was the perfect embodiment of all that is summed up in the one glorious word, 'Youth.' Beneath his splendid frame beat the greatest of hearts. No endeavour was too high for him, no risk too great, no duty or sport not worth doing, and not worth doing well.

"To see him leading a Rugger pack with the same priceless skill, dash and pluck with which he handled an aeroplane, to hear his laugh in the mess or on the tennis court, to see with what enthusiasm he did his job, was to learn the true meaning of Love of Life.

"He has gone too soon. Young men such as he, with their high hearts, and simple, joyous, direct natures can ill be spared by the nation in times like these. And we who but yesterday had worked, played and jested with him have now but the loving memory of him. We, too, are poorer by his loss, but we are richer for having known him. Dear old Bett. May he rest in peace!"

BISHOP.—Flt. Sub-Lieut. Arthur A. Bishop, R.N., was killed on Sept. 14th, his machine nose-diving from a great height and crashing on the rocks off the Kent Coast.

DAWSON.—At an inquest held at Middlesbrough on Sept. 11th on the body of Prob. Flt. Officer John Marshall Dawson, R.N., whose death was announced last week, a verdict of accidental death was returned. He had had three hours' flying on dual control machines, and was then flying alone. In the fatal flight the machine nose-dived and then turned onto its back. The pressure on the wings caused them to break, and the machine fell in a mass to the ground.

POOFCESO.—A verdict of death from misadventure was returned at an inquest on Sept. 12th on Prob. Flt. Officer Alles Sangty Poofceso, R.N., whose machine fell into Chingford Reservoir. He was drowned before assistance arrived.

REEVES.—Flt. Lieut. Fabian Pember Reeves, R.N., who was reported missing on June 6th last, is now officially reported killed on that date. He was the only son of Mr. William Pember Reeves and Mrs. Reeves, of 43, Cornwall Gardens, S.W., and grandson of Mr. William Reeves, of Christchurch, New Zealand.

A semi-official account of the sinking of sundry German submarines, published on Sept. 15th, contained the following :—

A seaplane attacked an enemy submarine, which she had observed apparently manœuvring into position to fire a torpedo at a passing merchant ship. Before the seaplane arrived over the submarine the latter submerged, but three bombs were dropped on the position where he had disappeared from sight. In five minutes' time a large upheaval was noticed where the bombs had been dropped; this could best be compared to a huge bubble, rising some distance above the level of the sea, and distinctly visible for a minute or more. There was no further sign of the submarine.

MILITARY.

G.H.Q. COMMUNIQUÉS.

SEPT. 11th, 9.15 p.m.—On the 10th inst clouds and thick haze again prevailed and made (? air) work difficult. In spite of this observation was carried out for our artillery both by our aeroplanes and our balloons.

During the day our machines bombed two enemy aerodromes near Cambrai and rest billets near Douai, and during the night of the 10th-11th inst. dropped bombs on an aerodrome and searchlights near Courtrai.

In air fighting yesterday three German aeroplanes were brought down and seven others were driven down out of control. Of these two were brought down and one driven down by one pilot.

In one case this pilot descended to within 50 ft. of the ground and set fire to the machine he had brought down. He then regained our side of the line still flying at 50 ft., although attacked by three hostile machines.

Three of our machines are missing.

SEPT. 12th, 9.10 p.m.—After midday on the 11th inst. the bad visibility of the morning improved and aerial activity became great. Very successful artillery and photographic work was carried on continuously.

During the day 281 bombs were dropped on various targets, including two aerodromes south of Lille and two aerodromes and a large ammunition dump in the vicinity of Roulers. During the night 89 bombs were dropped on railway stations, ammunition dumps, and trains in the Courtrai area, making a total weight of over six tons during the 24 hours.

Fighting was very vigorous and strong formations of enemy scouts were encountered by our patrols. Artillery and photographic machines working well over the enemy's country were also frequently engaged.

Seven hostile machines were brought down in combat and 12 were driven down out of control; in addition one German machine was shot down by our anti-aircraft guns.

Eight of our aeroplanes are missing.

SEPT. 13th, 9.15 p.m.—In spite of bad visibility some artillery work was carried out by our aeroplanes yesterday, and photographs were taken.

Bombing of the enemy's aerodromes, ammunition dumps, and railway stations was continued by day and night.

Three enemy machines were driven down out of control.

AERONAUTICAL ENGINEERING
SUPPLEMENT TO "THE AEROPLANE"
INCORPORATING AIRCRAFT ENGINEERING, AERODYNAMICS, AND MATTERS PERTAINING TO THE AERONAUTICAL ENGINEER AND THE AIRCRAFT TRADER

The Production of Aeroplanes and their Components

(Thirteenth Instalment.)

BY STEPNEY BLAKENEY.

Elevators.

The elevators which are attached to the tail plane should now put in hand. As they are of similar construction, the only fference being the shape and size, it will be unnecessary to scribe their construction in detail. This also applies to the dder and fin.

Control Levers.

The levers on the elevators and rudder we will assume, firstly, e made of mild steel stampings. That being the case, they ust be sent into the metal machine shop to be bored out to onto the steel tubing. This can be done by either "chucking" em in a chuck in a lathe, or fixing in a drilling jig and drilling in. below size and finishing with the correct sized reamer.

These levers, however, may be made of hollow sheet steel, in hich case they will be edge-welded, with stiffening pieces at e ends for attaching the "D" shackles attached to the control ables. And a steel boss will be riveted to the centre for attaching em to the steel tube, to be drilled and pinned thereon.

In this case a considerable amount of work is in hand, and a rtain amount of experimental work is necessary. The drawings ould be carefully studied. Assuming these levers to be of reamline section, the first thing to do will be to get the pat-rn-maker to make a wooden pattern for a former, on which will be bent and formed one-half of the lever, which we can assume be made out of 20-gauge sheet steel. The former should be ade, both male and female, so that the sheet steel can be aned out and afterwards finished to shape by pressing, or queezing, against the cast-iron former.

After the sheets have been made correctly to shape, they can en have the hollow bosses attached to them by means of rivets nd brazing, the whole being assembled for this purpose on a andril.

The hollow bosses are of about 14-gauge sheet steel, and are enerally "spinnings." These being an extremely difficult thing make, it is best to obtain them from certain firms who make speciality of this class of work, as they would be too costly to ake, not to say unsatisfactory, except in e hands of skilled metal spinners equipped ith the necessary tools.

Fixing the Levers.

The levers which have just been described e required for the rudder and the elevators. hey are attached to the steel tube framing the rudder and elevators by means of per pins, which are carefully put through e bosses of the levers and the steel tube nd riveted over. After this, the whole carefully sweated together with solder. his solder must be the best tinman's older, for it forms the strongest joint, nd flows more evenly and neatly than umber's solder into the small crevices and penings. Any superfluous solder should be eaned off with a rag or small scraper or ne file while still hot.

Tail-skid Fittings.

The various component parts of the ar skid will next have to be con-dered, and we can here deal with the ost important of them.

The skid-fork will probably be a mild steel stamping. This requires to be machined up with considerable accuracy and precision to fine limits. To proceed with the work, it will be best to have the socket-end turned down in a centre lathe, as it will serve as a gripping piece for the jig, which will have to be made to hold the skid-fork whilst it is going through the operation of being milled.

For this purpose it must be sent to the marker-off and be centred. It can then be sent to the metal machine shop, where it will be placed between the centres of a small lathe, say a 6 in. centre engine lathe. Here the outside will be turned down to the dimensions shown on the drawing.

Milling Operations.

After this, the stamping will be sent to the milling machine to have the fork-ends milled. For the purpose of holding the stamping, a heavy cast-iron jig had better be made, or a mild steel clamping jig (see Fig. 18), which holds the socket-end firmly, whilst the fork-ends project upwards. Possibly it may be advantageous to mill about three fork-ends at once, and the jig can be made accordingly if desired.

The next thing to do is to set up the milling cutters on the spindle of the milling machine. These will be "side and face" cutters, which means that they are capable of cutting on the flat face at the side as well as on the circumference.

They can be set up so that they mill the outside faces of the fork, and so there will, of course, be a fixed overall dimension. The distance apart of the cutters must be maintained by collars placed between the cutters on the spindle, and well tightened up to prevent the cutters from slipping when the machine commences to cut.

These two cutters will clean up the faces of the forks, after which the cutters can be replaced with another couple of cutters to finish the inside of the fork. Or, if the stock of milling cutters happens to be extensive, possibly one of the right width can be found which will guarantee the accuracy of the width of the cut.

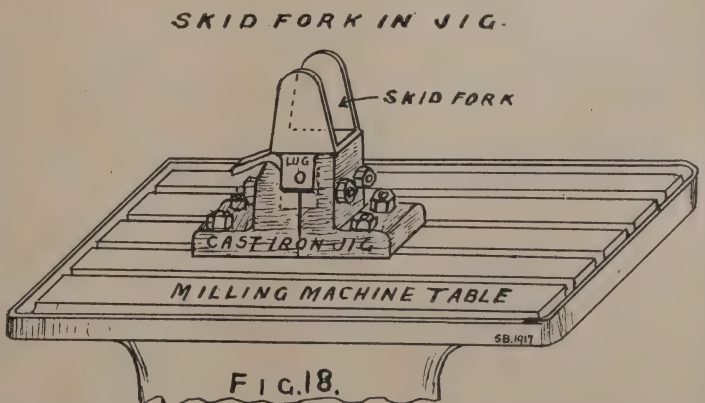

FIG. 18.

Edge Finishing.

The next thing will be to finish the edges of the fork. These can be done in the vice, with a file, by the fitters, but, of course, the whole of the work can be done on the milling machine, if the stock of milling cutters is sufficiently extensive. In this case another jig must be available for supporting and gripping the fork-ends whilst the edges are being milled and the top of the forks rounded to the true curvation. Naturally, this method is preferable, as accuracy is guaranteed, but this could only be done in a shop with a fair-sized machine-tool plant, unless time was no object.

Drilling the Fork-ends.

The operation of milling having been completed, a drilling jig must be made for drilling the holes in the fork-ends for the skid-bolt to pass through.

Boring the Socket.

Having completed these operations, the next thing to do will be to prepare a cast-iron boring jig which will grip the socket end of the fork whilst it is being bored out. This jig can be made either to bolt onto the face-plate of the lathe or to be stood on the table of a large drilling machine, whichever is available for this work, so that in the case of a small machine shop, no undue inconvenience may be caused (see Fig. 19).

The boring-out having been completed, the skid-fork may now be considered ready to be sent to the inspection department. They should easily pass through here, as most of the operations are machine work, and, with the male and female gauges to check dimensions, accuracy should be assured.

Skid-stay Forks.

The next items are the forks for skid-stay, or stay-tube sockets, as some people call them. These articles, though simple to look at, are not exactly easy to make, and may cause a considerable amount of trouble and scrap if not manufactured in the right way.

For this purpose they will be made out of solid steel bar, turned out to profile on a capstan or turret lathe. This operation consists of turning down the socket-end to the taper shown on the design, and boring the fork-end to the profile, the socket leaving the lathe with the fork-end solid. This will have to be cut out on a milling machine, and here the trouble commences unless a good jig is made which will hold the socket-end firmly whilst the fork is being milled out.

The jig for this purpose should consist of a mechanism which will grip the taper of the socket firmly. For this purpose make a strong grip-jig, something on the lines of a machine vice, or similar to Fig. 18, only with special jaws. This will enable about three or four sockets to be done at once, all being placed in the jig in a line. In this way fairly quick production becomes possible immediately. The drilling of the A.G.S. pin-hole in the fork-end will necessitate a drilling jig, which can be built up of mild steel, or cast-iron, whichever is most readily obtained.

The Skid Fitting.

The steel-clip fitting for attaching the stay tube to the fuselage is made of two pieces of 16-gauge sheet steel, each bent to fit the longeron and also to form the lug to which is attached the stay tube. The edges of the two pieces forming the lug are brazed together, with the addition of a small washer on either side, the hole afterwards being reamered out. The object of the washers is to increase the bearing area for the attachment bolt which passes through. On the inside face of the fitting is a steel socket, into which the cross tube is fitted. This socket is welded on, and into this is fitted the cross tube which forms the support for the bearing for the skid post.

Strut-end Fittings.

It will be noticed that at the end of interplane struts, which in many types of machines are made of spruce, a steel fitting in the form of a streamline band or ferrule passes round the strut end. Into this is fitted an aluminium packing piece, which fits onto and forms the connection between the eyebolts, which pass through each spar, front and rear. This packing piece, with the band, keeps the struts into position and takes the thrust.

This streamline band is formed of about 20-gauge sheet steel in one piece, the two edges at the rear or thin end of the streamline being butted together and welded. This welding must be well done and neat, as no filing nor cleaning up of welded joints is permissible. Afterwards it must be well annealed.

Making Strut Sockets.

The best way of making these strut sockets is to have a cast-iron former cast, the pattern being equal in length to about 9 inches of the spruce strut at each end. This being cast, it must be carefully cleaned up, and then it is ready for the sheet steel blank, which is to form the strut socket, to be bent onto it and round it.

Before cutting up sheet steel, it is as well to get a piece of zinc, or thin common black iron, or tin, and bend it round and cut it until the required shape and pattern is obtained, after which it can be flattened out and used as a template for marking off the actual blanks. It may be as well to point out, however, that the outer extremities of the socket should be left quite full, and more or less shapeless, as in actual practice it is found to be safer to finish off the final shaping after the welding is complete, in case of any twist or deformation having occurred during welding, as is not infrequent. Also, the ends require to be trimmed with a file to suit the aluminium packing pieces.

This being done, the bolt and pin-holes will be carefully set out and marked off ready for drilling, and drilled. After which the fittings can be considered finished and can be sent to the inspection department. When finished with here, it will be sent to the wood-components department to be fitted to the struts.

Packing Pieces.

The aluminium packing pieces which fit into the strut sockets are generally made off metal patterns, and the castings usually obtained are nearly perfect. Thus they require very little cleaning up. The only machining to be done consists in drilling the bolt-hole and milling out the radius slot where the eye-bolt fits into the packing piece.

This work is usually done in a small milling machine with a milling cutter of the required diameter.

In assembling the strut ferrules and packing pieces onto the strut ends, care must be taken to see, and make sure, that the aluminium packing piece beds onto the spruce strut. Unless it does so, it is possible that the strut may not do its work, and might be the cause of a failure of the whole machine.

Small Clips.

It frequently happens in a large contract that amongst the many items called for are small clips. These clips may be pipe clips or wire clips. Sometimes the clip is semi-circular, sometimes square, in fact, they are all shapes and sizes, but each clip of any certain type or size must naturally be strictly to dimensions and limits. The gauge of the metal used in their manufacture is often very thin. When this is the case it frequently happens that it is possible for this work to be done by girls.

To enable girls to manufacture these clips, and save the expense of making costly press tools which take a considerable time to make and also to save using presses on work they need not be employed on, it is best to make a few simple jigs which can be used in the bench vice, and the power obtained from the use of an ordinary hammer, or the squeezing action of the vice.

Clip Jigs.

Assuming that we require a thousand clips to clip §-in. copper petrol pipes, the best thing to do is to get two pieces of steel, exactly equal in thickness to the required width of the clips, each we can say for our purpose about 3 in. long by an inch wide. File them flat and square all ways, then on one mark out your

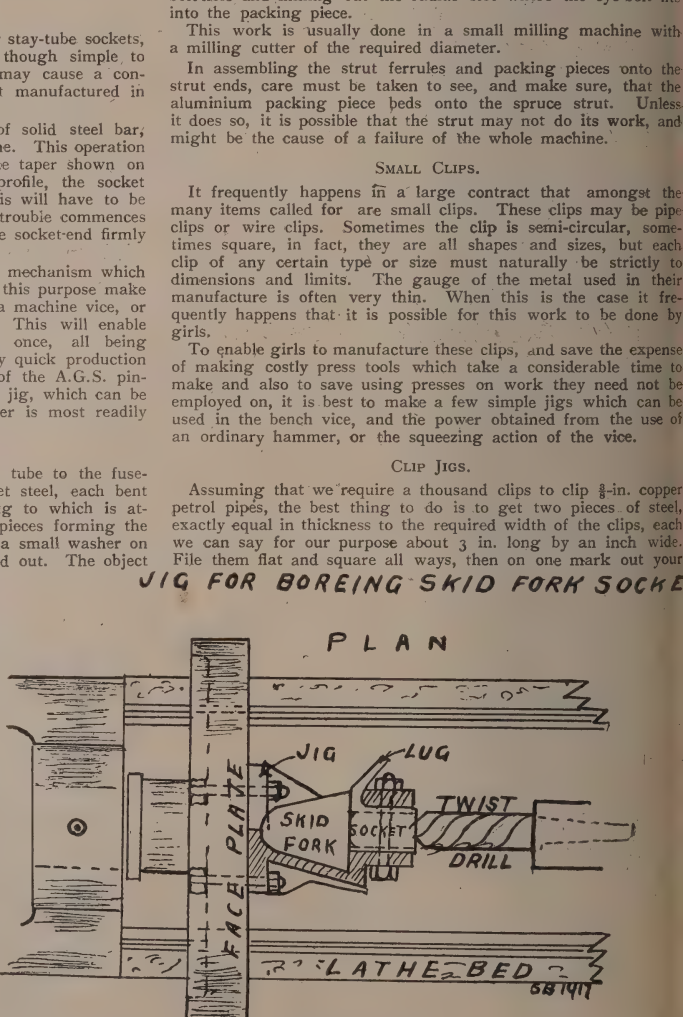

FIG. 19

SUNBEAM-COATALEN AIRCRAFT MOTORS

CONTRACTORS TO H.M. ADMIRALTY, RUSSIAN & FRENCH GOVERNMENTS

The SUNBEAM MOTOR CAR CO. Ltd.
Head Office and Works - - - WOLVERHAMPTON

clip, and file this up to form a female gauge of the pipe clip, only leaving it the same thickness as the required width of the clip. After this file up the other piece to form a male gauge corresponding to the other piece forming the female gauge.

When these are complete, put them both together and mark off half the thickness of the gauge of metal on each one, file this off, and you have a male and female gauge to suit each side of the desired clips. These then form the die and the punch for making the clips.

The next thing to be done will be to fit a couple of pins into the ends of each end of the male portion, and then drill holes in a corresponding position in the female portion for them to slip into. This being complete, all that remains to be done is to cut off strips of the metal to be used, a shade wider than required, and cut off into suitable lengths, equal to the total length of the clip when flattened, plus a small amount, which must be the same in every case.

Clip Production.

Having got so far, it may be possible to start production.

The first thing to do will be firmly to grip the female portion of the jig in the vice, with the clip side uppermost, then drop the other half of the jig onto it, lift slightly, and slide a piece of metal between the two and accurately locate it in the middle, a few taps of the hammer and the clip will be found to be practically shaped up. The next thing to be done is to drill the holes in the clip for the attachment screws.

The same jig can be made to act as a drilling jig. For this purpose drill the two holes through the jig in the required position. These holes will, of course, pass through the first clip, and all others can be drilled the same way, after which the surplus metal may be filed off and the clip will be complete.

This method is a simple but effective way of producing small clips quickly and accurately, and can, of course, be elaborated if desired. Also the jigs being simple of construction, two or three can be made quickly, or any jig worn out can be replaced. Also it enables girl labour to be utilised, providing the gauge of the metal used is not thicker than 18 gauge.

Engine Plates.

The production of the front and back engine plates by hand is a job that should only be put into the hands of an experienced sheet-metal worker, as the gauge of these being about 10-gauge which equals 0.128 of an inch makes it a fairly tough job. However, it can be done, and is done, but it is not like shelling peas.

The back engine plate, we will assume, is of rectangular shape, the edges and lightening holes all being flanged at right angles to stiffen the plate. Therefore, in marking off the plate on the sheet, all necessary allowances must be made for the flange and bends. This can be easily done first before actually cutting out the engine plate, in the following manner.

We can assume that the edge of the plate, which forms the top and bottom flange, when in position, is about ½-in. wide, with 3/16-in. radius. Therefore, take a piece of steel plate, 10-gauge in thickness, say 5 in. long by 3 in. wide, and mark off a ½-in. flange either end, and then put it in the vice with a piece of bar steel having a 3/16-in. radius, and hammer the steel plate with a mallet over this flanging jig.

When this has been done at both ends and a ½-in. flange accurately formed, having a 3/16-in. radius, take the piece of steel out of the vice and measure it over all, and find out if it measures 4 in. across the two flanges, or if it is more or less, and accordingly make your necessary calculations and allowances. Doing this will enable you to cut out the plate to the dimensions required, to give you enough material to work with, to enable you to produce the engine plate to the precise required dimensions.

In cutting out and flanging the lightening holes had better be started and finished first, as any buckle or distortion can be eliminated in the plate before the important hole for the engine attachment is cut out.

Before commencing to work on the plate it is as well to anneal it thoroughly, according to the instructions laid down for annealing steel plates, after which the lightening holes should be carefully set out. Take care to leave enough metal for flanging, plus a margin for cleaning up, after flanging.

All flanging should as far as possible be done with hard wood mallets, to prevent the metal from being thinned down and the surface damaged.

(To be continued.)

GERMAN AEROPLANE PRODUCTION.—A photograph of the wing assembling work in the Albatros Factory. Fabric strips are being strung onto the ribs to make a lining between the rib and the doped fabric on top. It may be noticed that the workers do not show any noticeable signs of starvation, despite the stories of which we hear so much.

KINDLY MENTION "THE AEROPLANE" WHEN CORRESPONDING WITH ADVERTISERS.

AEROPLANE PRODUCTION CRITICISM.

The following letter has been received:—

Sir,—As an interested reader of Mr. Stepney Blakeney's article, "The Production of Aeroplanes and their Components," and as one concerned with the production of them in quantities, may I be permitted to remark upon the paragraph appearing under the heading "Wiring Plates," August 15th, ninth instalment?

The author there states: "make templets," "mark out sheet to same," "cut out on jig saw," "and file to shape." "By this means a large number of components can be quickly put through the works." In the writer's experience, drilling holes around the marked-out part is far more rapid than the jig-saw method of cutting out.

Hand production of parts seems, however, only practical when making one or two experimental machines, and if handling a contract for several hundred machines, with the Air Board constantly pressing for delivery, more rapid methods of manufacture must be considered.

The writer would put forward the following practice, bearing in mind the cry "more aeroplanes—quickly":—

Taking the case of a concern three parts through a contract, and preparing to take up the manufacture of a new type of machine, the tool designer, if smart, will standardise press tools and drilling jigs in a range of sizes.

The tool-room, at this time rather short of work, will machine and fit these in readiness for the time when the drawings come to hand. A good stock of drill bushes will also be made in all sizes.

In the case of blanking tools, the dies will be made in two sections, fitted to a bolster with all screws and dowels. As soon as the drawings are available the tool-room will get to work on templets of all plate-work parts. These will be sent direct to the A.I.D. for acceptance.

These proving satisfactory, will be used to lay out press tools, and also to gauge same in manufacture. A suitable size of die being selected from stock, it is marked out to templet, removed from the bolster, and being in two sections, divided along the centre-line of the job, can be almost finished on the milling machine with a minimum of hand work.

By the time the shops are ready for them, nearly all the blankings will have been made.

The drill jigs can be started on as soon as blankings are available. A blanking would be located with gauge plates cut by its own press tool, while it is not a long job to bore for bushes, these being taken from stock.

All plate-work parts would be drilled flat and well annealed before bending on former blocks under the press.

These standard tools being quickly disposed of, the tool-room would turn its attention to special jigs and fixtures.

The writer's experience is that a large and well-equipped tool-room pays.

(Signed) C. J. Francis.

Mr. Blakeney's Reply.

Sir,—In reply to the comments of Mr. C. J. Francis of my article in your issue of August 15th, I note that he is in favour of drilling holes around any sheet metal part he is making for the purpose of detaching the metal part in the rough from the large plate, his reason being that it is more rapid. I beg to say that I tried this method some considerable time ago, and gave it up, as being thoroughly unsatisfactory.

My reasons were that in addition to having to mark off the plate in its outline, you again had to mark off the holes for drilling, unless you cared to risk the drill cutting into the scriber line, or being too far away. Also after the drilling is completed, it is necessary to cut out the metal part required from the sheet, either with a hack-saw or a small chisel, and after this has been done the sheet metal worker is confronted with a thoroughly rough ragged-edged piece of metal to file up, with a far larger bulk or mass of metal to remove than would be the case if cut out by an experienced jig-saw operator. Such operators are in most cases fully capable of sawing a piece of metal out, almost dead onto a scriber line. Also the excessive wear and tear of the teeth of a file on these ragged edges is enormous, thus further adding to the cost of production.

I quite agree, that the making by hand of sheet metal parts is slow, and if I were carrying out a contract for several hundred machines, as mentioned by Mr. Francis, I should most certainly do them under a power press, and have done so with contracts for less quantities. I must, however, ask Mr. Frances to refer back to my article in the 8th August issue, wherein I most specifically mention that "as we have only a small order, etc., etc., it will be useless to consider making dies and punches, etc."

With regard to the remarks and suggestions of Mr. Francis, that "the tool designer, if smart, will standardise press tools and drilling jigs, etc." May I ask him how he proposes to standardise the press tools, etc., for work for which he has not yet, as he states himself, received the drawings? It seems to me that such a procedure would be likely to cause his firm considerable, not to say unnecessary, expense.

With regard to blanking dies, these frequently take nearly a fortnight to make before they can be used for any production, and by that time the erecting shop would be waiting for the metal parts, which could have been put in hand in a small quantity during the time occupied in waiting for the press tools. Thus hand-work would expedite delivery and erection instead of the works producing nothing for a fortnight.

I quite agree that a large and well-equipped tool room does pay, but there are very many firms who have not got one and could not afford one, and if they could, probably could not get the equipment.

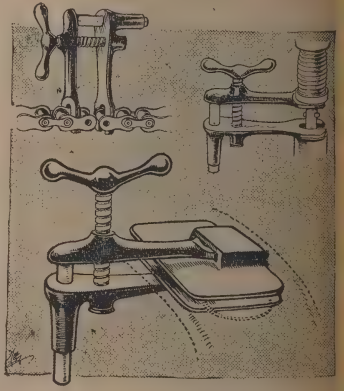
I would also like to point out that these articles are not dealing with very large engineering concerns, but small ones, employing moderate capital and a small number of hands.

I was pleased to receive Mr. Francis's comments, and hope you will find space to publish same.—S. B.

[Criticisms of Mr. Blakeney's articles are always welcome, but those who feel disposed to criticise are asked to remember that these articles are only intended for the education of the young and of new-comers to the Aircraft Industry. They are, therefore, of a purely elementary character and only profess to give a general idea of how a fairly modern aeroplane of conventional design is built. Anything calculated to be highly instructive to managers or foremen of first-class aircraft factories would naturally be of at least equal value to the enemy, and it would therefore be contrary to the interests of this country to publish such descriptions.—Ed.]

IGNITION CABLES.

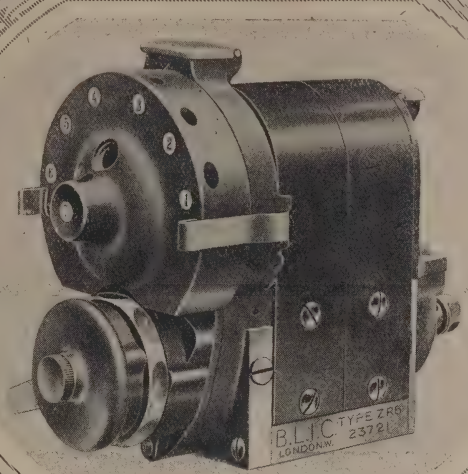
A very considerable part of the business conducted by Messrs. E. Kalker and Co., of Coventry—who have made a speciality of all types of cables and flexibles for the motor trade generally since the first cars were made in this country—is centred in the special cables they supply for aero-engines made to the specifications of the Aeronautical Inspection Department.



These cables, particularly their IIIA Special Magneto Cable, are of such a uniform high quality that not an inch has ever been rejected by the Government inspectors out of the many hundreds of miles supplied by Kalker and Co. for this class of work. The same remark applies to the ignition cables supplied to the Government for the Tanks and W.O. lorries.

The firm has a high reputation for armoured lighting cables in single, twin or triple core, brass and aluminium strip armoured, and they are also specialists in making up cables for electric starters of motor-cars, armoured or braided.

OF USE TO MOTORISTS.



Brown Bros., Ltd., of Great Eastern Street, are well known to the aircraft industry as suppliers and manufacturers of many aircraft components and accessories. They have a still greater clientele among the motoring classes, and as practically everyone concerned with aviation is interested directly or indirectly with the care of some motor vehicle—from a two-stroke motor-cycle to a ten-ton lorry—one need not apologise for alluding to articles not directly connected with aircraft.

A speciality of Brown Bros.' motor department is the Duco Leaf-Spring Gaiter for totally enclosing motor-car springs, as a protection from dirt and water. The springs are thoroughly greased between their leaves, mopped all over with grease, and the gaiters are fitted. Thus the springs work under ideal conditions of lubrication, with a consequent increase in life, and an improved maintenance of comfort, a point of importance where motor ambulances are concerned. It need hardly be added that well-greased and efficient springs add life to the engine, transmission, and tyres of any car working under the stress of war conditions. A measurement form may be obtained upon application.

An ingenious accessory, which has also been placed upon the market by Brown Bros., is the combined valve spring-lifter, tyre patch holder, and chain pulley, illustrated.

The sketches explain themselves, and one need only add that the device is a distinct asset in a tool kit, as it performs three functions, which one cannot always achieve with unsuitable instruments. The device is sold in motor-cycle and car sizes.

British—and Best!

B·L·I·C

THE BRITISH LIGHTING & IGNITION Co. LTD.

Built in a British Factory by British workmen, with a unique experience of magneto manufacture, the "B.L.I.C." embodies every scientific principle in design and manufacture. It is the most reliable magneto yet produced—British or foreign.

At present our works are entirely engaged in meeting the requirements of the British and Allied Governments. We trust, however, you will specify the "B.L.I.C." Magneto for your post-war requirements.

The BRITISH LIGHTING & IGNITION Co., Ltd.
(Proprietors: VICKERS, LIMITED),
204, TOTTENHAM COURT ROAD, LONDON, W.1.

MARKET REPORTS.

Prices given are for quantities on usual terms.

Sept. 13th, 1917.

COPPER.—There is naturally very little interest shown in the market here. The official prices continue unchanged and supplies are satisfactory. It is rumoured that the U.S.A. War Industries Board have agreed that 22½ cents per lb. will be the price advanced to producers. If this is correct, it should create satisfaction among producers. However, nothing official has been issued, and in the meantime buyers are being forced into the market owing to the depletion of their stocks.

Current Prices.

Copper Ingot, Standard	£120 per ton, Cash
Copper Sheet	£160 per ton.
Copper Tube, S.D.	19¾d. per lb.
Brass Sheet, 24 Gauge	15⅞d. per lb.
Brass Tubes, S.D.	16½d. per lb

TIN.—The Tin market still shows signs of an unsettled condition, and in consequence prices continue to fluctuate. It is, in fact, very difficult to foresee what will happen, although it is not expected that there will be any further appreciable decline in the price.

The output of Tin is fairly satisfactory, and supplies are being maintained.

Comparative Prices.

To-day	
Sept. 10th	£241 0 0
Sept. 6th	240 15 0
Sept. 4th	241 15 0
August 10th	244 5 0
Highest Price, 1916	205 0 0

LEAD.—A detailed order, issued by the Ministry of Munitions, gives them complete control of the whole of the Lead supply of the United Kingdom.

The order is briefly detailed below, also the official prices, which continue unchanged.

Communications on the subject of remelted, old or scrap Lead, or Lead residues, should be addressed to the Director of Materials, A.M., 2/E.S., Hotel Victoria, Northumberland Avenue, W.C., marked "Scrap Lead." All applications for licences to purchase Lead or other than remelted, old or Lead residues, to the Director of Materials, A.M., 2/E., at the same address, marked "Lead Licence," and all applications to use Lead, other than remelted, old or scrap Lead, or Lead residues, to the Controller, Priority Department, Caxton Street, Westminster. It should be understood that the Order, dated April 6th, 1917, relating to certain classes of Lead, is cancelled, except for Clause 8, but this cancellation does not affect the previous operation of that Order nor the validity of any action taken thereunder.

THE ORDER.—The Ministry of Munitions takes possession as from September 1st of all Pig Lead, whether virgin or remelted. old and scrap Lead, and Lead residues, excepting such Lead as may be in the possession of or under an existing lawful contract, in writing, for future delivery to a manufacturer for use in the manufacturer's own works, and Lead as may be specially excepted under written authority.

The Lead of which possession is taken will be paid for on delivery; as to virgin Pig Lead, at the prices specified hereunder; and as to remelted, old and scrap Lead, and Lead residues, upon terms which will be communicated in due course to the various owners.

All existing licences for dealing in any Lead are cancelled, and no persons shall, as from September 1st, purchase, sell, offer to purchase or sell, or, except for the purpose of carrying out a contract in writing existing prior to April 6th, 1917; for the sale or purchase of White Lead, Lead oxides, Lead manufactures, Lead alloys, or Lead compounds, of any kind, or a contract in writing existing prior to February 2nd, 1917; for the sale or purchase of any kind of Lead, enter into any transaction or negotiation, in relation to the sale, or purchase of Lead situated outside the United Kingdom, except under and in accordance with the terms of a licence issued under the authority of the Ministry of Munitions. Further, no person shall offer to purchase or take delivery of any Lead situated in the United Kingdom, except under and in accordance with the terms of a licence issued under the authority of the Ministry of Munitions, or offer to sell, sell, supply, or deliver any such Lead to any person other than the holder of such a licence.

No purchase or sale of Lead situated in the United Kingdom shall be at a price exceeding that given below, and no person must use Lead for the purpose of any manufacture or work, except for the purpose of a contract for the time being in existence, or order certified to be within Class "A," or certificate by or on behalf of the Ministry of Munitions to be within Class "B," or for the purpose of necessary repairs or renewals where the use is not exceeding one cwt. of Sheet Lead or Lead Pipe, and not exceeding 28 lbs. of Solder and no other Lead is involved, or for the purpose of Pipe Casting from Metal already in the form of Pipe on February 2nd, 1917, or from Lead purchased for that purpose prior to that date, or under licence.

Return of Stocks are to be made monthly, giving stocks, purchases, lead delivered, etc., but where stocks, etc., do not exceed one cwt., no returns are necessary.

Official Prices.

Virgin Pig Lead	£29 per ton, c.i.f.
Virgin Pig Lead	£30 per ton. Ex Stores

Manufactured Lead.

Sheet Lead	£39 10s. per ton, delvd. U.K.
Lead Pipe	£40 per ton, delvd. U.K., less 2½ per cent., M/A.

Lead Compounds.

Dry White Lead, £46 per ton, delvd. U.K., less 5 per cent., M/A.

White Lead in Oil, £53 per ton, less 5 per cent. for over 5 cwt. lots.

White Lead in Oil, £55 per ton, less 5 per cent. for under 5 cwt. lots.

Red Lead £42 per ton, less 2½ per cent., M/A.

The White Lead prices are subject to revision, should the price of Linseed Oil fluctuate above or below the average spot price of £50 per ton.

STEEL.—In certain quarters there is a feeling that the output of Aircraft Steels is all that is required; although tremendous efforts have and are being made to effect an enormous increase in the output of the various Steels, one is inclined to think that it will be a few months yet before the output will overtake the present and ever growing demand. The chief concern at present is Cast Steel. This has been brought about by the Swedish crisis. It has, of course, been generally known that we were not receiving a fair proportion of the available supplies of Swedish Ore, and the present crisis is being keenly watched by Cast Steel makers. The situation is very serious indeed, and the Cast Steel problem is likely to give the authorities very grave concern. Prices continue unchanged, although the Director of Steel Supplies has not yet notified constructors of the prices they will be charged for material supplied to them by the Air Board.

R.A.F. 3B Steel (Black or Blue Reeled)	78s. to 80s.
R.A.F. 1E Steel ,, ,,	36s. to 40s.
R.A.F. 9A Sheet Steel, 30s. to 32s. per cwt.	

ALUMINIUM.—Supplies of this material are quite satisfactory, and the official prices remain unchanged.

Ingot	£225
Remelted	210

TIMBER.—The Timber situation is still very acute, and unfortunately there are no signs of a satisfactory solution. One hears that experiments are being made with woods with the object of finding a substitute for Silver Spruce, but nothing satisfactory appears to have been discovered. Prices continue to soar to an abnormal height, and, as a matter of fact, it is impossible to obtain supplies of Silver Spruce at any price. Small supplies of Walnut and Mahogany continue to leak through, but firms who have a demand for Softwoods are experiencing great difficulty in procuring the timber.

Current Average Prices.

Silver Spruce,	17s. 9d., c.f.
English Ash,	13s. 6d. to 15s., c.f.
Walnut,	2s. 3d. to 2s. 6d., s.f.
Mahogany,	2s. 2d. to 2s. 4d., s.f.

Prices include selection and delivery.

FABRIC.—The news of labour troubles in Ireland is very grave indeed, and it would not be surprising to learn that it was a result of "Hunnish intrigue." In any case it must be settled soon, otherwise constructors will be very seriously handicapped.

The official prices continue unchanged.

Official Prices.

R.A.F., 17C Cloth, 2s. 8d. per yard, 36 in. wide.
R.A.F., 17C Cloth, 2s. 9½d. per yard, 38 in. wide.

PRAISE FROM A HANDBOOK.

In a recent practical manual on autogenous welding, the authors deal fully with the immense varieties of metal repairs that can be effected by scientific welding as practised by Barimar, Ltd., 10, Poland Street, Oxford Street, London, W. They point out that the process is not in use in some foundries which, it would appear, still cling to antiquated methods such as the "burning on" process for treating fractured castings. The authors rightly emphasise that, with a scientific weld, the part treated can be considered as good as new, since the metal added is at least as good in quality as the original article. Those foundries who from conscientious motives hesitate to employ scientific welding have only to reproach themselves because, as the authors truly remark, "even badly applied autogenous welding is a process a hundred times preferable to the obsolete methods still in use in certain foundries."

ON THE VALUE AND USE OF THE LARGE AEROPLANE.

The following article, reprinted from "Aviation," New York, ust 15th, is ascribed by that paper to Mr. F. Handley Page. Page, it seems, did not write the article himself, but it ably includes his views, translated by one or other of his y friends in America. In any case, the article is worth ishing on its merits. Apart from that, it seems unlikely that figures published are accurate, for even an American journalist, wing that his paper would ultimately reach Germany, via land or Scandinavia, would scarcely publish correct and ern figures for machines of real value.—Ed.]

he endeavour of the present article is to show how by the use rge aeroplanes Amercia can make her weight felt in this war much greater extent than by equipment of any other sort.

is a well-known fact that the large aeroplane is an abso- necessity whenever great distances have to be travelled or e weights be carried. The high speed type of machine, n its very small margin of weight available for carrying ful loads, is of little value except for short distance fight- and high speed performance.

When great loads are to be carried or long distances be n, one must resort to a somewhat slower machine, flying bout 100 miles per hour (instead of the 130 and more miles hour which the speed scouts attain) and capable of carrying b. per horse-power, compared with the 7 or 8 lb. of the high d machine.

To fully understand the diverse problems which confront employment of the military aeroplane it is necessary to mine the conditions prevailing at present on the Western nt. There great armies, immobilised by trench warfare, separated from one another by very short distances, so n an hour or two's flight at the outside will display to the osing side the whole of the enemy's defence works, depots, mmunication lines, and so forth. The carrying out of this nnaissance work obviously entails considerable risk to the nnoitring machine, and for the purpose of its protection s essential that fighters of one type or another should accom- y it. In addition to this, the fighters go into action to keep y from the friendly lines enemy fighting and reconnaissance chines.

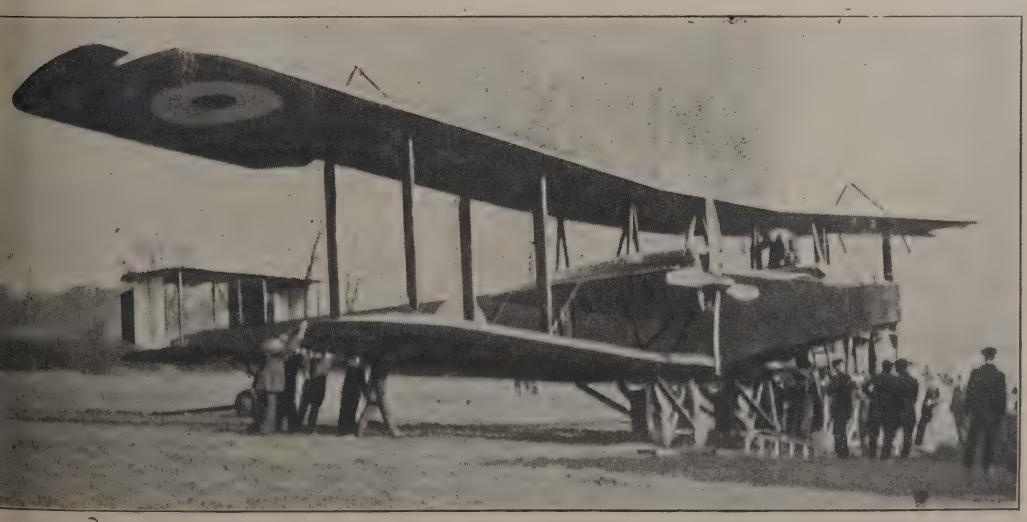
t is particularly worth attention that all these machines rate over relatively short distances only. The fighters, in ticular, carry only light loads, so that their requirements easily and amply met by the employment of small high speed its, which, owing to their great manœuvring ability, are able fight at close quarters, and thus overcome the handicap of urate gun fire, which is a conspicuous feature of present-day al gunnery.

uch are then the requirements that must be met by an aerial ce working in conjunction with an army engaged in trench fare. In view of the very rapid development of the aero- ne, it is, however, quite possible that the whole present sys- of warfare may undergo, in the near future, extensive rations. The advent of the large, multi-engined aeroplane ears in particular to forecast such a change; it seems, there- fore, worth our while to examine in what way and to what extent the large aeroplane differs from the older small type of single-engined machine.

The first quality we notice is its ability to fly considerable distances with heavy loads, and whereas its large size affords more comfort to the crew, long distances may be covered without great strain upon the occupants.

There is, however, a further quality which any multi-engine machine possesses, namely, that of alighting when and where it chooses, thus minimising the risk of a forced landing due to engine failure. If we could at the present time remove from the aeroplane's characteristics the feeling of uncertainty, we should at once advance its utility to a great extent. The multi-engine machine appears to well fulfil this requirement, for it is the engine that provides, more than anything else, at the present time, that element of uncertainty which makes a more extended use of the aeroplane problematical.

Since we are unable to build our engines very heavy, as in the case of locomotives and steamships, and so increase their reliability, we can but resort to a system of multi-engines to provide against breakdowns and so prevent the machine from landing on unsuitable ground.



The failure of one engine should not prevent the machine from flying home with the remainder of the power plant; to be sure, the speed would be reduced, but, on the other hand, with one engine cut out, more gasoline would become available, so that a correspondingly greater distance could be covered at reduced speed.

A further advantage may be found in the relative simplification of the landing chassis, whose present elaborate design is mainly made necessary by the eventuality of landing on unsuitable ground. A multi-engine machine being able to choose its landing ground, the cost of housing would also be greatly reduced, because, instead of providing for a great number of landing places situated at short distances from one another, as has recently been suggested for commercial aviation, it would be quite sufficient to establish aerodromes only at such points where reasons of expediency required.

These considerations are also likely to alter current ideas in regard to the use of the seaplane. Seaplanes, whether of the boat or float type, have performances inferior to aeroplanes of the same size and power chiefly owing to the much greater weight and resistance of the boat or float as compared with the chassis of the aeroplane. If, however, we can discount the eventuality of a forced landing, we can just as well do away with the boat and float and employ ordinary aeroplanes for naval service, since the system of multi-engines insures the machine against being forced to alight on the sea.

A discussion of the large aeroplane naturally leads one to consider how this type of machine could be made particularly suitable to the needs of the United States in the present war. This problem may be dealt with under two headings:

1. Co-operation with the Allies on the Western Front.
2. Submarine patrol work.

THE HANDLEY PAGE BIPLANE, as illustrated in "Aviation," New York.

The present requirements of the Western Front, as far as the co-operation of the aviation service with an entrenched army is concerned, have briefly been touched upon above. There opens, however, a far greater and wider sphere for the aeroplane if one proceeds to consider a real aerial offensive. While it is true that a number of bombing raids have been conducted in the past, these expeditions never extended over great distances, and the load of bombs that has been dropped on the enemy's interior lines has, relatively speaking, been a limited one.

With the use of large squadrons of multi-engine aeroplanes this situation would be materially altered. If one imagines a fleet of several hundred of such machines, each carrying one, two, or even three tons of bombs, penetrating after a flight of many hundred miles into the very heart of the enemy country and destroying with high explosives the manufactories which are essential to the provisioning of the people and the munitioning of the armies, it will be evident that we should be able to strike a blow at the very backbone of the enemy's armies.

No gun can, at the present time, fire the distance, or deliver so much explosive at a given spot as the aeroplane, and but few guns are able to produce the same effect over much shorter distances.

Such an offensive, which appears quite feasible in view of the present development of the aeroplane, could not hitherto be developed on the Western Front partly for the lack of adequate machines and partly for the pressing need of the armies for reconnaissance and fighting aeroplanes. It is obvious that until a sufficient number of such machines be made available it is useless to think of providing or attempting to provide aeroplanes for a great aerial offensive.

This is then a question that turns upon the productive capacity of the aircraft factories. Supposing the Allied output of aeroplanes could be enormously increased in the near future, then the immediate needs of the armies in the field could be more than met and the surplus of production be turned into supplying machines for an independent aerial offensive.

Such an eventuality may readily become an accomplished fact since America's entry in the war, for this country possesses all the requirements needed for the materialisation of such an offensive. The well-known American ability for quantity production, as well as the large number of enthusiastic sportsmen that is to be found in the United States, would undoubtedly make an ideal combination for realising a great bombing campaign against Germany. Such an offensive could be carried out by a large fleet of American aeroplanes operating as a separate unit, since its work would be separate, too, from the immediate needs of the armies in the field.

I shall endeavour to describe how such an aeroplane offensive could be carried out and what actions there may take place. To begin with, it is essential that it be carried out by night, for, given adequate instruments, a place can be reached by night just as surely as in daytime, while on the other hand there is less likelihood of losing machines by anti-aircraft fire or hostile aeroplanes.

At the base a hundred of these large machines are wheeled out in the darkness of the sheds; the engines are started up and the crews go on board. The latter are small in numbers compared to those required for handling a Zeppelin airship carrying an equal load of bombs, and small is the number of assistants required to launch the machines.

The wing tips and the tail of each aeroplane are illuminated with small lights, so that each pilot can see the other's machine and avoid collision. The navigating instruments are also lighted electrically, and by the aid of these the pilot is able to steer the aeroplane to its destination.

Fully equipped with their quota of bombs, they fly on their course to their destination until the leader in charge of the squadron gives the signal that the goal is reached; each machine then aims on the target that has been set for it and releases its bombs. Immediately with the dropping of the bombs, or perhaps before, owing to the noise of the engines, the attackers are met by a defence squadron of aeroplanes and also by anti-aircraft fire from the ground directed by searchlights.

Several of the big machines carry heavy guns, and these immediately go into action on the searchlight controlled batteries. With well-aimed fire, these searchlights are put out of action and darkness reigns once more. The flares which have been dropped in order to illuminate the ground and enable the target to be seen when dropping the bombs have gone out.

In the prevailing darkness it is almost impossible for the defender squadron to find the attacking force, which is now making for home. Lightened of their load of bombs, they are able to outfly the defenders, and their ability to climb more than outweighs the pursuit machines' extra speed and endows them with sufficient manœuvring ability to beat off hostile attacks.

The day is dawning when the bombing squadrons return to their sheds, with the report that some munition factory, steel works, or power station, has been completely wiped out, and that, for some time at least, that centre of hostile industry has been demobilised, and so much less will be available for the hostile armies.

Incidentally one might remark that it is easier to land large aeroplane in the dark than a small one, for large machi pull up quicker on the ground, and, owing to the cushioni effect of the big planes on the air between them and the grou the alighting speed is smaller than in the case of the small ae planes.

For bombing work, the large aeroplane is the ideal machi It is essential, when bombing, that the platform should steady, and that the man in charge of the bomb dropping sho have plenty of comfort, so that he may drop his bombs with so accuracy. A large machine affords a splendid platform on wh to lie, excellent sighting opportunities, and great all-rou steadiness. It follows, therefore, that bombing can be c ducted from a large aeroplane with far greater accuracy th from a small machine where the pilot or passengers have contend with lack of space and an unsteady platform.

Let us now turn to the question of effective fighting of s marines. The great point in favour of an airship for na patrol is that it is able to remain floating in the air with power shut off, the men in the car are comparatively comfortal and thus an excellent observation station is obtained for observi any hostile ships and sending back a wireless message to base.

Exactly the same advantages, except in point of hoveri are obtained with the large aeroplane. Owing to the excell possibilities of observation, a much closer watch can be k over an exceedingly large area, and much better observation c be obtained than with the ordinary small seaplane engaged the same work.

Owing to the large size of the aeroplane, a one, two, or ev three-pounder gun as well as many bombs can be carried, a if it is not possible to reach the hostile ship or submarine bef it submerges, the gun can be used with effect where the bo could not be dropped, owing to the distance of the targ Better bomb-sighting and more effective gun-fire may thus obtained than in the case of the small aeroplane, where o machine-guns, firing rifle ammunition, can be mounted and load of bombs is necessarily limited.

A fleet of such multi-engine aeroplanes could continuou patrol 300 to 400 miles out to sea and effectively protect in d time the shipping lanes by escorting incoming and outgoi vessels, and thus reduce to a large extent the submarine's abi to destroy commerce.

Another interesting feature of large aeroplanes is th greater economy from the point of view of production and ope tion in proportion to a number of small machines possessi equal carrying capacity and speed.

A large aeroplane of, say, 600 h.p. can carry a weight of 20 per horse-power, or 12,000 lb. of total weight, half of which effective load, so that we get a useful load of 10 lb. per hor power, or 6,000 lb. total.

Supposing, now, we had these loads separately carried by number of small machines of, say, 200 h.p., flying at a speed 130 m.p.h. Such machines would be able to carry about 8 t lb. per horse-power, of which only 1½ lb. per horse-power co be reckoned as useful load. For every one of these machin therefore, we should have 1½ times 200 of 300 lb. of useful load

For a total weight of 6,000 lb. to be carried, this would requ no less than twenty machines. But as the total horse-power these twenty machines would be twenty times 200, or 4,000, agai 600 h.p. required for the large aeroplane, it follows that operation of the latter will be about six times more economi than a corresponding number of small machines. A small nu ber of large machines, therefore, make a much smaller dema on the resources of a country than a large number of sm machines, for it reduces the engine power, fuel supply and nu ber of crews required, and, consequently, the cost of operation

It remains now to speculate as to the aspect of warfare in distant future when the extended use of large aeroplanes, co bined with new methods of land attack, will have revolutioni the art of war.

For obtaining accurate gunfire, the gun must be mounted a specially-made emplacement and have attached to it a suita aeroplane for spotting at long distance the effect of its she This aeroplane must be equipped with radio for reporting effect of the shells and be protected by fighting machines to b off any enemy aeroplanes.

One can imagine all this system changing in the wars of future. Instead of an artillery bombardment preceding the att of the infantry from the trenches, and covering the infantry they advance with a curtain of fire, the "preparatory fire" w be effected by aeroplanes carrying large numbers of heavy she

One imagines the attacking army equipped with large numb of bombing aeroplanes which, rising up into the sky and rema ing there at a height of 15,000 or 20,000 ft., will rain down on defending army a hail of shells, sweeping away the barbed w and entrenchments just as the ordinary artillery bombardment n does.

A continuous stream of large aeroplanes will be flying back a forth to fetch new loads of bombs to be dropped on the ener In front of them will sweep a cloud of small fighting aeropla

that will drive off the attackers which may endeavour to get at the bombing aeroplanes.

Below, instead of infantry charging the lines, masses of land battleships carrying infantry within their armoured walls will move forward as the way is cleared by the aerial bombradment.

At once we have a change from the present stagnant form of warfare: the trench is done away with, and the infantry, while maintaining its effective covering, has regained its mobility.

Play is thus again possible for the strategic and tactical abilities of the opposing generals, and warfare will, once more, become one of mobile operations, thus making possible prompt decisions.

THE HANDLEY PAGE BATTLE AEROPLANE.

A machine of the type herewith described, having accidentally landed within German lines, the following dimensional and performance data obtained during trials carried out by an Admiralty staff under Comdr. Seddon, R.N., may now be published:

Characteristics and Trial Performances.

Span, 100 ft.
Area, 1,700 sq. ft.
Gross weight, fully loaded, 11,500 lb.
Gross weight, normally loaded, 10,500 lb.
Weight, machine bare (including armour), 6,500 lb.
Horse-power, 540 (two 270 h.p. Rolls-Royce engines).
Area loading, normal, 3¼ lb. per sq. ft.; maximum, 6¾ lb.
Speed, loaded, normally, 90 m.p.h. Approximately, 40 m.p.h. low.
Climb, 10,000 ft. in 30 min. approximately.
Fuel capacity, gasoline, 400 B.I. gal. (equals 2,900 lb.).
Engine consumption, full power, 325 lb. per hr.
Endurance at full power, 9 hrs.
Endurance slightly throttled, 11 hrs.

Particulars of Load.

Gasoline	2,900 lb.
Oil	250 lb.
Crew, 3 men	540 lb.
Gun mountings and bomb gear	310 lb.
Total.....	4,000 lb.

To carry bombs, either fuel could be reduced or the load could be increased by 1,000 lb., as done in trials, or both. The designed bomb capacity is sixteen 65 lb., or 100 lb., or 112 lb. high explosive bombs (all of which fit the same gear). On a later design provision is made for carrying eight 250 lb. bombs. The maximum load of bombs which could be carried is, therefore, 2,000 lb.; with three machine-guns and ammunition the maximum armament load is, therefore, about 2,180 lb., which correspond to 5½ hours' full power fuel with the machine loaded to maximum.

If the armour is done away with entirely, the weight light is reduced to 6,000 lb. approximately, allowing either for engines of greater power or for an additional 500 lb. of useful load.

Later Improvements.

After the Admiralty trials, various improvements were made on the machine. These consisted of the following:

1. Suppression of armour as indicated above.

2. Reduction of head resistance of engine nacelles and radiators, as a result of which a speed of 95 m.p.h. was attained with the Rolls-Royce engines.

3. Increase of horse-power by the installation of two 350 h.p. Sunbeam engines. This power plant has a lower fuel consumption than the one first installed, for it only burns 335 lb. of gasoline per hour at 680 h.p. gross. Consequently the endurance remains practically unaltered, while the speed at altitude as well as the climb is greatly increased. With the Sunbeam installation, the maximum speed at 10,000 ft. altitude is about 94 m.p.h.

A noteworthy feature of the machine is that it has never been fitted with any servo-motor control gear; this has been found quite unnecessary, chiefly owing to the large amount of inherent stability embodied in the design.

War Uses.

Actual warfare experience has proved that where military objectives are well protected by anti-aircraft guns, attacks by aircraft should be made at night. Owing to chances of collision it is, therefore, axiomatic that machines for night bombing must be as large as possible so as to reduce numbers. "Pusher view," that is, a wide arc of vision, is also essential for accurate bombing, especially by night. The Handley Page seems, therefore, *par excellence* the type for strongly defended objectives. The use of large aeroplanes by day would scarcely be permissible over areas strongly defended with anti-aircraft guns, as good results are obtained with guns up to 14,000 ft. It is, however, quite legitimate to utilise this type for day bombing of objectives not strongly defended (or well practiced) that is, Essen and all towns in Germany behind the Rhine, provided these machines are exceptionally heavily armed against aircraft attack.

To be properly armed in this sense, at least three twin machine-guns would have to be carried and probably four twin machine-guns, which would require a total crew of six men. Examination of weights and loads indicated will show that no difficu would be experienced in carrying such armament into effe It should be noted also that the general policy is to accompa bombing machines with gun machines if possible, making t latter of same type as the former.

Notable Performances.

Among the most notable performances of the Handley Pa twin-tractor biplane may be mentioned (1) an altitude flight 7,180 ft. with twenty-two men aboard; (2) an altitude flight 13,000 ft. with full load, 10,000 ft. being reached in 25 minu (this flight was made with a Sunbeam-engined model); (3) flight from London to Paris in 2 hours 10 minutes (train a boat time, in peace, 7 hours 35 minutes); (4) a flight from Lo don to Rome with a crew of five in 7 hours' total flying time

THE ARROL-JOHNSON CADET CORPS.

The company of cadets, raised by the Arrol-Johnson Co., Lt to the number of 150, held their annual camp during the we end of September-8th-10th, at Lochmaben. On the Saturd evening a smoking concert was held, the labours of te pitching, etc., making any other form of activity impracticab

A Church Parade was held on Sunday morning, followed an inspection in the afternoon, when Mr. T. C. Pullinger, man ing director of Arrol-Johnson, Ltd., addressed the boys. T return march to Dumfries took place on the Monday mornir everyone being very pleased with the success of the affair.

U.S.A. PRODUCTION.

According to a report in "Aerial Age" of August 20 emanating from Washington, the United States, in close operation with the British, French and Italian Governmen will co-ordinate all industries entering into the great aviati programme upon which the nation embarked with the granti by Congress of a 640,000,000 dol. appropriation.

The Aircraft Production Board, acting for the Governme will arrange for the purchase of all aeroplane spruce and ot wood entering into construction and distribute it to Gr Britain, France, Italy and the United States in proportion to needs of each country.

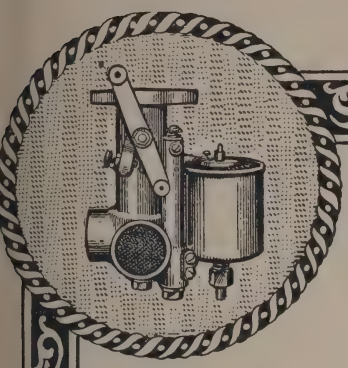
Ultimately all steel will be manufactured in this country, a distributed in the same way, releasing British, French a Italian steel for other war purposes.

SCIENTIFIC ADVERTISING.

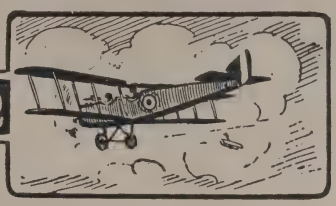
Attention is drawn to the work of Mr. George Webster, of Norton Street, Old Chapel, Manchester, who makes a special of aviation, motoring and engineering advertising. Mr. Webs has had practical experience in well-known aircraft concerns a he is, therefore, able to evolve designs which are not mer artistic, but technically accurate, and he has a number of clie among the advertisers in The Aeroplane. Mr. Webster is present engaged with the Avro Company, where he is in cha of the Publicity Department. He is also the Editor of the "J stick," the very readable house magazine of this pioneer firm.

Notwithstanding this work, Mr. Webster is free to underta advertising business for any other firm, and, as announced his note heading, he has branches at Liverpool, Stockport, a Bristol, which indicates a widely separated clientèle.

There is no doubt that effective designs are an import feature in successful advertising, and advertisers may find the selves relieved of much trouble and a good deal of anxiety placing their work in the hands of an advertising agent w thoroughly understands the special requirements of aviation.



THE WADKIN PATENT AUTOMATIC PROPELLER SHAPING MACHINE.

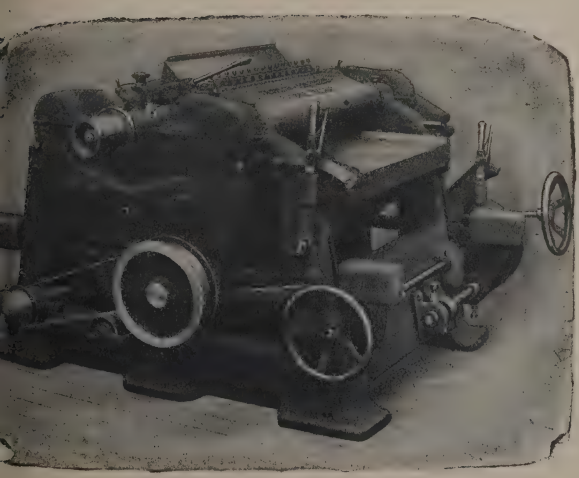


At this critical period of the war, when the energies and ti of most of the readers of The Aeroplane are taxed to th utmost in the production of aeroplanes, a photograph and d cription of the latest model of the automatic propeller shapi machine, manufactured by Messrs. Wadkin and Co., of Leicest will be interesting.

The machine has now been on the market nearly three yea During this period it has been constantly developed and i proved by incorporating in its design the practical suggestio of many of the propeller manufacturers

It is now firmly established as one of the most important a essential labour-saving machines in the propeller shop, and h already been installed by all the leading propeller makers, ma of whom have a number of these machines working night a day.

In order to give some idea of the amount of hand labour sa by the introduction of this machine, the makers state that 10-ft. two-bladed propeller may be cut in 1¾ hours by their st dard rate of feed, which gives a very good finish to the wo Other rates of feed may be fitted to the machine if desir which will enable a propeller to be shaped in 70 minutes w a slightly coarser finish. A four-bladed propeller is cut exactly double these times.



ZENITH CARBURETTER

Where there's a will there's a way - and the Zenith Carburetter is "doing its bit" on sea, on land and in the air.

AIRCRAFT MACHINERY.

Panel Planing & Thicknessing Machines for High-class Work

With Flexible Feed Roller and Chip Breaker, Tables on Inclined Slides and Patent Variable Feed Gear.

TYPE MZ.

Write for particulars.

One man can quite easily operate three machines, and is, indeed, doing so in several shops in the country, and keeping each machine constantly working.

The machine is of exceedingly simple construction and equally simple to operate. In fact, there is very little operating required as the machine is entirely automatic and merely requires starting and stopping as each blade is cut, and the work placing in and out of the machine.

The method of setting the work in the machine is also simple, but very effective, and serves also for indexing the blades. The block is built up in the usual way, but with the bottom lamina left 4⅜ ins. longer on each blade. On a centre line a 1-in. diameter hole is drilled in this extension piece in each blade to a template.

The centre hole may either be bored out 1⅛ in. to suit the mandrel of the machine, or bored out the finished size. If the latter method is adopted, it is necessary to use a bush to fit it, with a 1¼-in. diameter hole for the mandrel.

The propeller block is placed over the mandrel of the machine and sits on a face plate and is locked by a screwed nut. The extended tip fits over a steady pin and is locked by a hand nut.

The principle upon which the machine is based consists of forming a propeller blade by causing a roller to pass over the surface of an "original," the path followed by this roller imparting a similar motion to the cutter-arm as it passes over the work, as to cause the cutter itself to follow an exactly similar path.

The bed consists of a long casting, with machined ways, upon which a carriage is mounted. This carriage supports upon machined ways, upon its upper face, a reciprocating headstock worked by a crank motion. Upon this headstock are pivoted the cutter block and copy roller arms, and connected at their ends remote from the cutting tool by an adjustable link. The arms are balanced by a spring so that just sufficient weight is on the original as to keep the cutters in contact with the work.

The cutter block consists of twelve cutters of special shape, six cutters being on the front side of the block and six on the back side, so that the machine will cut with equal facility in either direction. The speed of the cutter block is 4,200 r.p.m., and the spindle on which it is mounted runs in ball bearings. By means of a flat belt running over a two-step pulley, mounted on ball bearings and carried by a bracket fixed to the sliding headstock, the drive is carried to the cutter block.

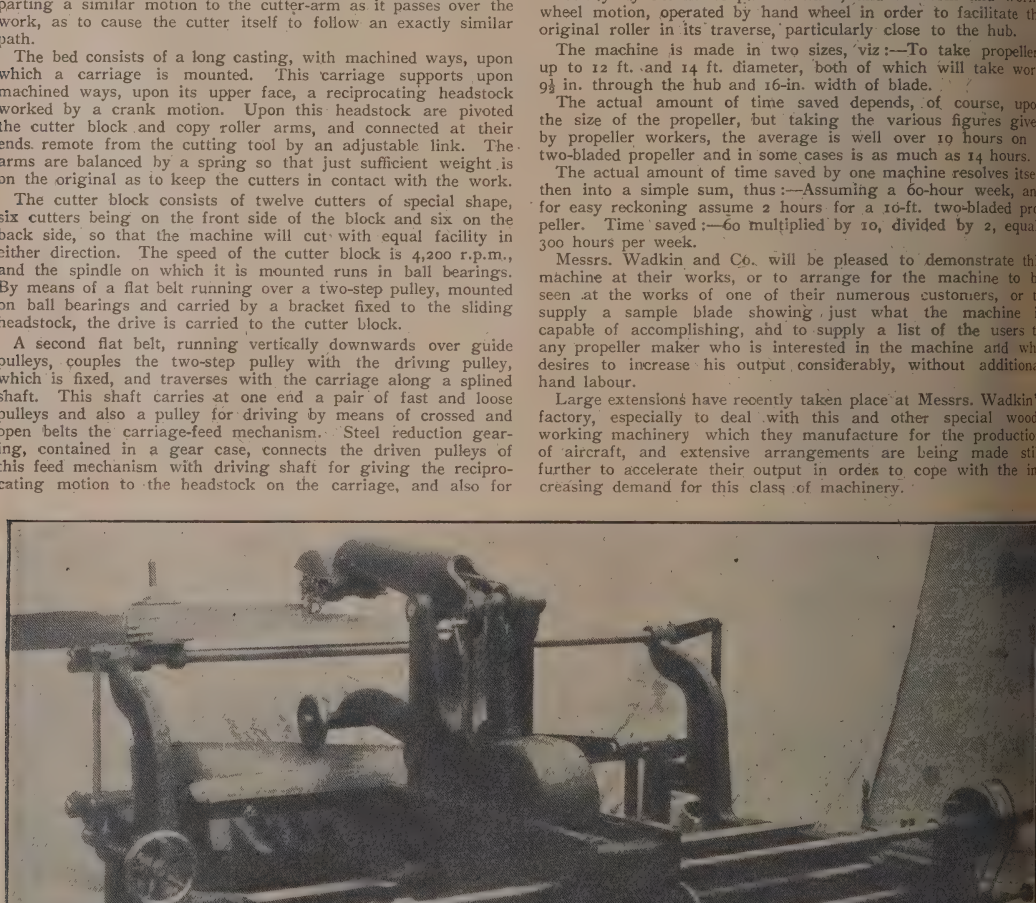
A second flat belt, running vertically downwards over guide pulleys, couples the two-step pulley with the driving pulley, which is fixed, and traverses with the carriage along a splined shaft. This shaft carries at one end a pair of fast and loose pulleys and also a pulley for driving by means of crossed and open belts the carriage-feed mechanism. Steel reduction gearing, contained in a gear case, connects the driven pulleys of this feed mechanism with driving shaft for giving the reciprocating motion to the headstock on the carriage, and also for giving the longitudinal traverse to the carriage by means of screw.

All gearing is of steel. Two stout horizontal turned bar mounted in a pair of brackets, are used to carry the mandrels an face plate for supporting the work and the original or cop The method of mounting the propeller block upon the mandr and the steady pin at its opposite end has already been explaine and the original is mounted in exactly the same manner. will be noticed that the original roller rests upon a wooden pla form, the function of which is to provide a support for the roll on leaving the surface of the original.

The original consists of a wooden block shaped on one sid only, exactly as the finished blade for the face side, and a simila block for the back side. By adopting this method a very sti original is obtained, which can be quickly made by the manufa turer in his own shop.

The wooden platforms are fixed to quadrant brackets mounte on the original supporting bar, and can be locked in any suitab position. These platforms are shaped to suit the edge and fac of the propeller in order to give a smooth and easy motion the roller-arm as it passes backwards and forwards over th original.

Owing to the variable shape of propellers, a motion is pr vided so that the original and the propeller block are tilted simu taneously by means of parallel links, and a worm and worm wheel motion, operated by hand wheel in order to facilitate th original roller in its traverse, particularly close to the hub.



The machine is made in two sizes, viz :—To take propelle up to 12 ft. and 14 ft. diameter, both of which will take wor 9½ in. through the hub and 16-in. width of blade.

The actual amount of time saved depends, of course, upo the size of the propeller, but taking the various figures give by propeller workers, the average is well over 19 hours on two-bladed propeller and in some cases is as much as 14 hours.

The actual amount of time saved by one machine resolves itse then into a simple sum, thus :—Assuming a 60-hour week, an for easy reckoning assume 2 hours for a 10-ft. two-bladed pr peller. Time saved :—60 multiplied by 10, divided by 2, equa 300 hours per week.

Messrs. Wadkin and Co. will be pleased to demonstrate th machine at their works, or to arrange for the machine to b seen at the works of one of their numerous customers, or t supply a sample blade showing just what the machine capable of accomplishing, and to supply a list of the users t any propeller maker who is interested in the machine and wh desires to increase his output considerably, without additiona hand labour.

Large extensions have recently taken place at Messrs. Wadkin factory, especially to deal with this and other special wood working machinery which they manufacture for the productio of aircraft, and extensive arrangements are being made sti further to accelerate their output in order to cope with the in creasing demand for this class of machinery.

TO INCREASE OUTPUT.—A Wadkin Propeller-shaper. The model blade is shown in position below, and, as the roller runs over it, the cutter on the end of the parallel arm above follows exactly the movements of the roller.

THE VERDICT.

What we want is the verdict of "the boys," after they have been trained in its use.

If the thing is no d——d good they will say so promptly, and with the utmost candour.

If, on the contrary, it meets with their approval, they will quickly be doing "stunts" with it, which will demonstrate its capabilities under every conceivable condition.

The verdict of "the boys" is the verdict best worth having.

THE PATENTS INDEX.

The subjoined list of inventions has been specially compiled by The Aeroplane from the current Official Patents Records.

Patent Applications.

Aeronautical Instrument Co. Balloons. No. 12899. Sept. 8th.
Ashworth, J. Aeroplanes. No. 12673. Sept. 4th.
British Aeroplane Varnish Co. Dopes or varnishes for aircraft. No. 12807. Sept. 6th.
Brown, E. E. Metal construction for aircraft. No. 12849. Sept. 7th.
Cleaver, H. C. Propellers for aircraft. No. 12921. Sept. 8th.
Connor, T. J. Flying-machines. No. 12755. Sept. 5th.
Jones, W. H. Rotary internal-combustion engines and propellers for aircraft, etc. No. 12672. Sept. 3rd.
Newton, J. M. Projectile for anti-aircraft guns. No. 12822. Sept. 7th.
Ratcliffe, J. R. Clinometers for aeroplanes. No. 12875. Sept. 8th.
Ravier, S. L. Aeroplanes. No. 12914. Sept. 8th.
Rowles, S. G. Gravity-controlled level-indicator for aircraft, submarines, etc. No. 12758. Sept. 6th.
Rupene, A. Aeroplanes. No. 12784. Sept. 6th.
Taylor, W. Apparatus for condensing and retaining compressed or liquefied gas in a receiver, for use with motor-vehicles, aeroplanes, motor-boats, etc. No. 12820. Sept. 7th.
Valda, A. H. Construction and working of aeroplanes. No. 12810. Sept. 6th.
Vickers, Ltd. Aircraft gun mountings. No. 12904. Sept. 8th.
Vickers, Ltd. Means for controlling fire of guns carried by aircraft. No. 12908. Sept. 8th.
Vickers, Ltd. Means for controlling fire of guns carried by aircraft. No. 12909. Sept. 8th.
Vickers, Ltd. Means for controlling fire of guns carried by aircraft. No. 12910. Sept. 8th.
Woosnam, A. Aeroplanes. No. 12742. Sept. 5th.

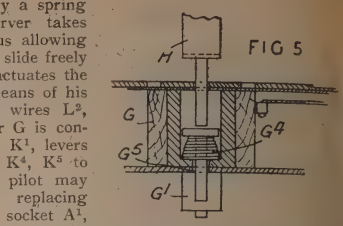
Complete Specifications Accepted, Prints of which can be obtained on and after Sept. 27th, 1917.

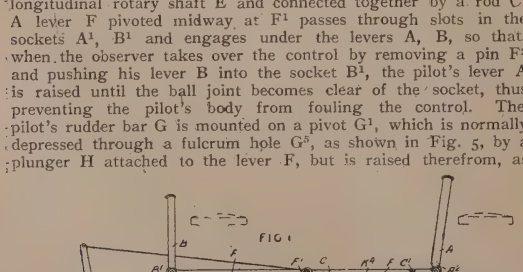
109,081. August 28th, 1916. Martin, J. V. Aircraft wing structures.
109,146. Nov. 1st, 1916. Sopwith Aviation Co., and Sopwith, T. Construction and arrangement of axle for aeroplanes and the like.
109,202. Jan. 29th, 1917. Gilbody, F. H., and Durrant, G. Brackets for pulleys, levers, or the like, such as are used on aircraft, motor-cars, and many other purposes.

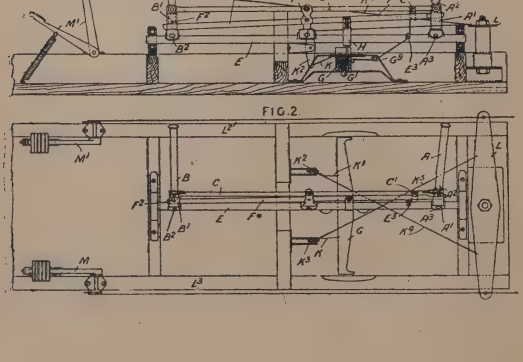
Abridgments of recently published Specifications.

107,674. Aeronautics. Power, R. F., Doveridge, Derby.

Steering and Balancing.—In dual-control mechanism for aeroplanes, in which the observer thrusts his operating-lever downwards into a socket in order to take over the control, means are provided whereby this downward movement of his lever renders the pilot's control gear inoperative and also whereby the pilot may resume the control at any time. The pilot's control lever A is ball-jointed at A^2 to a portion sliding in the usual socket A^1, and the observer's lever B is arranged to slide in a similar socket B^1, the sockets A^1, B^1 being pivoted at A^3, B^2 to a longitudinal rotary shaft E and connected together by a rod C. A lever F pivoted midway at F^1 passes through slots in the sockets A^1, B^1 and engages under the levers A, B, so that, when the observer takes over the control by removing a pin F^2 and pushing his lever B into the socket B^1, the pilot's lever A is raised until the ball joint becomes clear of the socket, thus preventing the pilot's body from fouling the control. The pilot's rudder bar G is mounted on a pivot G^1, which is normally depressed through a fulcrum hole G^5, as shown in Fig. 5, by a plunger H attached to the lever F, but is raised therefrom, as shown in Fig. 1, by a spring G^4 when the observer takes over the control, thus allowing the rudder bar G to slide freely when the observer actuates the rudder lever L by means of his pedals M, M^1, and wires L^2, L^3. The rudder bar G is connected by wires K, K^1, levers K^2, K^3, and wires K^4, K^5 to the lever L. The pilot may regain control by replacing his lever A in the socket A^1, the rudder bar G being at the same time drawn back into position by a cable connected to the lever F and passing over pulleys C^1, E^3, G^2, or by a spring. The socket B^1 is made deep enough to allow the lever B to be partly inserted for dual control for instructional purposes.







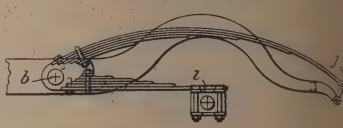


FIG 5

FIG 1

FIG. 2

107,750. Vehicle Springs. Pelterie, R. Esnault-, 11, Rue' d Milan, Paris. Addition to 2299/15. Convention date, Jul 6th, 1916.

Cantilever springs of the type described in the parent Specification have the point of suspension *i* of the axle almost in the line of, but slightly below, the points of attachment *b*, *j* of th upper springs.

THE AERONAUTICAL SOCIETY OF GREAT BRITAIN.

New Members.—The following have been elected members the Society in the various grades :—

Fellow.—Harris Booth, B.A., A.M.Inst.C.E., F.R.Met.Soc A.F.Ae.S.

Associate Fellow.—Alan Ernest Leofric Chorlton, C.B.E M.Inst.C.E., M.Inst.Mech.E., M.Inst.E.E., M.Sc.
Allan Lindsay Anderson.
Granville Eastwood Bradshaw.
Alfred John Sutton Pippard, M.Sc., A.M.Inst.C.E.
Capt. Hon. W. F. Forbes Sempill, R.F.C.
Harold Lord.

Member.—G. D. I. Seneviratne.
Lt.-Col. R. Mandeville Rodwell, R.F.C.
Comdr. William Bernard Murphy, R.N.
Arthur Francis Martin.
Howard Edward Latimer Voight.
William Elderton.

Associate Member.—Lt. B. Hackforth, R.N.A.S.
Major Leveson Scarth.

Student.—David Maxwell Buist.

7, Albemarle Street, W. W. Barnard Faraday, Sec.

THE NORTHAMPTON POLYTECHNIC INSTITUTE.

Full day courses in the theory and practice of civil, mechanica and electrical engineering will commence on Monday, Octob 1st, 1917, at the Northampton Polytechnic Institute, St. John Street, E.C.1.

The courses in civil and mechanical engineering inclu specialisation in automobile and aeronautical engineering, an those in electrical engineering include specialisation in radi telegraphy.

The entrance examinations are on Tuesday and Wednesda September 25th and 26th, 1917.

These courses include periods spent in commercial workshop and extend over four years. They also prepare for the degree B.Sc., in engineering at the University of London. Fees, £ or £11 per annum. Three entrance scholarships of the value £52 each will be offered for competition at the entrance e amination in September, 1917.

The Principal of the Institute is Dr. R. Mullineux Walmsle D.Sc. The system of education is of the highest quality, and t classes can be strongly recommended to all who wish to learn.

AN AMERICAN TRADE NOTE.

According to a report in the "Aerial Age Weekly" for Augu 20th, the accuracy of which cannot be guaranteed, plans for th manufacture of powerful British-type bombing airships (*sic*), t be used by the American Flying Corps, were discussed at conference between Mr. W. H. Workman, a "British aer expert," and members of the Aircraft Production Board. "O machine of the type (the twin-motored Handley Page) which is proposed to manufacture, has made a flight from London Rome."

(*Continued from page* 800.)

Two of our machines are missing.

Sept. 14th, 9.3 p.m.—On the 13th inst. the weather was ain very unfavourable for aerial observation. Eighty bombs ere dropped by our aeroplanes on the enemy's billets east of ens, and his troops in the open and in their trenches were rraged by machine-gun fire from a low altitude.

There was a certain amount of fighting under difficult con- ions.

Three of our machines are missing.

Sept. 15th, 9.25 p.m.—On the 14th inst. the cloudy weather ntinued, with a strong west wind, making artillery observation ficult and greatly favouring the enemy's machines in combats.

Eleven heavy bombs were dropped by us on the railway station rth of Charleroi and 75 bombs on railway stations, billets, and campments nearer the lines.

Three enemy machines were brought down, one falling behind r lines, and six driven down out of control.

Four of our machines are missing.

Sept. 16th, 9.9 p.m.—On the 15th inst. there was no im- ovement in the weather, and a strong west wind still rendered ficult the return of our machines from bombing raids and om fighting behind the enemy's lines.

Artillery and photographic work was continued, and three tons bombs were dropped on two hostile aerodromes east of urtrai, on an aerodrome and an ammunition dump north-east Cambrai, and on hostile billets and hutments.

Six German machines were brought down in air fighting and o driven down out of control.

Four of our machines are missing.

Sept. 17th, 9.19 p.m.—On the 16th inst. visibility improved, d a good deal of successful artillery work and photography s accomplished.

During the fine intervals enemy aircraft were active and were ain greatly favoured by the strong west wind. In the course the morning hostile machines dropped 50 bombs behind our es. Very little damage was done.

Our aeroplanes dropped 143 bombs on a German aerodrome d on hostile billets and fired many thousand rounds from their achine-guns at various targets on the ground.

In particular a body of 2,000 German infantry were engaged th machine-gun fire from a height of 100 ft. and scattered.

Six German aeroplanes were brought down in combat and four others were driven down out of control. In addition one hostile machine was shot down in our lines by anti-aircraft gunfire.

Eight of our aeroplanes are missing.

War Office Communiqué.

Sept. 15th.—The G.O.C. the British Forces in Macedonia reports :—

During the past week our aeroplanes have bombed the enemy's encampments and dumps at Rupel, Vetrina, and Cernista (Struma front), causing considerable damage.

The Casualty List.

Reported Sept 12th.

Killed.—Hardwick-Terry, Capt. L. A., R.E., attd. R.F.C.

Previously reported Missing, now reported Killed.—Preston, Lt. R. A., M.C., Linc. R., attd. R.F.C.

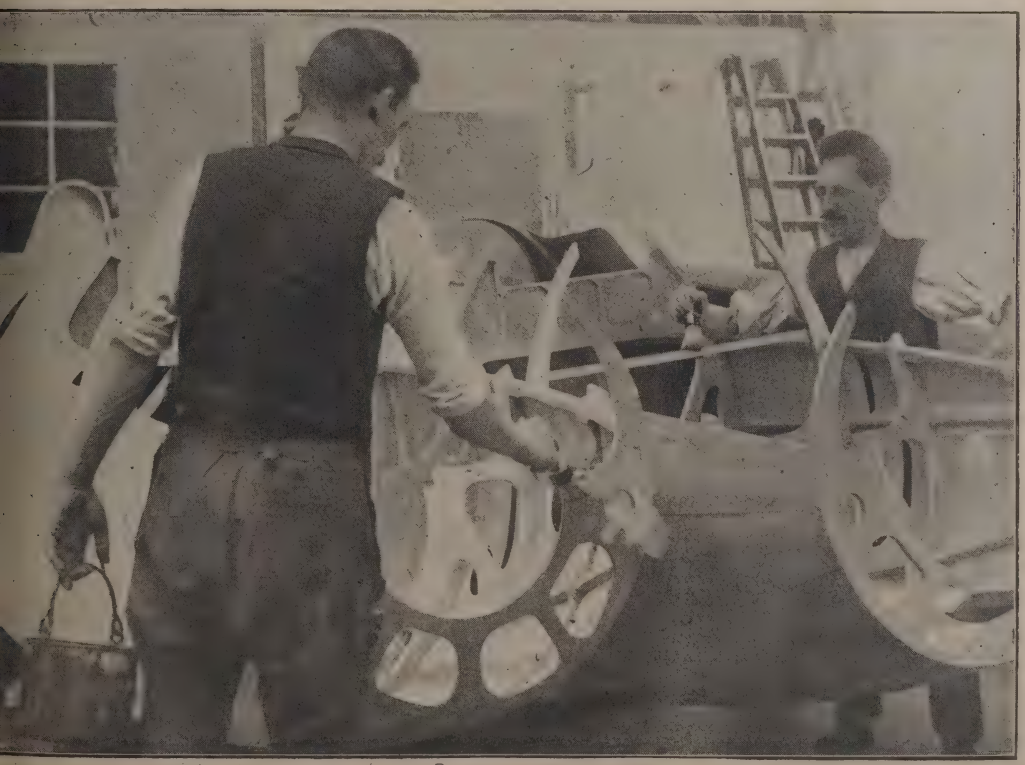
Previously reported Wounded, now reported Died of Wounds.—Watt, Sec. Lt. N. L., Cav., Spec. Res., attd. R.F.C.

Wounded.—Beatty, Sec. Lt. C. W., R.F.C.
Campbell, Sec. Lt. A. W., R.F.C.
Phillips, Sec. Lt. V., R.F.C.
Thomas, Lt. F. W. H., Yeo. and R.F.C.
Wilcox, Sec. Lt. S. L., R.F.C.

Missing.—Bacon, Sec. Lt. E. S., R.F.A. and R.F.C.
Kember, Sec. Lt. W., Lan. Fus. and R.F.C.
Madge, Lt. J. B. C., R.F.C.

Previously reported Missing, now reported Prisoner in German Hands.—Colledge, Sec. Lt. G., Yeo. and R.F.C.

Reported Sept. 13th.



Previously reported Missing, now reported Killed.—Fullalove, Sec. Lt. G. Y., R.F.C.

Died of Wounds.—Gordon-Kidd, Capt. A L., D.S.O., R.F.C.

Missing.—Sant, Sec. Lt. E. M., Essex R., attd. R.F.C.

Previously reported Wounded and Prisoner, now reported Died of Wounds as Prisoner in German Hands.—Middleton, Lt. J. R., R.F.C.

Previously reported Missing, now reported Prisoners in German Hands.—Chapman, Sec. Lt. J., High. L.I., attd. R.F.C.
Henderson, Sec. Lt. J. F., R.F.C.
Jeff, Sec. Lt. R. N. W., R.F.C.
Moore, Lt. M., Y. and L.R., attd. R.F.C.
Read, Sec. Lt. L., R.F.C.
Tinney, Sec. Lt. H. G., R.F.C.

GERMAN AEROPLANES IN THE MAKING.—Varnishing the fore-end of Albatros fuselages.

AUSTRALIAN FORCE.—WOUNDED.—Wilson, Sec. Lt. G. C. Fl. C.
PREVIOUSLY REPORTED MISSING, NOW REPORTED WOUNDED AND PRISONER IN GERMAN HANDS.—Norvill, Lt. V. A., R.F.C.
PREVIOUSLY REPORTED MISSING, NOW REPORTED PRISONER IN GERMAN HANDS.—Wearne, Sec. Lt. A., Fl. C.

Reported Sept. 14th.

KILLED.—Cleghorn, Capt. H. S., R.E. and R.F.C.
WOUNDED.—Burgess, Sec. Lt. V. W., R.F.C.
Bush, Lt. R. F. L., R.F.A., attd. R.F.C.
Willmott, Lt. S., R.F.A., attd. R.F.C.
MISSING.—Bird, Lt. A. F., Norf. R. and R.F.C.
McDonald, Lt. K. W., R.E. and R.F.C.
Spencer, Sec. Lt. W. A. L., R.F.C.
Williams, Lt. S. W., Essex R. and R.F.C.

Reported Sept. 15th.

KILLED.—Clegg, Lt. R. L., Lan. Fus., attd. R.F.C.
Martin, Lt. R., Yeo., attd. R.F.C.
WOUNDED.—Alexander, Sec. Lt. B. S., Leic. R., attd. R.F.C.
Baragar, Lt. F. B., R.F.C.
Cleobury, Sec. Lt. S., S. Staff. R., attd. R.F.C.
Sotham, Sec. Lt. R. C., R.W. Kent R., attd. R.F.C.
Ward, Lt. G. F., R.F.C.
MISSING.—Heywood, Lt. A. T., R.F.C.
Pickett, Sec. Lt. A. C., R.F.C.
Pickstone, Sec. Lt. C., R.F.C.
Pullen, Lt. C. J., R.G.A. and R.F.C.
NEW ZEALAND FORCE.—PREVIOUSLY REPORTED MISSING, NOW REPORTED KILLED.—Masters, Sec. Lt. G., Pioneers, attd. R.F.C.

Reported Sept. 17th.

KILLED.—Payne, Sec. Lt. W. S. L., M.C., R.G.A., attd. R.F.C.
Sandys, Lt. W. E., R.F.C.
Wray, Sec. Lt. T. E., R.F.C.
PREVIOUSLY REPORTED MISSING, NOW REPORTED KILLED.—Thompson, Sec. Lt. W. G., Suff. R. and R.F.C.
DIED OF WOUNDS.—Williams, Sec. Lt. A. T., R. Welsh Fus., attd. R.F.C.
WOUNDED.—Moore, Sec. Lt. G. N., R.F.C.
Simmance, Lt. J. A., R.W. Surr. R., attd. R.F.C.
Sutton, Capt. B. E., D.S.O., M.C., Yeo. and R.F.C.
MISSING.—Barber, Lt. B. K. B., North'd Fus., attd. R.F.C.
Binns, Sec. Lt. J. H., R.F.C.
Harper, Lt. S. A., M.C., Ches. R., attd. R.F.C.
Robinson, Sec. Lt. E. D. S., R.F.C.
Scarborough, Sec. Lt. F., R.F.A., attd. R.F.C.
Sharp, Capt. C. C., R.F.C.
Wightman, Sec. Lt. J. F., R.F.C.
PREVIOUSLY REPORTED MISSING, NOW REPORTED DIED OF WOUNDS AS PRISONER IN GERMAN HANDS.—Hay, Lt. R. B., M.C., W. Yorks. R., attd. R.F.C.
PREVIOUSLY REPORTED MISSING, NOW REPORTED PRISONERS IN GERMAN HANDS.—Coombs, Sec. Lt. V. C., R.F.C.
Hill, Sec. Lt. A. B., R.F.C. Fl. C.
AUSTRALIAN FORCE.—WOUNDED.—Smith, Sec. Lt. R. M., M.C.

Reported Sept. 18th.

KILLED.—Holman, Lt. C. G., K.O.S.B., attd. R.F.C.
Shields, Lt. W., Manch. R., attd. R.F.C.
DIED OF WOUNDS.—Harding, Lt. S. A., R.F.C.
WOUNDED.—Craig, Sec. Lt. A. D. K., R.F.C.
Forster, Sec. Lt. F., R.F.C.
MISSING.—Macniven, Lt. A. O., High. L.I. and R.F.C.
Huggard, Sec. Lt. J. C., R.F.C.
Neill, Lt. J. W. F., R. Scots., attd. R.F.C.
Webster, Sec. Lt. T. M., R.F.C.
PREVIOUSLY REPORTED PRISONER, NOW REPORTED WOUNDED AND PRISONER IN GERMAN HANDS.—French, Lt. G. S., Cambs. R. and R.F.C.
CANADIAN CONTINGENT.—WOUNDED.—Campbell, Lt. W. A., Cent. Ont. R., attd. R.F.C.
Guillon, Lt. G. M., Que. R., attd. R.F.C.
Pannill, Lt. A. H., M.C., E. Ont. R., attd. R.F.C.
PREVIOUSLY REPORTED MISSING, NOW REPORTED DIED AS PRISONER IN GERMAN HANDS.—Drummond, Lt. L., Engrs., attd. R.F.C.
PREVIOUSLY REPORTED MISSING, NOW REPORTED PRISONERS IN GERMAN HANDS.—Bean, Lt. C. A. S., B.C. R., attd. R.F.C.
MacKay, Lt. W. B., Cent. Ont. R., attd. R.F.C.

CASUALTIES AMONG WARRANT OFFICERS, N.C.O.'S AND MEN.
THE DATES ARE THOSE OF THE OFFICIAL LIST.

KILLED.

SEPT. 3rd.—R.F.C.—Bennetts 30163 2nd Cl. Air Mech. H. V. (Lewisham, S.E.).
SEPT. 8th.—Webb 87713 2nd Cl. Air Mech. F. A. (Ramsgate).

DIED OF WOUNDS.

SEPT. 3rd.—R.F.C.—Brown 15108 1st Cl. Air Mech. W. F. (New Cross, S.E.).

DIED.

SEPT. 3rd.—R.F.C.—Kitchingman 38245 2nd Cl. Air Mech. H. R. (Islington, N.).

WOUNDED.

SEPT. 3rd.—R.F.C.—Goodall 15912 1st Cl. Air Mech. S. H. (Walthamstow, E.); Harvey-Bathurst 49181 Sgt. A. R. (Piccadilly, W.); Velati 8551 1st Cl. Air Mech. H. C. (Clapham, S.W.).
SEPT. 8th.—Sunshall 9899 1st Cl. Air Mech. K. W. (London W.C.); Clark 7170 Sgt. W. R. (Kingston, Jamaica).

MISSING.

SEPT. 6th.—RIFLE BRIGADE, attd. R.F.C.—Davis 1756 H. (Birmingham).
PREVIOUSLY REPORTED MISSING, NOW REPORTED PRISONERS OF WAR IN GERMAN HANDS.
SEPT. 3rd.—R.F.C.—Harris 87534 2nd Cl. Air Mech. W. (Ironville); Walker 6757 Sgt. T. (Barwick-in-Elmet).

AUSTRALIAN IMPERIAL FORCE.

DIED.

SEPT. 7th.—A.F.C.—Sloane 694 W. D.

PERSONAL NOTICES.

DEATHS.

ANGOOD.—Second Lieut. Percival G. Angood, R.F.C., w killed in a flying accident near Chippenham, Wiltshire, on Sep 11th. His machine nose-dived, and fell into a tree.

ARNOLD.—Sec. Lt. H. E. Arnold, R.F.C., who was r ported missing on Dec. 26th, 1916, and is now officially report to have died of wounds on that date, was the only son of M and Mrs. H. Arnold, King's Cross, N.

ASTON.—Sec. Lt. Aston, whose death was announced la week, was the second son of Mr. and Mrs. F. W. Aston, Grenville, Durlston Road, Kingston, was educated at Tiffi School, and at the outbreak of war enlisted in the R.N.A. After becoming a Chief Petty Officer, he was granted a co mission in the R.F.C. He was 28 years of age.

BANNATYNE.—Major E. J. Bannatyne, D.S.O., R.F.C died on Sept. 11th at the Cirencester Hospital from the effec of an accident he met with on August 30th.

During a flight his machine caught fire, but Maj Bannatyne stuck to the controls and brought the aeropla within 40 or 50 feet of the ground. He was then driven by t flames from his seat, crawled along the tail, and jumped cle fortunately falling on some newly-dug ground.

He was badly burned and sustained fractures of the arm a collar-bone. He rallied well from the shock, but tetanus supe vened, and to this he succumbed.

Major Bannatyne, D.S.O., Hussars and R.F.C., was t only son of Mr. and Mrs. A. E. Bannatyne, of Glen Beva Croom, Co. Limerick. He was 26 years of age, and w educated at Wellington College and Caius College, Cambridg He joined the 19th Hussars in 1913, and went to France wi that regiment in August, 1914. He returned to England November of the same year on sick leave, during which tim he qualified for his flying certificate.

He was in the Experimental Flight at Upavon, until Febr ary, 1916, when he was sent to Egypt.

He was given a squadron at Ismailia, and proceeded later El Arish. He returned to England last June.

He was mentioned in dispatches for his good work in t operations against the Sultan of Darfur, and for subseque good service with the Army in Egypt. Besides being an ef cient officer, he was highly esteemed by all who served wi him, and his death will be deeply regretted, especially und such circumstances.

BILLING.—Sec. Lieut. Kitto Billing, R.F.C., an Australi aviator, was killed on Sept. 14th by falling from an aeropla while flying near Birmingham. He ascended alone in t machine, and having attained a height of about 2,000 ft. loop the loop several times. He was then seen to fall from the ae plane, which righted itself, but subsequently crashed in a wo at Water Orton.

At the inquest held by the Warwickshire Coroner on Sep 17th, Major Sheldon said that Mr. Billing came to the ae drome a month ago with previous flying experience gained Canada. He had passed through the school, and, having obtain his pilot's certificate, was due the next day to leave the grou to go to another station for a course of aerial gunnery.

He was having a final fly round, and ascended alone in two-seater. The witness saw the aeroplane descend at a ve steep angle from a height of 1,500 to 2,000 ft. When it reach the ground no aviator was to be found, and the body was n discovered until next day. His theory was that when in the a the pilot received a sudden jerk, which, by bringing undue pre sure on the belt, broke the pin and caused the belt to fly ope and released the pilot's body.

A private resident in the locality said he saw the pilot fall fro the machine.

Capt. Wilson, R.A.M.C., said there was a fracture of the ba of the skull. The officer probably died before he reached t ground, but preconceived opinions had been shattered by rece experiences. An officer, who fell 3,000 ft., assured the witne that he retained consciousness until 200 ft. from the groun A verdict of accidental death was returned.

BISHOP.—Second Lieut. Bernard Bennett Bishop, Duke

LONDON WAREHOUSE—

16, Finsbury Street, E.C. 2.

Cornwall's Light Infantry, attd. R.F.C. (killed in action on Sept. 9th), was eldest son of Engineer Captain Bishop, R.N., and of Mrs. Bishop, of Saltash. He had served in the ranks of the London Regiment before getting his commision in December, 1917.

BUSBY.—Sec. Lt. Harry Eldred Busby, R.F.C., aged 19, of Wellington Road, Hampton Wick, was killed on Sept. 11th. His machine, while descending from a height of 400 ft., suddenly nose-dived, and the pilot was instantaneously killed. It was said to be his first "solo" flight.

It was suggested at the inquest at Henlon on Sept. 15th that he might have fainted. The machine had been used the same day, and there had been no difficulty in controlling it. A verdict of accidental death was returned, and sympathy was expressed by the Coroner and jury with his parents, who live at Wellington Road, Hampton Hill.

BUXTON.—Sec. Lt. George Barclay Buxton, Norfolk Regt., attached R.F.C., whose death was reported last week in this paper, was last seen flying east, attacking four enemy machines well over the German lines, having previously accounted for one. He was 24 years of age, and the third son of the Rev. Barclay F. Buxton, a missionary in Japan, and late of Widbury, Ware. When war broke out he was in British East Africa, and joined the King's African Rifles as a Scout. Later he returned to England, and after two months' training as an officer joined the Norfolks on active service. For nine months he was A.D.C. to Major-General Hare. Hearing of the need of R.F.C. pilots he returned to England, and quickly won his pilot's wings. He went out to France in July, 1917. One writes to say:—"Though he has only been here a short time he is a great favourite, and is considered a most capable pilot." He was educated at St. Andrew's School, Southborough, and at Repton. His eldest brother Murray, Norfolk Regt., was severely wounded at the battle of Gaza, and won the Military Cross, which his younger brother, Capt. Godfrey Buxton, Duke of Wellington's Regt., has also received.

CLEGHORN.—Capt. Herbert Stuart Cleghorn, R.E. and R.F.C., who was killed in action on Sept. 2nd, was the third son of John and Margaret Cleghorn, Clifton, Alyth. He was 26 years of age.

COLE.—Sec. Lt. Maxwell G. Cole, R.F.C., who was reported missing on May 18th, and is now officially reported killed, was the youngest son of W. H. Cole, Esq., J.P., and Mrs. Cole, of Bourne House, Brimscombe, Glos. He was 18 years of age.

CRONHELM.—Lt. Arthur Geoffrey Cronhelm, London Regt. and R.F.C., reported accidentally killed, was the youngest son of Mr. and Mrs. Theodore Cronhelm, of Craigend, Howth, Co. Dublin, and was educated at Christ's Hospital, Horsham, where he was a member of the Cadet Corps and the Bisley Reserve. He had been in Chile, but returned home on the outbreak of the war, and in February, 1915, obtained his commission. He fought in the battles of Neuve Chapelle, Festubert, and Loos, being wounded in the last. Subsequently, he saw service on two other fronts, and recently became attached to the R.F.C. In November, 1916, he married Gladys, daughter of Mr. David M. Steen, formerly of the Ceylon Civil Service.

CROSBIE.—Lt. John Colin Crosbie, R.G.A., attached R.F.C., who died on Sept. 7th, was the only son of Arthur and Agnes Crosbie, Northlands, Hadley, Barnet.

DOWNING.—Lieut. George Guy Barry Downing, R.F.C., whose death was announced last week, was the third and youngest son of Mr. and Mrs. G. C. Downing, of Beverley, Llanishen. He was educated at Waynflete, near Reading (Rev. J. H. Wilkinson), and at Charterhouse (Hodgsonsites, Mr. T. E. Page), where he was a member of the cadet corps and took a great interest in the scouts. After leaving Charterhouse he studied art at the Slade School, London. In August, 1914, he joined the Old Public School Boys' Training Camp at Tidworth Pennings, was recommended for a commission, and posted to the Welch Regiment. He applied for transfer to the Royal Flying Corps, but accompanied his regiment to France and was wounded on September 25th, 1915, at the Battle of Loos.

He was subsequently transferred to the Royal Flying Corps, and after the usual training was in July 1916, sent to the front, where on September 2nd, 1916, while flying over the German lines his machine was seriously damaged by German anti-aircraft gun fire and he was wounded. In these circumstances, attacked by two German machines, he succeeded in driving them off, and in landing within the French lines. He was sent home, and when recovering from his wounds had a severe attack of diphtheria.

Certified fit for light duty in March last he subsequently acted as instructor at aerodromes in this country. He was recently under orders for the front, but these were countermanded, and he was ordered to return to Scotland as an officer of a training school, where he had been only a few days when the accident happened. He had considerable talent as an artist; a number of his drawings have been reproduced in the illustrated magazine "Colour," and he had every prospect of a successful career. He married in April, 1915, Miss E. E. Evans, youngest daughter of Mr. Edwin Evans, senior, and leaves a son.

FAY.—At Weybridge, on Sept. 17th, an inquest was held an air mechanic named John Fay, who was knocked down an aeroplane which was ascending at Brooklands. Upon reaing an height of 60ft. the engine stopped, causing the machi to dash along a short distance until its progress was stopp by sheds, into which it crashed. One of the planes struck F fracturing his skull. He was fetching petrol to fill the tanks his own aeroplane. The jury returned a verdict of acciden death. Fay was a Manchester man and leaves a widow.

FITZHERBERT.—Capt. W. W. Fitzherbert, Royal Suss Regt., attached R.F.C., who was reported missing on July 7 and is now unofficially reported killed on that date, was t third son of the late W. A. Fitzherbert, of The Hutt, Wellingto New Zealand, and of Mrs. W. A. Fitzherbert, now residing Saxes Plat, Rudgwick, Sussex, and nephew of Mr. and M S. T. Fitzherbert, of 17, Chepstow Villas, W.11.

GORDON-KIDD.—Capt. Arthur Lionel Gordon-Kid D.S.O., R.F.C. (died of wounds), passed from the 4th Drago Guards into the R.F.C. He was appointed a Companion of t Distinguished Service Order in August, 1916, for conspicuo gallantry, skill, and determination.

According to the official account: "On one occasion he div his machine from a height of 7,500 ft. to 900 ft., and placed bomb on the enemy's ammunition train, which set it on fi and blocked the line. A few days afterwards he perform another very hazardous undertaking well within the enemy lines, whilst exposed the whole time to all descriptions of hea fire." In October, 1916, he was promoted Captain and Flig Commander.

HARDWICK-TERRY.—Capt. L. A. Hardwick-Terry, Roy Engineers, Flt. Comdr., R.F.C., was killed on August 31 when practising at a height of 2,000 ft. In making a verti dive with the engine full on, one of the wings of his aeropla became detached, and he crashed into a wood. The machi was smashed, but Capt. Hardwick-Terry's body was fou without even a cut. On the arrival of his comrades a fe minutes later, however, life was extinct.

Capt. Hardwick-Terry was the only child of Mr. and M E. Hardwick-Terry, of Urquhart, Berkhamsted, Herts, a a grandson of the scientist, Alfred Senior Merry. He w educated at Merchant Taylors and Berkhamsted, and fr childhood showed remarkable aptitude for science and engine ing. He joined the Inns of Court O.T.C., and obtained h commission in the Royal Engineers in February, 1915. Aft seeing service with the Anzacs in Egypt, he volunteered on h return to England for the R.F.C., and at the time of his dea had been flying at the front for nearly eight months. Ca Hardwick-Terry was 21 years of age.

JARDINE.—While flying at Montrose on Sept. 13th Se Lieut. Roland Jardine, Scots Greys, attd. R.F.C., was kille He had just ascended but, turning too quickly, his machine no dived.

Sec. Lt. Ronald James Jardine was the only son of Mr. a Mrs. Jardine, of Jardine Hall, Lockerbie, N.B. He w educated at Mr. Hawtree's School, Westgate-on-Sea, and aft wards at Eton. Intended for a military career, he proceeded Sandhurst, and on passing the necessary examination receiv a commission in the Royal Scots Greys, on August 15th, 191 Subsequently, he transferred to the Flying Corps. He was years of age. He was a nephew of Mr. Charles Bright, t well known engineer, and a member of the Air Enquiry Co mittee.

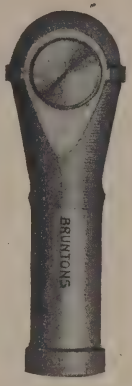
LE GALLAIS.—At an inquest at Faversham on Sept. 17th the body of Lieut. Reginald Le Gallais, R.F.C., who was kill while flying on Sept. 15th, another officer who witnessed the f said he thought an interplane strut broke, causing the left-ha wings to collapse, and the machine to fall out of control. M Le Gallais, who had flown a good deal in France, was 19 yea of age, and belonged to Jersey.

LEDGER.—Lieut. Aimé Antoine Ledger, Canadian Infantr attd. R.F.C., was killed at Rustington, near Littlehampto on Sept. 11th.

His machine was observed to be flying very low, close to t sea, when some part of the aeroplane broke and fell. H appeared to be trying to land, but the machine fell into the s some 400 yards from the shore. Mr. Ledger got clear of t wreckage and tried to swim ashore, but he suddenly threw up h hands and disappeared. Unfortunately no assistance was at ha at the moment, and when motor-boats and patrol vessels arriv they could find no trace of the aviator. The machine w towed ashore a complete wreck. The body has been recovered.

MATHESON.—Lt. Alexander Perceval Matheson Matheso A.S.C., Actg Flt. Comdr., R.F.C., whose death was announc last week, was the grandson of the late Sir Alexander Math son, Bart., of Lochalsh, whom he would eventually have su ceeded.

Mr. Matheson was educated at Oundle, intending to take t engineering as a profession, but on leaving school he enter the Ontario Agricultural College, Guelph, Canada, taking four years' course in farming and forestry.



When war was declared he returned to Littlehampton, a

D. ANDERSON, & SON, Ltd., Lagan Felt Works, Belfast; and Roach Road Works, Old Ford, London, E.

received a commission in the A.S.C. two weeks after his arrival. In November, 1916, he was attached R.F.C. as pilot, and in February left for the front with his squadron, and was stated to be one of the bravest and best pilots in the squadron.

MUIR.—The Grantham district coroner was notified on Sept. 13th of the death of Capt. S. K. Muir, R.F.C., who was killed while flying. His home was in Melbourne, Australia.

PALMER.—At Lincoln, on Sept. 17th, an inquest was held on the body of Lieut. William Saul Hudson Palmer, R.F.C., who fell while flying in Lincolnshire. On reaching the ground the machine burst into flames, and before the aviator could be released he was severely burnt. He died from shock four hours later. The evidence showed that Mr. Palmer, who was 19 years of age, was a keen aviator. This was his first flight alone, though he had previously had entire control when accompanied by his instructor. It was further stated that the left wing of the aeroplane dropped and the machine fell. The jury returned a verdict that death was purely accidental.

SPEAR.—Sec. Lieut. Norman Victor Spear, R.F.C., whose death was announced recently, was born in Norway and educated at Askes School, Hampstead, where he won the silver medal. At the outbreak of the war he was employed in the office of the secretary of the Institution of Civil Engineers. He joined the London Scottish in 1911. Not having fully recovered from an operation he was prevented from going to France with his battalion, but was passed for service and rejoined with a draft in November, 1914. He was a sergeant in the Scouts section when he was severely wounded at Loos, on September 25th, 1915, and was awarded the Military Medal.

On recovery he was recommended by his commanding officer for a commission, and in September, 1916, he was gazetted to the Royal Flying Corps. He obtained his pilot's certificate last March, and at the time of his death was acting as an instructor with a Training Squadron. He and his mechanic lost their lives while bringing back to their station a machine which had been forced to land in another part of the county.

The tributes received from those among whom he worked, fought, and died bear witness to his modest, serene, and kindly nature, and to his high ideals of duty and of a soldier's calling.

TREADWELL.—Lieut. R. Naylor Treadwell, M.C., Essex Regt., attd R.F.C., who died on Sept. 9th at a casualty clearing station, of wounds received in action on August 11th, was the only surviving son of Mr. O. F. N. Treadwell and Mrs. Treadwell, 90, St. George's Square, S.W.1, and brother of Mrs. G. H. Walford, Kohat, Camberley.

WILKINSON.—Sec. Lt. Harold Reid Wilkinson, R.F.C., who died on Sept. 10th, at Queen Alexandra's Hospital, of wounds received in action on May 10th, 1917, was the son of the Rev. F. Wilkinson and Mrs. Wilkinson, of Toronto, Canada. He was 24 years of age.

Engagements.

COWIE—DUTTSON.—An engagement is announced between Lt. J. Douglas Cowie, Argyll and Sutherland Highlanders and R.F.C., only son of Mr. and Mrs. J. W. Cowie, Heathside, Putney, and Phyllis May, only daughter of Mr. Stanley W. Duttson, 19, Bramham Gardens, South Kensington, S.W.

HILL-MORTON.—A marriage has been arranged, and will shortly take place at Houghton, Stockbridge, Hants, between Major Roderic Hill, M.C., R.F.C., elder son of Professor and Mrs. M. J. M. Hill, and Helen, elder daughter of Lt.-Col. E. R. Morton, Indian Army (retired), and Mrs. Morton (*née* Edwards, of Mess Strange, Shropshire).

SEAL—HILL.—The marriage arranged between Lieut. J. Darell Seal, Essex Regiment, attd R.F.C., eldest son of Mr. and Mrs. Arthur H. Seal, of Richmond, Surrey, and Phyllis, elder daughter of the late Mr. J. A. Hill, of Antwicks Manor, Wantage, Berks, and Mrs. A. W. Pratt, of Highbury, Wantage, will take place at St. Peter's Church, Wantage, at 12 on Thursday, October 11th (leave permitting). Owing to the war, there will be no invitations or reception.

THORNE—THURSBY.—The marriage of Lieut. Arthur B. Thorne, R.F.A., attached R.F.C., of Heacham, Norfolk, and Katharine Gwenllian Thursby, of Castle Rising, Norfolk, will take place very shortly at Castle Rising.

Marriages.

BOUMPHREY—GRANDAGE.—On Sept. 6th, at Holy Trinity Church, Sloane Street, S.W., Capt. Geoffrey Maxwell Boumphrey, R.F.C., fifth son of the late Arthur B. Boumphrey and Mrs. Boumphrey, Baycliffe, Lymm, Cheshire, was married to Esther Mary, second daughter of Mr. and Mrs. George Grandage, Byron House, Harrow-on-the-Hill, by the Rev. H. T Robinson, uncle of the bride.

ENGLAND—STANES.—On August 28th, at the Parish Church, Broadstairs, Lieut. Norman Herbert England, R.F.C. (of Sarawak Civil Service), son of Major F. H. England, late Royal Welch Fusiliers, was married to Dorothy Caroline, daughter of the late H. T. Stanes, Esq., Nilgiris, India, and Mrs. Stanes, of Monckton Combe.

LINE—DIMMOCK.—On Sept. 8th, at St. Mary's Church, Wimbledon, Capt. James Line, R.F.C., was married to Dorothy Beatrice Gertrude, second daughter of Lt.-Col. (I.M.S.) and Mrs. H. P. Dimmock, 23, Homefield Road, Wimbledon.

ROWDEN—JOBSON.—The wedding of Capt. C. R. Rowden, M.C., Worcestershire Regt. and R.F.C., son of Mr. Roger Rowden, and Miss Frances Jobson, daughter of Mrs. Howard C. Jobson, of Mill Croft, Rottingdean, Sussex, took place on Sept. 12th at St. Andrew's Church, Ashley Place. Canon Edgar Sheppard, Sub-Dean of the Chapels Royal and Sub-Almoner to the King, performed the rite, and was assisted in the service which was fully choral, by the Rev. W. A. Pearman, uncle of the bridegroom.

TODD—HARDWICK.—On Sept. 13th, at St. Paul's Church, Lincoln, Lieut. A. W. Todd, East Yorks Regt. and R.F.C. younger son of the late W. A. Todd, Esq., and Mrs. W. A. Todd, Newland Park, Hull, was married to Queenie Hardwick only daughter of Engr. Capt., R.N., and Mrs. Hardwick, of 24, Avonmore Road, W. Kensington, by the Rev. John Kaye.

Births.

ALLAN.—On Sept. 11th at Osterley Nursing Home, Isleworth, the wife of Sec. Lt. W. Allan, R.F.C., of a son.

READ.—On Thursday, Sept. 6th, to the wife of Lieut. J. V. Read, R.F.C., 3, Old Coastguards, Charmouth, Dorset, a son.

WOOD.—On Sept. 12th, at "Hele House," Ashburton, Devonshire, to Mildred (née Uniacke), wife of Capt. W. T. Wood, R.F.C.—a daughter.

The following names are from the official list of officers who were lately prisoners in Germany and have been repatriated:—

Brown, Lt. A. W., 3rd Manch. R., attd. R.F.C.
Firstbrook, Lt. J. H., R.F.C.
Frost, Sec. Lt. H. G., 9th Suffolk Regt., attd. R.F.C.
Macaskie, Sec. Lt. D. S. C., R.F.C.
Macfie, Sec. Lt. J. D. A., 9th B. Watch, attd. R.F.C.

* * *

Sec. Lt. Gilbert S. M. Insall, V.C., R.F.C., who was captured by the Germans in January, 1916, has arrived in England, having escaped from Germany.

He won the V.C. in November, 1915, for a daring feat. In a Vickers fighting machine he pursued and attacked a German machine near Achiet. With great skill he manœuvred to close range, and brought the German machine down four miles south of Arras.

* * *

The parents and sister of Sec. Lt. G. A. H. Parkes, R.F.C. of Upper Staplehall, Northfield, Birmingham, reported missing on July 15th, have heard from him that he is wounded in the left arm and a prisoner of war in Germany. He is receiving treatment at a special hospital for arm cases, Reserve Lazaret 3, Johannisthal, Stettin, Deutschland.

* * *

News of Lt. A. J. C. E. Phillipps, R.F.C., whose machine fell near Hollebeke German Lines, June 7th, will be gratefully received by his mother.—All letters should be addressed to Box E.930, "The Times."

* * *

A Reuter report from the British Army Headquarters in France on Sept. 16th, says:—

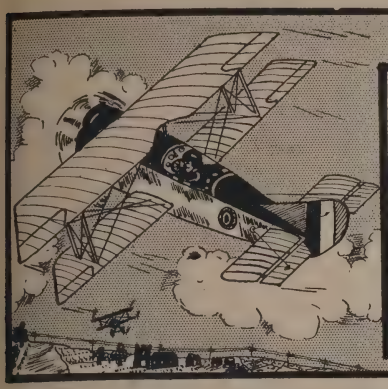
A British county battalion was marching through the main thoroughfare of a certain town in Northern France at the time that a German air raid was in progress. The band continued to play without faltering, and the only departure from strict march discipline which the men committed was to punctuate the crash of each bomb with a round of hilarious cheering. Not a man fell out.

* * *

It is announced that in future commissions for the post of equipment officers in the R.F.C. will not be granted until the candidate has completed a course of training as a cadet.

* * *

On September 11th an aeroplane, with two occupants, nose-dived into Fleet Pond, near Farnborough. Mrs. Mitcham, wife of a sergeant in the Dragoon Guards on active service, swam out 400 yards to the assistance of the aviators, but found that they had escaped in safety.



FRANCE.

Official Communiqués.

Sept. 11th.—Last night German aeroplanes bombarded the region of Dunkirk. Bombs fell on a hospital and about 12 women were wounded.

On Sept. 10th three German aeroplanes were brought down in a fight with our pilots. A fourth enemy machine was destroyed by the fire of our anti-aircraft guns.

Army of the Orient.—On the rest of the front there have been the usual artillery actions. British aeroplanes bombarded successfully enemy camps in the region of Rupel (Struma front).

KINDLY MENTION "THE AEROPLANE" WHEN CORRESPONDING WITH ADVERTISERS.

SEPT. 12th.—Enemy aeroplanes bombed the region of Dunkirk.—There were several victims among the civil population.

During the day yesterday four German aeroplanes were brought down by our pilots, and 10 other enemy machines fell in their own lines badly damaged.

Our bombarding aeroplanes dropped numerous projectiles on the stations of Roulers, Cortemarck, and Staden, the aviation ground at Colmar, the stations of Conflans and Ferny, and some military works to the south-east of Saarburg.

SEPT. 13th.—Last night German aeroplanes dropped bombs in the region of Dunkirk. Our aviators successfully dropped bombs at Hoglet, Cortemarck, Gits, Geite, Lindenken, Staden, and on the aviation grounds north-east of Thourout.

SEPT. 15th.—During the days of the 13th and 14th four German aeroplanes were brought down in aerial fighting.

SEPT. 17th.—In the course of yesterday four German aeroplanes and a kite balloon were brought down by our pilots, and a sixth hostile machine was brought down by our anti-aircraft guns. In addition, six other German aeroplanes were seriously damaged as the result of combats with our aviators and fell within their own lines.

Our bombarding squadrons showed themselves particularly active during yesterday and last night. Many raids were carried out by our machines, which dropped 15,000 kilogrammes (about 15 tons) of bombs on enemy establishments, including the barracks and munition factories at Stuttgart (136 miles east of Nancy), the aerodrome at Colmar (66 miles south-east of Nancy), the store buildings at Logelbach, the military establishments south of Metz, the railway station at Thionville (50 miles north of Nancy), the munition factories at Uckingen (north of Metz), and the railway station of Saarburg (40 miles east of Nancy), etc.

* * *

DONZE—PENNY.—A marriage has been arranged, and will shortly be celebrated, between Brigadier-Pilote Robert Louis Donzé, Escadrille N.93, French Aviation Corps, youngest son of Mr. and Mrs. Eugène Donzé, of Santa Barbara, California, U.S.A., and Gladys Isabel Mackenzie Penny, only daughter of the late Don Mariano and of the late Mrs. Mackenzie Penny, of Aberdeenshire, Scotland.

GERMANY.

OFFICIAL COMMUNIQUÉS.

SEPT. 11th.—Yesterday Lieut. Voss shot down three enemy aviators. He has thereby increased the number of his aerial victims to 45.

SEPT. 12th.—Nineteen enemy aviators have been brought down. One of them was brought down by Lt. Voss (46th aerial victory).

SEPT. 13th.—Lieut. Voss shot down his 47th adversary in aerial battle.

SEPT. 15th.—Lieut. von Bülow brought down his 20th adversary in aerial battle.

SEPT. 17th.—Two aeroplanes were shot down by one of our pursuing squadrons out of enemy aerial squadrons which bombarded Colmar (40 miles south-south-west of Strassburg) twice yesterday (Monday). In addition to this the enemy lost 16 aeroplanes.

Ober Lieut. Berthold brought down two enemy aviators in aerial combat on Sept. 15th, and Ober Lieut. Schleich has brought down three opponents in aerial battle during the last two days.

* * *

A report from Amsterdam, dated Sept. 13th, states that Lieut. Hohendorf, one of Germany's best fliers, was shot down by British aviators in France last week. He was a celebrated pilot in peace time.

The career of Lieut. Hohendorf, as far as the German official reports record it, closed apparently at the end of July, 1916. He was then credited with having brought down his eleventh aeroplane. It may be surmised that he had been temporarily put out of action by a French or British aviator until his reappearance last week.

He was, at any rate, a man of large enterprise. It is related by the "Guerre Aérienne" that in 1913 Hohendorf presented himself as a pupil at a flying school in France, stating that he was from Switzerland. He made remarkable progress as a flier, and apparently more as a spy. He was discovered by two workmen in the act of taking accurate measurements of the internal parts of a machine and recording them in a notebook. When asked to give an account of his actions, he denied everything. The notebook was taken from his pocket, and confronted with that evidence of espionage he stood confounded. Unfortunately, while the workmen were communicating with the authorities, Hohendorf found an opportunity to escape and disappeared.

Lieut. Hohendorf received the Order Pour le Mérite in July, 1916.

RUSSIA.

OFFICIAL COMMUNIQUÉS.

SEPT. 11th.—A squadron of our aeroplanes, consisting of five machines, bombarded enemy depots and hutments in the region of Doubrowa, to the south-east of Kovel. Ten poods of bombs were dropped. In the same region the airship (?) Ilia Mourmetz dropped bombs on enemy convoys and batteries.

On the Rumanian front four aerial combats took place on Sept. 9th as a result of which four enemy aeroplanes were forced to descend in their own lines.

Enemy aeroplanes dropped bombs on the stations of Zamir (Minsk-Baranovitchi sector) and Radziviloff (near the Galician frontier).

SEPT. 13th.—In aerial engagements in the region of Husiatyn and Skala our aviators forced two enemy machines to descend precipitately. Our aeroplanes dropped bombs on various enemy positions. Five poods (about 180 lb.) of bombs were dropped on the small town of Krivoshin (to the south of Baranowitschi) while eight poods (about 290 lb.) were dropped in the Kovel region.

SEPT. 15th.—On September 13th a series of aerial engagements took place, Capt. Kazakoff brought down his 17th enemy aeroplane in the region of Husiatyn. The enemy aviators were taken prisoners.

AUSTRIA.

OFFICIAL COMMUNIQUÉ.

SEPT. 13th.—Aviators bombed Jojani, killing several inhabitants.

ITALY.

OFFICIAL COMMUNIQUÉS.

SEPT. 13th.—An enemy aeroplane brought down by our anti-aircraft fire fell in the neighbourhood of Duino (Gulf of Trieste).

SEPT. 15th.—On the Carso the enemy's lines of communication were bombarded by our aviators with about three tons of bombs.

During an aerial combat an enemy aeroplane was brought down in flames and fell in the Auzza Torrent (Avscek). The pilot were killed.

SEPT. 16th.—Troops massed in the Ravnica area (east of M. S. Gabriele) were bombarded with about two and a half tons of bombs by two of our air squadrons.

* * *

A report from Washington states that Capt. Riznati, of the Italian Army, made a flight lasting six hours over Virginia on September 13th. He used a Caproni machine and carried six passengers. The flight was successfully accomplished in the teeth of a gale.

* * *

It is reported that on September 6th, behind San Gabriele Capt. Baracca had his nineteenth victory, and on the 14th Comdr. Piccio brought down in flames his eleventh enemy machine.

TURKEY.

OFFICIAL COMMUNIQUÉS.

SEPT. 10th.—SINAI FRONT.—The aerial activity of the enemy has decreased on this front.

Our seaplanes successfully dropped bombs on the enemy hangars at Mudros. In spite of violent artillery fire our machines returned safely.

SEPT. 12th.—On the Sinai front an enemy aviator was forced by our artillery fire to land behind his own lines.

SEPT. 14th.—Hostile aeroplanes attacked Smyrna, two persons being wounded and four private houses and shops destroyed.

BELGIUM.

OFFICIAL COMMUNIQUÉS.

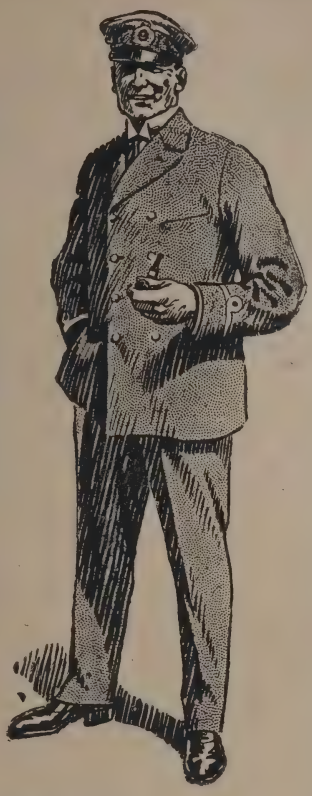
SEPT. 11th.—Our aviators have made 75 flights during the past two days, have taken numerous photographs, and directed the fire of our guns, and have engaged in several fights. Further, an enemy machine was shot down this morning within our lines, and a second machine was brought down within the enemy's lines in the direction of Schoorbakke.

SEPT. 13th.—During the night of Sept. 12th-13th several of our cantonments were bombed by enemy aviators.

* * *

A Belgian official telegram received from Havre on Sept. 14th narrates an incident on the Belgian front some time ago which illustrates in a striking fashion the close solidarity and the friendly feelings existing among the soldiers of the Allied Armies. One afternoon the Belgian soldiers witnessed from the trenches along the Nieuport-Dixmude railway an aerial fight during which a British aeroplane, surrounded by five Germans, was brought down in No Man's Land. It fell about 150 yards from the Belgian and German lines east of Ramscapelle, and the enemy opened fire on it as soon as it reached the ground.

With the hope of bringing help to their Allies, a few Belgian soldiers, led by Sergeant Bernimolin, volunteered to leave their trenches under a very violent fire. Crawling in the mud, they succeeded in reaching the machine, only to find the British aviators already dead, and brought back the body of one of them.



Some hours later, as soon as the enemy's fire relaxed, the Belgians went back to the machine and found a party of Germans engaged in despoiling the corpse of the second aviator. They put the enemy to flight, and, in spite of a violent fire directed against them by the Germans, who were furious at being deprived of their loot, carried the second body back to their lines. A few hours later a third party went back in order to set fire to the wrecked machine, so that no fragment of it should fall into German hands.

HOLLAND.

A message from Ymuiden, of recent date, gives some details regarding a Zeppelin attack on Sept. 10th on the Swedish steamer, "Flandria," supplied by passengers, who state that the first bomb which was dropped narrowly missed the ship. The engines were stopped. Four more bombs were, however, dropped dangerously near the vessel. Before all those on board had entered the boats, there was a panic, and the captain had to use his revolver several times. The ship's company, after remaining for a couple of hours in the boats, returned to the "Flandria." At six o'clock in the evening another airship appeared and hovered above the ship for a time, but departed without doing harm.

DENMARK.

A message from Copenhagen, dated Sept. 16th, states that a German aeroplane, marked "No. 6," left Hamburg on September 4th for Warnemünde (Germany). It has now been found in a damaged condition in the Baltic, not far from the Danish port of Langeland. The aviators were missing.

INDIA.

From the "Daily Express" of Sept. 13th :—

"Bengal and Sind are engaged in a friendly rivalry just now in the organisation of flying corps. The Bengalis are purchasing 12 aeroplanes and enrolling pilots, observers, and mechanics, while the Karachi scheme includes a large aerodrome, flying school, and workshops as the nucleus of an Indian aerial base."

[Seeing that there are no native artillery batteries, it seems somewhat peculiar that there should be native pilots and observers.—Ed.]

THE DEVELOPMENT OF AIR WAR.

A special correspondent of the "Morning Post" writing from the British Front of the raids made by the British upon the German trenches, on Sept. 17th, says :—

Meanwhile large numbers of aeroplanes were raiding and bombing various aerodromes' depots behind the German lines, in the daylight as well as the darkness, and attacking the troops with machine-guns. Yesterday morning some of our airmen sighted some two thousand German infantry marching on the Menin-Mouscron road, with the tail of the column just leaving Mouscron. Our aeroplanes dropped to 200ft. and dispersed the troops in confusion, with many casualties.

Our airmen have been very active, despite the unfavourable weather. A thick mist and high winds have been responsible for many comparatively blank days, but even the worst conditions for flying have not caused an absolute suspension of the bombing raids and air fighting. Enemy bases are pounded continually and accurately. Hardly a night passes without great fleets of bombing machines passing safely above the German lines in Flanders and Northern France and unloading tons of explosives many miles behind them. The effect of these successful raids is to keep certain German aerodromes in a state of semi-destruction and to wear down the nerves of their staffs by not giving them an opportunity to repair the damage done by one raid before another is made.

[One hopes that particular attention is being paid to the aerodromes in Flanders whence the raids on England start, and where the raiding machines are assembled.—Ed.]

Our bombers are more accurate than ever. Direct hits on aeroplane sheds are of nightly occurrence, and others are made on railway stations, rolling stock, munition factories, balloon winches, land searchlights, torpedo-boats, waggon transport, and ammunition dumps. The German airman invariably follow British policy. They never dared to attack infantry with machine-guns until our men had broken many of their columns on the march and relief detachments on the battlefield, and cleared trenches of their occupants by diving so close that their wings nearly brushed the parapet. They did not attempt daylight bombing until the success of many such British raids forced the German Air Department to insist on similar tactics by their fliers. We were the first to make long-distance raids on a large scale, the first to subject hostile aerodromes to continued bombing night after night, and the first to adopt large formations for reconnaissance.

[But is it a fact that the Germans now carry on their bombing raids on a bigger scale owing to their having more machines?—Ed.]

Much has been heard of the Gotha Type of German aeroplane. For the moment it appears to occupy the same position in the public mind as did the so-called "Taubes" at the beginning of the war and the over-advertised Fokker some months later. The Gotha, which is devoted to bombing, is easily outclassed by British machines engaged in the same work. Larger and more powerful raiders than the Gotha are working in the enemy's back areas every night.

[Quite so, but do we use as many of them as the Germans do?—Ed.].

LORD NORTHCLIFFE AND THE AMERICAN AIRCRAFT INDUSTRY.

The following is from an article by Lord Northcliffe, published in the Philadelphia "Public Ledger" of Sept. 18th :—

The enthusiastic outpourings of air amateurs and their cries of "One hundred thousand aeroplanes" have made a good many people sceptical as to American participation in the air fighting. But behind all that talk is already a vast accomplishment. The solid foundation has been laid of an air service backed by practically illimitable man-power and machine-power. Its fruits will be shown as suddenly as came conscription. The movement is going on as rapidly as possible having regard to the thoroughness with which everything is being done. There has been a complete *liaison* with the air services of France and England. The models of the latest French and English machines are here. While no time has been lost, most careful consideration has been given to a definite plan of campaign.

I wish I could say as much with regard to the speed of American shipbuilding. I have already expressed my opinion, which is shared by many people here, that so long as the Allied Governments hide the truth as to the real nature of the submarine danger the burning enthusiasm which Americans are putting into their air service will be lacking in the American shipyards.

This, however, is the only direction, so far as I have been able to judge, in which more might be done than is being done at present.

AVIATORS AND THE LAW.

Sqdn. Comdr. F. E. T. Hewlett, R.N., of the Air Board Office, was fined 35s. on Sept. 13th at West London Police Court for exceeding the speed limit with a motor-car. His licence was ordered to be endorsed. The case had been adjourned from the week before for the production of the licence, Comdr. Hewlett writing that he was too busy to attend the Court.

Among the motorists dealt with at Kingston on Sept. 13th for exceeding the speed limit was Capt. Stanley Graham Gilmour, R.F.C., who was fined £10, his pace on the Portsmouth Road at Thames Ditton being given by the police as over 33 miles an hour on a Sunday afternoon.

A similar fine for a like offence was imposed on Francis Gilmour Tempest Dawson, of the Summer House, Hamble, against whom seven previous convictions were proved. His pace at Kingston Vale on a Sunday evening was given as over 28 miles an hour.

[It would seem that the police, instructed by the prejudiced old fossils who maladministrate the laws of the land, are making a dead set against the few motorists left on the road, irrespective of whether they are driving on the nation's business or not. The idea of an officer and an ex-officer being fined £10 for a paltry 33 and 28 miles an hour on a free and open road probably appeals to a crowd of shop keepers who do nothing to help in the war, and the action provides an excellent example of what we may expect under a democratic government.—Ed.]

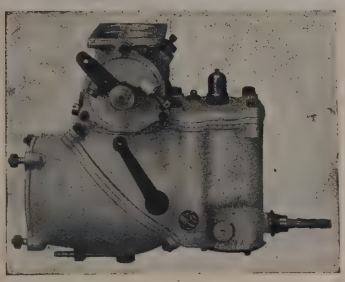
A SERIOUS CASE.

At Southwark on Sept 13th, Mr. Walter Schroder held an inquest on the body of Nellie Wheeler, aged seven, daughter of a driver in the Transport Service, of Empress Street, Walworth Road, who was killed on Sunday afternoon by a motor lorry alleged to have been driven by 1st Air Mechanic H. Robinson, who has been remanded on a charge of manslaughter.

Lieut. Beresford, R.F.C., said that, in view of the serious position of the driver, he would watch the proceedings on his behalf.

Nellie Wheeler, mother of the child, said that at 4 o'clock on Sunday afternoon she was standing at her street door when she saw a motor-lorry come round the corner at great speed. The lorry mounted the kerb on the opposite side of the road and came across the street, mounted the pavement, and dashed into the witness's house. It pinned three adults and two children against the wall. The witness ran away, but hearing screams, returned to the door and saw her daughter lying dead.

Joseph Roddis, the child's grandfather, declared that the motor came round the corner at 16 or 17 miles an hour, "like lightning." The witness told the driver that he ought to be ashamed of himself for coming round the corner as he did, and the driver replied, "Make it as light as you can for me."



Lieut. Beresford was putting some questions when the witness exclaimed, "I say it was a joy ride. The lorry had been round the houses three or four times, once with children in it." He admitted that the driver was "a bit shaky and upset" after the accident. The inquiry was adjourned.

WHAT, WHO, WHERE, AND WHY?

From the "Daily Mail" of Sept. 18th :—

A number of valuable plans of aeroplanes, which mysteriously disappeared a few days ago, were recovered in London yesterday in a remarkable manner.

The plans were stolen from the offices of H. Alexander and Co., aeroplane manufacturers, Charing Cross Road, and as they were of considerable importance New Scotland Yard detectives were

informed of the loss. They made careful inquiries in many directions but nothing resulted until yesterday, when Divisional Detective-Inspector Mercer and Sergeant Miles went to the cloak-room of Piccadilly Circus Tube Station, where, after a prolonged search, they found an unaddressed parcel fastened with green seals. On opening the parcel the detectives found the plans.

Later the detectives arrested a Greek named Faedo Cokinaki, whom they met in Elgin Avenue, Maida Vale, and conveyed to Bow Street Police Station, where he was charged.

[Alexander the Great (Conqueror) we know, Alexander the Great (Tailor) we know, but who is Alexander the great aeroplane designer? It is interesting that plans of such importance should be produced by a firm unknown to the majority of people in the Aircraft Industry.—Ed.]

TYPES OF BRITISH AIRCRAFT.

Brown, Bros., Ltd., of Great Eastern Street, London, E.C., have issued an interesting souvenir in the shape of a portfolio of pictures of "Types of British Aircraft," which consists of sixteen plate-sunk sketches on art paper, by Mr. Geoffrey Watson, illustrating well-known modern British aeroplanes.

Readers of The Aeroplane, who would like to have a free copy of the portfolio, are invited to send two stamps to Brown Bros., Ltd., for postage.

R.F.C. CRICKET.

From the "Morning Post":—

Unable to place a representative side in the field at Mitcham on Sept. 12th, the Public Schools lost by 56 runs to the Royal Flying Corps (Farnborough), who have gone through the season unbeaten. Still, the boys, whose eleven included only two regular bowlers—Stevens, of U.C.S., and Calder, of Cranleigh—made a creditable fight against their formidable opponents, of whom five were first-class county players. Bowling unchanged, Stevens took six wickets for 59 runs and Calder four for 40. The fielding was excellent, and Cuthbertson, Williams, and Hilder all brought off brilliant catches. For the R.F.C., Makepeace (Lancashire) batted skilfully for more than an hour, failing to a catch of exceptional merit. Horsley (Derbyshire) obtained five wickets for 12 runs and Harrison (Sussex) three wickets for 11 runs.

AN ANNUAL OUTING.

The employees of the aero department of Thompson Bros. (Bilston), Ltd., held their annual outing on Saturday last, the 15th inst., journeying in chars-a-bancs to the ancient village of Tong, Shropshire, some 15 miles distant, which is noted for its Castle and Church, the latter dating from the year 1100. After viewing the sights, tea was taken at the Bell Inn, at the conclusion of which Mr. H. J. Thompson spoke a few words of the progress of this department and of the good feelings which exist between the workers and the firm. Mr. Meredith (Works Manager) also spoke thanking the workers for their assistance in helping to attain the present state of efficiency.

THE SOPWITH WORKS SPORTS.

On Saturday, Sept. 15th, the Sopwith Aviation Co., Ltd., held their annual sports on the Old Kingstonian's football ground, all the takings being handed over to the Flying Services' Fund.

An extremely good entry was obtained, and a large crowd collected to view the sports, the number of persons being variously estimated at 3,000 and 5,000. The programme was very lengthy, and, unfortunately, several events had to be postponed, but those which took place were very satisfactory, the results being as follows:—

100 yds. Works' Championship (ladies)—Miss Cremer 1, Miss Moatt 2, Miss L. Hooper 3.

350 yds. Scratch Race (boys)—W. Arnold 1, E. Murray 2, A. Little 3; 2 yds., yd.; 51 2/5 sec.

Apple Bobbing—F. Gough 1, E. Roach 2, A. Little 3.

440 yds. Works' Championship, for the "Aeroplane" Cup.—A. Whitehorn 1, W. Brider 2, F. Driver 3; 3 yds., yd.; 56 1/5 sec.

Tug-of-War (munition workers)—Sopwith beat Napier by 2 pulls to 0.

100 yds. Handicap (munition workers)—H. A. Baker, R.A.F., 10½ yds., 1; J. M. Hicks, Finchley, H., 7½, 2; W. Pendlebury, R.A.F., 8, 3; 2 yds., ½ yd.; 10 sec.

100 yds. Invitation Handicap—H. R. Wicks, R.N.A.S., 4 yds., 1; Sgt.-Maj. Mawby, R.F.C., scr., 2; Air Mech. P. G. N. Baker, R.F.C., 4, 3; 1½ yds., 2½; 10 1/5 sec.

Mile Works' Walking Championship—A. W. Marder 1, E. Pettman 2, S. Spriggs 3; 90 yds., 70 yds.; 8 min. 55 sec.

100 yds. (boys)—W. Arnold 1, A. Gough 2, O. Pizzy 3; yd., yd.

100 yds. (veterans)—L. T. Smith, 4 yds., 1; T. Weller, 16, 2; J. Rimmer, 8, 3; yd., ft.

Wrestling Match (catch-as-catch-can)—F. W. Knight (amateur bantam champion, 1908 and 1911) beat G. Appleton, Sopwith A.C., by 2 falls to 1.

Mile Works' Championship—A. Bale 1, J. W. Wilson 2, A. C. Mayell 3; 30 yds., 5 yds.; 5 min. 10½ sec.

100 yds. Works' Championship—V. W. Derrington, J. Whitehorn, J. Grant 3; 10 4/5 sec.

440 yds. Handicap (munition workers)—M. J. Kehoe, Arc Works A.C., 24 yds., 1; F. R. Manton, Beck United A.C., 26, 2; G. P. Sweet, Surrey A.C., 14, 3; 4½ yds., 1½ yds.; 50 sec.

Mile Open Relay Race (880, 440, 220, and 220 yds.)—Vickers, Crayford, A.C. (P. Hodge, H. Smith, H. Hutchinson, F. Badcock), 1; Vickers, Erith (O. C. Currall, G. Henstridge, W. Kemp, A. Ashfield), 2; Napier's, 3; 5 yds., 7 yds.; 3 min. 58 2/5 sec.

Mile Open Handicap—A. H. Nichols, S.A.C., scr., 1; F. Maxim, Finchley H., 118 yds., 2; J. H. Hook, Finchley H., 175, 3; ins., 5 yds.; 4 min. 29 4/5 sec.

Music was supplied by the Sopwith Orchestra and dancing was indulged in at the conclusion of the sports, several hundreds of persons taking part. The success of the function is a tribute to the efficiency of those who took part in its organisation, and one looks forward to a still larger entry for the next annual sports of this pioneer firm.

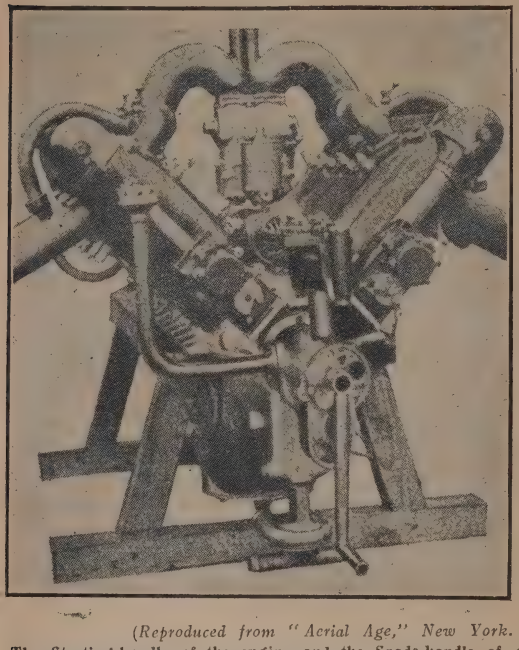
ON THE COMFORT AND SAFETY OF PILOTS.

Gun Positions.

There is another point in design on which those responsible might well keep an eye. It may be noticed that in nearly all German aeroplanes the forward machine-gun is placed to one side of the cockpit, instead of directly in front of the pilot's face. This is necessary in German aeroplanes, because the big vertical cylinders make it impossible to place the machine-gun in the centre of the cowl.

Apart from that, however, there is a very real advantage in having the gun elsewhere than directly central, where, as a fighting pilot puts it, the gun is "just in front of the pilot's nose—presumably as a warning not to crash." With the spade-handle of a fixed gun projecting backwards into the "boudoir," if the pilot does crash, he is practically bound to fall face first into the gun.

A young friend of mine completely ruined the sight of one eye in precisely this way some months ago, in a smash which otherwise would not have hurt him at all. He was flying a very fast scout with an experimental engine at an aerodrome which has a high broad bank along one side. While he was over the wrong side of the bank, his engine petered out and he started to glide for home, as there was no possible landing place under him. With great skill and judgment he just managed to reach the bank by practically stalling the machine onto the top of it. The machine trickled gently across the top of the bank, just got its nose over the far edge, and stood quietly on its head in the aerodrome at the bottom.



The Machine-gun alongside the Mercédès Engine on an Albatros. Albatros.

The pilot climbed out and stood beside the machine, apparently unhurt; but when the mechanics reached him, they found him nursing one eye, and he explained that, although he had not been pitched hard into the front of the machine, his head had just bobbed forward, so that one eye caught the corner of a padded board which had been placed across the double handles of the gun, with the laudable intention of saving the pilot's face. The corner of the buffer-board had pushed a hole in his Triplex goggles—which, be it said, were not splintered—and had smashed one of his own glasses into his eye, cutting certain very necessary eye muscles.

I doubt whether he would have got off much better if he had not been wearing glasses under his goggles, for the corner of the board went clear through the goggles, and would probably have forced itself or the torn Triplex stuff into his eye in any case; but it is perfectly certain that, if he had had ordinary glass goggles instead of Triplex, he would have had his eye gouged clean out. It is not my habit to give testimonials in these columns, but in this case such testimony is thoroughly well deserved.

Anyhow, there are plenty of better places for gun-butts than right in front of the pilot's nose, and, though it may be worth while to put the gun in the centre if one is going to fire through the cam-shaft of a V-type engine, it does not matter much where else one puts the gun with any other type of engine in these days of interrupter gears and indirect sights and such refine-

(Reproduced from "Aerial Age," New York.
The Starting-handle of the engine and the Spade-handle of a Lewis Gun fitted in the V of a Hispano-Suiza Engine.

ments. With twin guns, of course, the question of central gun-fittings does not arise.

Night Landings.

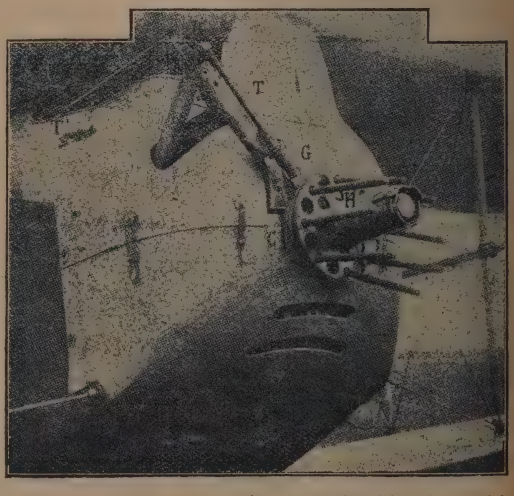
One of the worst dangers of aviators in these days, or rather nights, of nocturnal raids, as in the Zeppelin period, and with the remarkable increase in night fighting at the front, is landing in the dark. In clear weather, landing with the improved types of lights now used is fairly simple, at home anyhow. Abroad it is rather another matter, for I gather that the wily Hun has a nasty habit of sending over a number of bombing machines in company with our returning bombers—at a respectful distance above them—and then, when the landing lights are switched on, down comes a shower of bombs on the aerodrome.

The results of these return-raids have not been great, it seems; but they are distinctly annoying, and they have, at any rate, the effect of putting out the landing lights for the time being, and compelling our people to flop round in the dark, or chance landing without lights.

There seems room, therefore, for some ingenious individual to perfect a really sound method of indicating to a pilot precisely how far he is above the nearest ground. The aneroid is no use, because it only shows height above sea level, or the original starting place. There is the classic instance of the pilot who started from the Thames Valley to strafe Zeppelins, and who, after flying all over the country for hours, decided to look for a landing somewhere. He descended boldly to 1,100 feet, by aneroid, and then edged gingerly down to 1,000 feet. There he began to look over the side, expecting to see a light of some sort or other when so low. Suddenly he landed with a crash and deleted his under-carriage quite successfully on a grass field without hurting himself. When he came to investigate, he found that he had just happened to hit off the top of Leith Hill, which is about the only ground above 500 feet high for a hundred miles or so.

There is also the case of the late Mr. Jacob Delaval Astley, more commonly known as "Otto." He started from Hendon in the "Circuit of Britain" on a Birdling monoplane, and flew into a fog. He kept steadily at 300 feet, flying due north by compass, and in something less than an hour found himself rolling smoothly along a perfect grass field near Bedford, where the ground rises to just the necessary 300 feet. Doubtless there are many similar cases, besides many more in which the pilots have been less fortunate.

One Way of Doing It.



Some considerable time before the war a certain aeroplane maker named Pemberton-Billing, of Southampton, devised what he called a "super-meter," which was a plumb-line let out of the machine when the pilot thought he was near the ground, or the water, in darkness or fog. When the plumb-bob touched anything, land, water, trees, houses, or such things, the line rang a bell, or lit up an electric lamp, or played a tune, or did something diverting to attract the pilot's attention and warn him to switch off and land.

The idea was quite sound then, and seems more so still to-day. There are several ways of making the device work successfully, and it now seems well worth reviving, both for use at sea over perfectly calm water when one cannot see the surface in daylight, and over land or water in the dark. If anyone can think of a better way, it is well worth their while to go on experimenting till they have perfected the idea.

If a way can be devised of telling the height of a machine above the ground without a trailing line, so much the better, for if the line catches a tree or a house-top it gives its warning just as if it had touched open grass, and so may be dangerously deceptive. On clear nights a machine can drop flares to show what is below it, or use other means such as those now in use which must not be described, but in fog no sort of light is of any use, so there is an opportunity here for some inventive genius to assist the mental comfort of pilots.

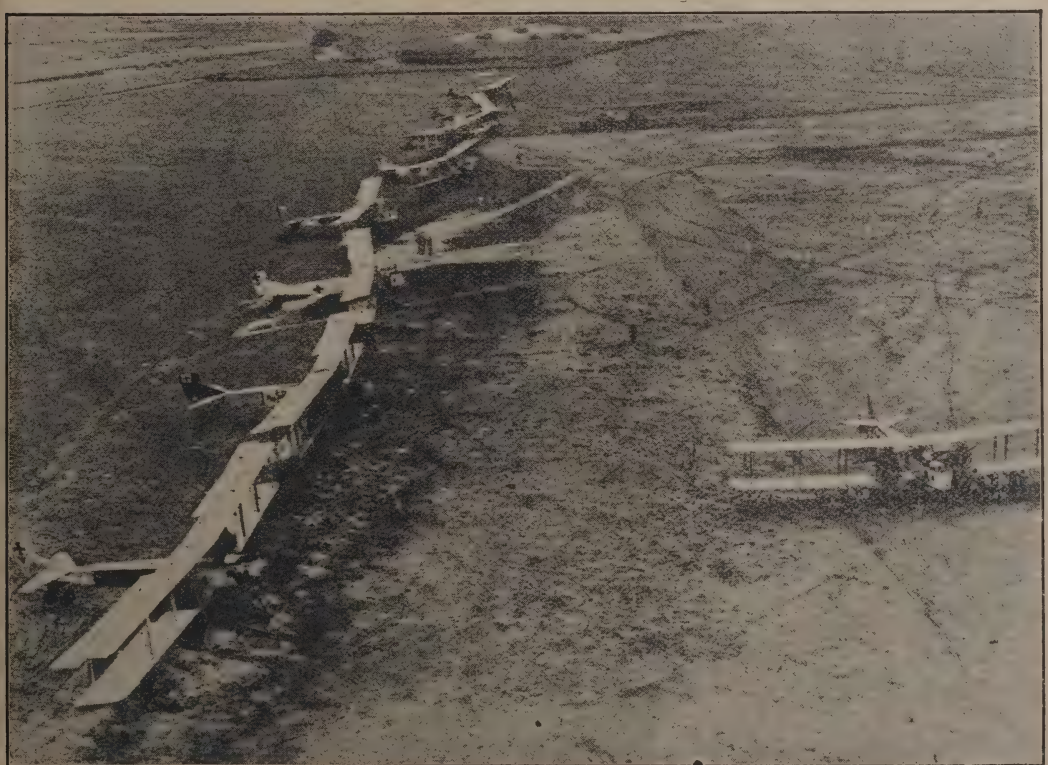
Seeing in the Dark.

Various papers, commenting on recent aeroplane raids by night, have referred to the difficulty of seeing aeroplanes in the dark, either from the ground or when in the air. One recalls that in the early days of Zeppelin raids, when Paris was supposed to be defended by night patrols of aeroplanes, the said aeroplanes carried searchlights with which they were supposed to pick out the whereabouts of the invaders. It was pointed out in

The Nose of an Albatros, showing the synchronising Gear which fires the machine-gun.

this paper at the time that these searchlights served equally well to show the invaders the whereabouts of the patrols, so that they could be avoided.

This objection is still more true in the case of the swifter and more quickly manœuvred raiding aeroplanes. Moreover, dispatches from G.H.Q. in France have described how our fighting machines, accompanying bombers at night, have dived at the enemy's searchlights on the ground, and have pumped bullets into them till they have gone out, whether because they have hit the light or because they have worried the crew into switching off is not clear.



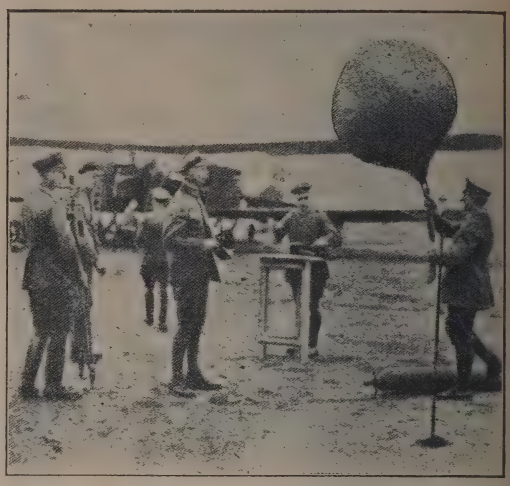
When one remembers the blinding glare of a searchlight, it seems unlikely that the gunners on the aeroplanes were able to fire direct into the face of the light itself, but they may have fired at the base of the beam without actually flying into the beam itself. But, in any case, if it is possible to put out a searchlight on the ground by firing into it, there seems something like an equal chance of hitting an aeroplane which is carrying a searchlight—at any rate, if the light is kept going for more than a few seconds at a time.

An Opportunity for Inventors.

Very possibly some means, unknown to the omniscient Press, has already been found of spotting enemy aeroplanes in the dark. If so, we shall doubtless see the result whenever the enemy attempts that really big raid about which he has

Loading up a Gotha Raider before starting.

A Gotha Raiding Squadron Starting. The smooth starting place is of interest.



been talking so much since the "trial trips" of the last few months. That is, of course, assuming that the continual raids by the R.N.A.S. on his aerodromes in Flanders fail to prevent him from assembling enough machines at once to make up his raiding fleet to the desired strength. At present he seems to have considerable difficulty in replacing the machines smashed in their own aerodromes by the R.N.A.S. bombs, but it is just as well to be properly prepared.

Also, it is difficult to have too much of a good thing, so even if we have an officially approved method of spotting invaders at night, it may be well to have an alternative method. Therefore, if any of our thousands of brilliant inventors have ideas on the subject, they may as well go ahead with their development, and send them along when they feel sure they will work. It may be well to remind inventors that anything in the way of lights thrown on raiders from above will illuminate the ground below, and will help the enemy in the accuracy of their bomb-dropping, so parachute flares dropped from high-flying aeroplanes can be washed out for a start.

Life-Saving Parachutes.

Talking of parachutes, it occurs to me that we have now reached the stage when parachutes might well be used as life-buoys on aeroplanes. Everyone knows how successful they have been in saving the lives of observers in kite-balloons when set on fire by enemy aeroplanes. Hitherto, however, they have had little chance of usefulness on aeroplanes.

In the early days, if an aeroplane got out of control at a height of 2,000, or 3,000, or even 5,000 feet, either through breakage or through being shot about by the enemy, the pilot probably wrestled with it in the hope of regaining control till so near the ground that it would have been too late to jump out with a parachute. Also,

Sending up a Test Balloon to find the true direction of the Upper Wind before starting a Gotha Raid.

the old, heavy, voluminous parachutes, with their tangle of cords and fabric, were so unreliable in opening when released in a bundle, and not slung by the centre and left hanging straight down below a balloon like a closed umbrella, that the risk of taking to a parachute was probably greater than the risk of sticking to the machine.

Now, however, circumstances have altered considerably. Machines are shot down at anything between 10,000 and 20,000 feet. In such a case a pilot has a matter of minutes in which to make up his mind whether the machine is going to come under control again or

The Pilot and Observers of a Raiding Gotha dressing before going aloft for a Raid. The Photographs are reproduced from a Hamburg paper.

not. Furthermore, the modern parachute, say, of the Calthrop type, is so much more compact that it can be carried on an aeroplane with ease, and is so much more certain of opening that it really has become a reasonable proposition as a life-saver.

It is now a good many years since the gallant little Pégoud demonstrated that it was possible to jump from an aeroplane with a parachute and live. Naturally there is a big difference between quitting the slow old Blériot of the period and getting out of a high-speed modern machine in the process of an uncontrollable spin.

Still, the mere speed of the machine should make the parachute open all the more quickly, provided that the parachute could be thrown up into the air behind the machine, and that the pilot was not expected to fall away below the machine and drag the parachute out of its pocket with his weight, as he does when quitting a balloon.

A case where a parachute would almost certainly have saved the pilot was that of the late Captain Cole-Hamilton, who, according to fairly reliable witnesses, manœuvred down with a partially broken wing for several thousands of feet before the wing finally gave way and made the machine utterly uncontrollable. Also in cases of fire, such as those already quoted in reference to petrol-release gadgets, parachutes thrown well up behind the machines might have saved the pilots and passengers.

Parachute Storage.

This method would not, I fear, apply in the case of "pusher" machines, but there seems to be no great difficulty in applying it to tractors. Also, the streamline fairing on top of the fuselage proper, and raised up behind the pilot's head, would provide a nice neat locker in which to store the parachute in a single-seater. In a two seater this space would take the passenger's parachute, and the pilot's would either go into the space between the two cockpits or perhaps into a hole in the upper plane. The storage space for the parachutes is, however, a matter which might well be left to the ingenuity of the aeroplane designer. Cases would, no doubt, occur in which the parachute in opening might become tangled in broken pieces of the machine, or in which the parachute itself might be set on fire, but even so it would never increase the pilot's risk, so far as I can see, and it would almost certainly save a number of lives.

I do not know what devices the ingenious Mr. Calthrop has produced for launching parachutes clear of aeroplanes, as opposed to merely dropping them from balloons or airships, but the problem does not seem difficult to solve. One young R.F.C. officer (invalided out), whose name I have unfortunately forgotten at the moment, showed me some months ago quite a reasonable method of launching a parachute from an aeroplane. If he happens to read these notes, I shall be glad to hear from him how his experiments are progressing.

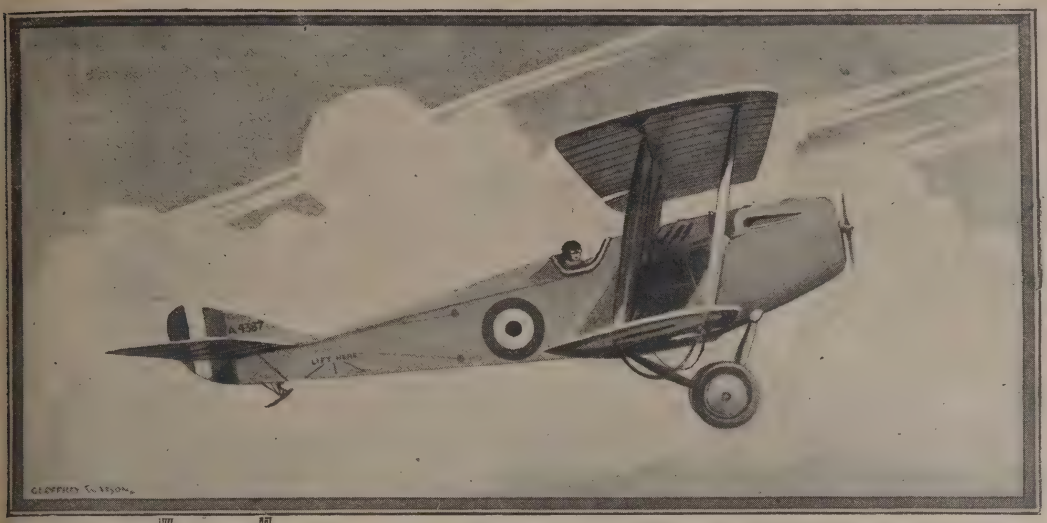
In any case, I commend to the High Authorities the consideration of these suggestions. If it were practicable to use parachutes as emergency exits from damaged aeroplanes, and to carry them so that they would not interfere with the aeroplanes' performances, it seems that they would afford considerable mental comfort to pilots, and might save quite a reasonable number of lives. Many of them might never be used at all—and so much the better—but, in time of peace, anyhow, one does not expect every life-buoy on board ship to save a life, so, on similar lines, it would be enough if the parachute, like the policeman, could adopt the motto, "I'm there if I'm wanted."

All these points may seem trivial in themselves to people who think of pilots and aeroplanes by the hundred of thousands, and who picture to themselves vast fleets of aeroplanes darkening the sky of Germany, but in the end it is the pilot who counts for most, and, if one can save the lives of a few pilots and give them more comfort during their flying lives, it certainly seems worth doing.—C. G. G.

ON THE BEGINNING OF THE RAIDING SEASON

The German is really a very simple-minded person. So much so in fact that he frequently takes one by surprise by doing things that are so obvious as to seem hardly worth doing. Take Monday night's performance as an example. The moon, which was about a half-moon, was due to set at about 9.30 p.m., so the raiding Huns appeared just before nine, on about the first clear, calm night for the last six weeks. Obviously it was the right thing to do, because the return journey would be in darkness, so that they could not easily be caught and headed off from home by the Allied aviators at Dunkirk.

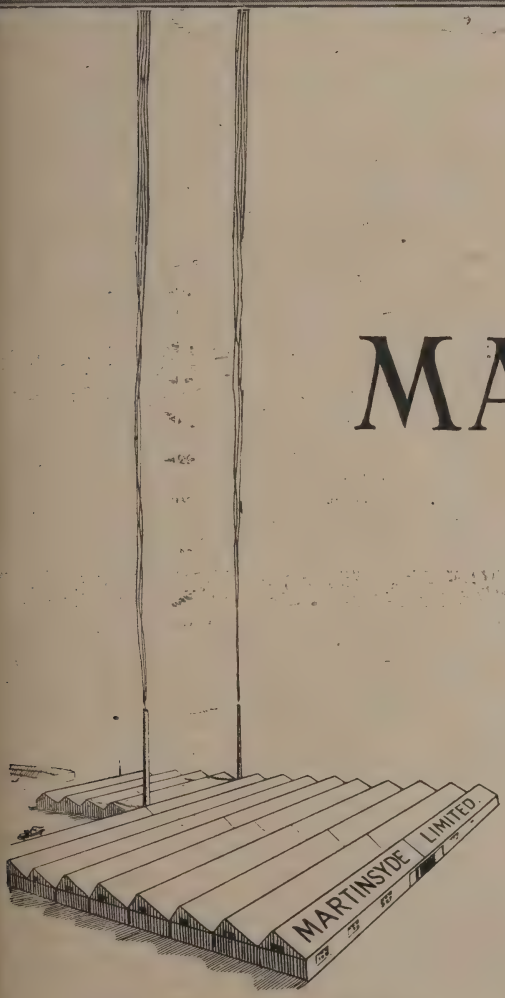
They must have left Belgium pretty well in daylight, but, at the moment of writing, it is not known whether any of them were caught and brought down by the R.N.A.S. people on the outward journey. The patrol of the short strip of coast from Dunkirk to Flushing would be, naturally, the chief duty of the R.N.A.S. fighting machines, just as the bombing of German aerodromes in Belgium whence these raiders start would be the chief duty of the R.N.A.S. bombing machines in Flanders.



Such duties are an integral part of the defence of London, and if those forces, being on the wrong side of the Channel, cannot be directly under the command of the G.O.C. London defences, they would obviously be in the closest touch with him and his staff. For the matter of that there would be nothing more incongruous in putting them under a General Officer who is at least intimately concerned with aerial defence work than in putting them under the Admiral commanding Dover patrol, consisting as it does of ships which have little or no interest in aircraft.

At any rate, so far as the defences of London itself are concerned, they are in excellent hands, and one may rest assured that all is being done that can be done to deal as effectually with night air raids as our aviators dealt with Zeppelin raids of last year. There are certain inherent difficulties in connection with night fighting which may at first be difficult to overcome, but they will be overcome in time just as the Zeppelin nuisance was overcome.

Zeppelins.



Zeppelins, it may now be noted, are only used for sea work, and for attacks on minor cities which the invaders have reason to believe are not heavily defended by guns and searchlights. Even then the venture is hazardous for the Zeppelins owing to the increasing effectiveness of our night-flying aeroplanes—which is likely to increase still further.

It seems probable that the Zeppelin raid on the Yorkshire and Lincolnshire coast on Monday night was in the nature of a reconnaissance to discover whether

SBAC
THE SOCIETY OF BRITISH AIRCRAFT CONSTRUCTORS

KINDLY MENTION "THE AEROPLANE" WHEN CORRESPONDING WITH ADVERTISERS.

our night flying machines had been withdrawn from the North in order to protect London against nocturnal aeroplanes. Probably the Zeppelins have discovered that any such assumption is erroneous, and that the anti-Zeppelin aeroplane differs considerably from the anti-Gotha aeroplane. I use the word Gotha generically for all big bomb-dropping aeroplanes in this instance.

At the same time it would be foolish to disregard the Zeppelin entirely, or to assume the complete veracity of stories from Germany which would have us believe that all Zeppelin and other airship factories have been transformed into shops for the production of big bomb-dropping aeroplanes. It is necessary still to maintain a reasonable force of anti-Zeppelin machines in the Provinces.

The Real Defence.

So far as the defence of London is concerned, I am more than ever convinced that it should be chiefly defended from Dunkirk rather than from its own environs. It is easier to patrol from Nieuport to Flushing than round the whole periphery of London at a radius of twenty miles from Charing Cross. Also, systematic bombing of German aerodromes in Belgium by a force of our big bomb-droppers detailed exclusively for that purpose under an energetic and intellectual officer, well served by an efficient intelligence department, and quite independent of any Naval or Military command in the same area. As suggested before, this force might be under the G.O.C. Home Defences, but it should certainly not be under any other command which could divert it to the advertisement of sea forces or to the affairs of the Army.

Warnings.

As I have stated already in another place, I am strongly of the opinion that warnings should be given of night raids, for preference by bombs, as in the case of day raids. The shock of being awakened by the explosion is modified if one knows that it is only a warning and not the real thing. Also, there is definitely a protection in being up and dressed when a raid begins.

Delicate persons shivering in cellars or in cold concrete passages in their night gear are more likely to die from the effects of the cold than from the bombs, and nothing will quite remove the idea that the basement is the safest place, or prevent nervous people from going there.

Moreover, in case of a house being damaged by a bomb, a fully dressed and shod person climbing out of or over the wreckage is less likely to be seriously injured than one clad only in night attire. Again, if the inhabitants of a damaged house are forced to quit it in a hurry and cannot return to it, they will be in a better position to attend to their affairs next day if they leave properly dressed than otherwise.

On the other hand, I can see no good reason whatever against giving warning of an impending raid. If the signal bombs are constantly ready at the various fire stations, they can be sent up as easily at night as by day. My plea is simply for a "dressing bell" warning a quarter of an hour before the raid arrives, and I suggest that my reasons are sound. Quite apart from the fact that the average man will agree that a chap does look a silly ass in his pyjamas in the street, and quite apart from the views of either sex as to the charm of feminine déshabillé, I think most people would prefer to be told that a raid was arriving.

Meantime we may regard the recent raids merely as preliminary skirmishes. It depends, I fancy, more on the Supply Department of the Air Board whether the really serious aerial engagements of the future take place over London, over the country of our unfortunate Ally Belgium, or over the German industrial cities along the Rhine. The last is presumably preferable as the war area, and such a preference may be made effective if the supply problem is tackled intelligently above and honestly below.—C. G. G.

REPRISALS.

By W. Barnard Faraday, LL.B., Barrister at Law, Secretary of the Aeronautical Society.

There is a great deal of talk about reprisals to-day. This, in view of the anger stirred up in London by the deaths of women and children, is to be expected for feeling runs high. It is curious to note, however, that the military value of reprisals is merely a secondary part of the discussion. What the public—or that section of the public which expresses itself in the newspapers—is in doubt about is the morality of the proceeding. This discussion is in general very loose and ill-informed, and it is in the hope that I may be able to assist people to a conclusion that I venture to add my voice to the clamour.

In my opinion "reprisals" are just as moral as the execution of a murderer, the imprisonment of a thief, or the killing of an enemy soldier by troops defending their home-land.

What do we mean by reprisals?

There exists, in what used to be the comity of nations, a body of law which is called "Public International Law." This regulates intercourse, either peaceful or belligerent, between nations. It fixes their relations and tells them how they must behave. Treating States as persons, Public International Law is to the family of nations what English law is to English citizens, or French or other law to the citizens of France or other countries.

Now if an Englishman breaks an English law he is punished, because the State enforces its own laws by bringing to book those who violate them, but if a nation breaks an International Law, there is no supreme authority over the family of nations to punish the offender. Hence we have a saying that "International Law is no law at all."

It is this that Germany is relying upon. She has violated International Law again and again, contemptuously and arrogantly, because she thinks that there is no one to punish her.

Now if the facts were really like this, humanity would be in very bad case and at the mercy of any bumptious and unscrupulous State that chose to violate decency, but, fortunately, there are two methods of enforcing public order. The first of these is the unwillingness of any people to permit their government or military forces to do anything openly barbarous or contrary to human usage.

In the case of Germany, the public conscience is by no means a sensitive once, and this method may be ignored without injustice to the moral sense of the Teuton Empire. The other method is the only one left to us, and that method is "Reprisals."

Now limiting the matter to war (for reprisals do not necessarily mean killing people, and are not unknown in peace), reprisals mean briefly that if A does something wrong to B, B can protest, he can invite neutral nations to remonstrate, he can appeal to such International Tribunals as there may be. If none of these things are of any use he can resort to reprisals.

Now in the present case there are no neutral nations competent to remonstrate; there is no International Tribunal worth a yard of pink tape, and we have already protested. Therefore, provided the Germans have violated International Law in dropping bombs on London from the air, we have the right to punish Germany by violating the same law that she broke herself to such extent as will make her realise her wrongdoing.

The legal definition of reprisals under these circumstances would be "Acts of Retaliation by way of special punishment inflicted on enemies guilty of breaking the laws of war."

Is the dropping of bombs on London against the laws of war?

It is maintained, a defended fortress or town being liable to bombardment or assault, that the Huns have a perfect right (London being in a sense defended) to bombard it, attack by aircraft being in effect bombardment. It is, however, an accepted rule that no place containing a civilian population may be bombarded unless 24 hours' notice be given, the principle being that the risk to innocent civilians must be reduced as low as possible.

Now each raid is not part of a continuous bombardment, but is a distinct and separate attack, and strictly, every time the Huns drop bombs they ought to give 24 hours' notice. It is manifest that the Huns' reply to this contention would be similar to that which they gave in the submarine argument—"if we give

notice we might as well leave the business alone; these are new weapons, the result of our Kultur; why should we be handicapped by out of date rules?"

To this there can be only one answer. "It is true these are new weapons, but you must make your weapons fit the law, not alter the law to suit your weapons, and if you break the law we will punish you."

In a word we should be entitled to make reprisal, if the German Government did not comply, in both letter and spirit, with the various International Congresses and Conferences which have laid down the laws of war.

Reprisals need not be in kind. When Dr. Crippen poisoned his wife, the State did not poison Dr. Crippen. They hanged him. When Bill Sykes stole a pair of boots, the State did not take Mr. Sykes's boots. They put him in prison. Just so, when Germany commits unlawful outrage on us we need not commit the same sort of outrage on her. We are entitled to do something unpleasant to her as a punishment, that we should not otherwise have the right to do, by such means as we find most immediately convenient.

Reprisals may be by air, earth, fire or water. They should be clearly announced and promptly follow the crime. Reprisal by air most appeals to the popular fancy, and there is much to be said for it. Reprisals for the ill-treatment of British prisoners in Germany, the murder of Miss Cavell, the submarine outrages, and the air raids on London—these could be made by bombing Cologne, Essen, Berlin, Pumpernickel and Koepenik, or any other seat of German civilisation that captured the Air Board's vagrant fancy.

Whether reprisals of another sort have not already been made, or whether air raids on Germany are desirable or possible in the military sense, are questions outside the scope of this article.

TURIN TO LONDON.

From "The Times" of September 25th.

A remarkably fine feat was achieved yesterday by Captain the Marquess Giulio Laureati, of the Italian Air Service, who for the first time completed the journey from Italy to England by air without a stop. He left Turin at 8.28 (Italian time) yesterday morning, and landed at Hounslow at 2.50 in the afternoon, having completed a journey of 1,050 kilometres (656¼ miles) in 7 hours 22 minutes and 30 seconds.

Captain Laureati flew an S.I.A. machine, and carried a passenger, Air Mechanic Michael Angelo Tonzo, and two machine-guns. From Turin he followed the railway as far as Susa, on the Italian frontier. Crossing the Alps by the Mont Cenis at an altitude of nearly 12,000ft., he passed over Lanslebourg and rejoined the railway at Modane. During the crossing of the Alps he encountered rough weather, and throughout the whole of the journey he had to face a strong north-westerly wind.

From Modane, still following the line of the railway, the aviator travelled north-west to Culoz, which he reached in 1 hour 40 minutes from Turin, and continuing on the same line passed over Verdun-sur-Doubs. He crossed the Cote d'Or, and proceeded by way of Flavigny and Bussy, across the Seine and the Marne, passing to the east of Paris, and completing his transit of France by way of Compiègne, Amiens, and Cap Gris Nez. Throughout this part of the journey he kept an average height of about 9,900 ft. He crossed the Channel in 15 minutes, dropped to 2,000 ft. to pick up his bearings at Lympne, and completed his journey to Hounslow without misadventure, except for a slight détour made in error over Hendon

He carried with him, in addition to copies of yesterday morning's issue of the *Gazeta del Popolo*, an autograph letter from his King to King George, and letters to Mr. Lloyd George, Lord Derby, Mr. Balfour, Lord Montagu of Beaulieu, and the Lord Mayor of London. He was met on arrival by Admiral Mark Ker, on behalf of the Admiralty, Major Gerald Tharp, representing the War Office, and Major Stonor on behalf of the Air Board, Colonel Mola, Italian Military Attaché, Princess Potenziani, the Duke and Duchess of Mondragone, Marquess Theodoli, Baron Mayor des Planches (Italian High Commissioner), Prince Borghese, and other members of the Italian Embassy staff, and a number of Italian officers. He was none the worse for the journey. The Italian officers and British aviators carried him shoulder high from his machine amid much cheering, and before he left the aerodrome he was enthusiastically greeted by numbers of British flying men and mechanics.

During the flight he took food from a bottle fastened inside his coat and fitted with a rubber tube like an infant's feeding-bottle, but he landed with a hearty appetite.

Captain Laureati distinguished himself on August 26th by making a journey from Turin to Naples and back, a distance of 920 miles, without descending. He is a handsome man of sturdy build, about 40 years of age. He wears the ribbons of the Bronze Military Cross, the Silver Military Cross, and the red, white, and green ribbon of the present campaign.

Captain the Marquess Giulio Laureati was born at Grottamare (Marche), on July 11th, 1877, and is therefore 40 years of age. He is a married man. He began flying privately for pleasure in 1908, since when he has used practically every known type of plane. He entered on his military career in the Air Service of the Italian Army in 1911, and received his official warrants as a pilot in 1912. In the present war he has bombarded the Austrian lines no fewer than 25 times, being a specialist in this branch of aerial activity, for which he employs a Caproni plane.

Last night Captain Laureati was honoured with a message of congratulation from the King.

[In connection with this flight it is well to recall that in July Sous Lieut. Marchal flew from Nancy 800 miles across Germany and landed, owing to plug trouble, only a few miles short of the Russian lines. Also, in June, 1914—before the war—the German aviator Suvelack, with a passenger, flew from Berlin to Eggré Palanka, on the Turkish-Bulgarian frontier, just on 1,000 miles, without a stop.—Ed.]

Photograph by "Sport and General."

KITE-BALLOON ACCIDENTS.

The breaking away of a balloon from its moorings in the outskirts of London on Sept. 21st led to two deaths. The wind was strong and gusty, and the runaway balloon turned over and threw out the occupant of the observation car, a Royal Flying Corps officer. He was killed, the body being picked up shortly afterwards.

The cables of this balloon appear to have become entangled with those of other captive balloons, which were up at the time, and tore three of them away. Apparently only one of these balloons carried an observer.

Loosely connected by their entangled cables, the four balloons travelled away in the breeze, and it was noticed that the observer had failed to get clear by using his parachute, and was hanging amid the wires. About 1 o'clock the four balloons passed over South Norwood, and the observer fell from a height of 2,000 ft. into a field on South Norwood Hill. He was killed instantly. The body was removed to the mortuary at Croydon. The runaway balloons now carried no other human freight, and, it is stated in the Press, that they were shot down by anti-

aircraft guns, though it seems unlikely that live shell would be fired in other circumstances than those of an air raid.

There was considerable excitement in South-West London on Sept 20th when an observation balloon was seen to catch fire while passing over the Victoria district. The gas had apparently ignited, and the balloon, rapidly rotating at a low altitude, drifted across the river towards the Surrey side. While over mid-stream the aeronaut released a parachute, and, watched by thousands of fascinated people, leapt with it from the basket and made a spectacular descent just below Chelsea Bridge on the south side of the Thames. He landed uninjured, while the remains of the balloon sailed about five miles further, and fell at Dulwich.

MONDAY'S RAID.

The following account of the air raid of September 24th is taken from "The Morning Post":—

The first of the raiders appeared over the South-Eastern district of London about five minutes past eight, and he was immediately followed by others from the same direction. The anti-aircraft guns of the London defences were brought into action, and it was stated that a considerable number of British aviators were co-operating with the defence batteries. From eight o'clock until 9.25 the anti-aircraft guns were continuously in action. During the attack star shells were frequently employed in order to assist the searchlights, but save in rare instances the majority of the raiders remained undetected. The explosions caused by some of the missiles were deafening. The public, although taken completely unawares, behaved splendidly, and betook themselves to the shelters which had been provided in the City and West End.

AIR RAID WARNINGS.

The following directions on the subject of shelter from air raids issued by the Commissioner for the guidance of the police are published for general information:—

When the "Take Cover" notice is given the public are advised, if in the streets, to get out of them, if in their homes, to remain there. During daylight hours there is no difficulty in securing shelter in a building, but it is essential that it should be in a building that affords the protection of an intervening wall or other similar obstruction of substance. An open area below ground level affords good protection against a bomb exploding in the street.

All police stations will admit throughout the 24 hours to the full extent of their accommodation persons seeking shelter there. During the hours when they are open, the public in galleries, museums, public libraries, and other places of public resort will be allowed to remain on the premises till the raid is over.

The tube and other railway stations which provide secure shelter will admit the public without charge, as long as the stations are open for traffic, and if already sheltered there, till the raid is over, and police arrangements have been made as far as practicable for the regulation of the persons congregating there. Elsewhere there are numerous other buildings affording good shelter which will be made available both day and night for the purpose. At all police stations there is a list of those premises considered suitable.

The managers of premises affording shelter (particularly at night) are invited, upon the issue of the "Take Cover" notice, to exhibit a placard with the inscription, "Air Raid—Shelter." They can obtain this printed inscription on application at the local police station, and should have it mounted on a board for exhibition. As the managers at night may not know of the issue of the "Take Cover" notice, constables, special and regular, will as far as practicable be detailed to apprise them and assist in regulating the persons admitted.

The Lord Mayor of London has received a memorial signed by some hundreds of resident City housekeepers, appealing for more efficient night warning on the approach of hostile aircraft. The majority of housekeepers, they say, sleep on the top floors where the "take cover" warning cannot be heard. If more efficient means could be adopted, it would be possible to convey the women and children to the comparative safety of the basements.

GUARDIANS ON STRIKE.

At a meeting of the Poplar Guardians on Sept. 20th, Councillor Sumner raised the question of the refusal of the London Country Council to give effect to a resolution passed by the Borough Council a month ago, to open all public buildings as shelters or refuges during air raids. The speaker said that if the London County Council persisted in their attitude, the Borough Council were determined to refuse to pay their contribution towards the county rate.

Councillor Adams seconded a resolution of indignant protest, and said that if the schools and other buildings were not opened by the London County Council as requested by the Borough Council, he would make one of a number to go with iron bars and break them open.

Mr. Henry Heath, a past chairman of the Board, agreed with the resolution which was carried unanimously.

THE WORK OF THE BROTHERS BARNWELL.

One who worked with the late Harold Barnwell from the earliest days of aviation sends some additional information which is of considerable interest:—

In 1908 the Brothers Barnwell built a curious "canard" type monoplane. This machine had an air-cooled 90 degree V-twin engine, designed and built by Harold Barnwell. Both the brothers made attempts to fly it, but it never left the ground and its speed over the ground was not much over 20 m.p.h. In 1909 the brothers built the biplane which was illustrated in the obituary note on Mr. Harold Barnwell. In this case Harold Barnwell did two flights, both of which ended in crashes.

The brothers then tried what they thought would be a less easily crashable type, as the big biplanes of the period were too elaborate for them to maintain. Harold Barnwell renovated his old 90 degree V-twin engine and built a kind of "parasol" monoplane. Frank Barnwell produced simultaneously a smaller edition of the machine with a 10-12 h.p. Jap. motor-cycle engine. Neither of the machines did much good—Harold Barnwell's machine taxied fiercely about the ground, but the other little machine, according to her designer's account, "only chewed herself up when we managed to start the engine and ended ingloriously without leaving the shed."

At the beginning of 1910 Mr. Frank Barnwell returned to shipbuilding work with the Fairfield Company, but later joined the Bristol Company with the excellent results known to all. Mr. Harold Barnwell continued his work alone and produced what at this date appears to have been an extraordinary good effort at design. The machine was a little tractor monoplane of very clean lines and fitted with a two cylinder horizontally opposed water-cooled engine.

On this he did quite an amount of short distance flying and incidentally won a prize for the first Scottish-built machine to fly over a mile. After his second and fairly comprehensive smash on this machine, caused by stalling it in the effort to avoid some telegraphic wires, Mr. Harold Barnwell determined to come south to learn to fly before building anything more himself. It seems well to recall this machine because it flew really well and was considerably in front of its time. Undoubtedly a modern pilot could give quite a good show on a similar machine. Harold Barnwell's subsequent work was all done in the south, as was related in the recent memoir in this paper.

INSPECTORS' EXPENSES.

One gathers that at times certain R.N.V.R. officers employed on inspection duty, not only under Royal Naval Air Service, but in other branches of production, experience difficulty in obtaining prompt settlement of travelling expenses. The R.N.V.R. officer is not highly paid, and, consequently, unless he happens to have a handsome private income, he is rather apt to find himself in somewhat straitened circumstances if he is compelled to lay out money on travelling, and has to wait before his expenses are paid.

Officers who find themselves in such a predicament will do well to remember that Article 1508 of the King's Regulations lays down that officers whose duties necessitate frequent journeys are entitled to obtain advances to meet their anticipated expenses. Claims for expenditures are rendered monthly, and when these claims are sent in officers are entitled to a further advance if required.

Owing to the growth of the various Services, naturally the regular Service accountancy staff is considerably overworked, and delays must occur on occasion, but so long as the original advance is adequate, officers need not necessarily be out of pocket at all. One understands that if necessary an officer may make arrangements to retain a small standing advance in order that he may always have money in hand. It is hoped that this information may be of use to those who have hitherto been ignorant of the fact that they are entitled to an advance.

OUR FATHER.

The Navy is our Father (in the strictly legal sense
That binds an obligation just of shillings, pounds, and pence)'
A parent so neglectful of us children of the Air
That had not Hope maintained us we'd have died of sheer despair.
For Father didn't want us, and he didn't want to know
Just what it was we wanted, or the why or wherefore, so,
When lurid lights of warfare first came flashing through the sky,
Our Father quite forgot us and the fact that we could fly,
Till someone chanced to tell him, in a non-committal way,
That if he cared to notice there was Purpose in our Play.
So Father grew uneasy, for he found he had to own
That he was going reaping where he knew he hadn't sown;
So then he turned and mocked us, to his everlasting shame,
And even took exception to the fact we bore his name.
But, while he fumed and fretted in the grandeur of his mists,
Wherever there was fighting we were entered in the lists,
And we have wrought our purpose so to "seek out and destroy"
The forces of our foemen and of those in his employ.
And now we're feeling restless, for we feel that we could—well
Such funny things DO happen that it's very hard to tell.

R.N.A.S.

From a painting by Mr. SANDFORD PITT.

KINDLY MENTION "THE AEROPLANE" WHEN CORRESPONDING WITH ADVERTISERS.

NAVAL and MILITARY AERONAUTICS

FROM THE "LONDON GAZETTE."

Admiralty, Sept. 13th.

R.N.A.S.—Flt. Sub-Lt. to be Flt. Lt.:—M. McMaster, Aug. 15th.

War Office, Sept. 17th.

The King has been pleased to confer the Military Cross on the following Officers in recognition of their gallantry and devotion to duty in the field:—

Lt. (temp. Capt.) Roderick Leopold Keller, R. War. R., Spec. Res. and R.F.C.

For conspicuous gallantry and devotion to duty in attacking hostile aircraft, destroying one, and driving down others out of control. His dash and offensive spirit on all occasions have been splendid.

Temp. Sec. Lt. Edward Mannock, R.E. and R.F.C.

In the course of many combats he has driven off a large number of enemy machines, and has forced down three balloons, showing a very fine offensive spirit and great fearlessness in attacking the enemy at close range and low altitudes under heavy fire from the ground.

Sec. Lt. Andrew Edward McKeever, R.F.C., Spec. Res.

For conspicuous gallantry and devotion to duty, particularly when on offensive patrol. He attacked eight enemy aircraft single-handed at close range, and by his splendid dash and determination destroyed one and drove five down completely out of control. He had previously shown exceptional fearlessness in attacking the enemy when in superior numbers, and in the space of three weeks he destroyed eight hostile machines, setting a very fine example to his squadron.

Temp. Lt. (temp. Capt.) John Theobald Milne, Gen. List and R.F.C.

Whilst leading offensive patrols, he has shown great determination and courage in attacking hostile formations, although in superior numbers, at close range. He has also done long and arduous reconnaissances and secured good photographs under very adverse conditions and heavy fire, displaying throughout an admirable spirit of fearlessness and energy.

Sec. Lt. (temp. Capt.) Richard Raymond-Barker, Gen. List and R.F.C.

For conspicuous gallantry and devotion to duty when leading a fighting patrol. He attacked a large hostile formation, destroying two of them. He has also done excellent work in leading distant photographic reconnaissances, notably upon two occasions when his skilful leadership enabled photographs to be taken of all the required hostile area in spite of repeated attacks from enemy aircraft. He has helped to destroy seven hostile machines, and has at all times displayed conspicuous skill and gallantry.

Sec. Lt. Archibald Charles Reeves, R.F.C., Spec. Res

For conspicuous gallantry and devotion to duty in artillery observation, contact patrols and reconnaissance. He has continually done very daring and excellent work at low altitudes with a fine disregard of hostile fire and adverse weather conditions, and he has contributed information of the greatest value by his enterprise and fearlessness on all occasions.

Sec. Lt. Cecil Roy Richards, R.F.C., Spec. Res.

For conspicuous gallantry and devotion to duty when on offensive patrols in attacking and shooting down hostile machines. On one occasion he shot down four in one day, displaying great dash and a fine offensive spirit.

Temp. Sec. Lt. (temp. Lt.) Alexander Roulstone, Gen. List and R.F.C.

For conspicuous gallantry and devotion to duty when engaged in aerial fighting and in photographic reconnaissances. In spite of continual hostile attacks he has proved most successful in securing photographs, and on several occasions he shot down enemy machines out of control, displaying skilful manœuvring and great determination.

Temp. Capt. Henry Philip Rushforth, Gen. List and R.F.C.

For conspicuous gallantry and devotion to duty in leading bombing raids, the majority of which have been on distant objectives. Notably on one occasion he led a most successful raid under extremely adverse weather conditions, in spite of which the objective was reached and bombed from a low altitude, after which the whole formation of eight machines returned in safety, after a total flight of over five hours. The success of the operation was due to his determination and fine leadership.

Temp. Sec. Lt. (temp. Lt.) Owen John Frederick Scholte, Gen. List and R.F.C.

For conspicuous gallantry and devotion to duty on many occasions whilst carrying out reconnaissances and especially whilst protecting machines returning from patrols. He has continually distinguished himself by discovering hostile aircraft whilst observing from high altitude, and attacking them with great determination and success at close range. His vigilance, combined with his fine offensive spirit, have many times proved invaluable in frustrating hostile reconnaissances and driving their machines down out of control.

Temp. Sec. Lt. Charles Douglas Smart, Gen. List and R.F.C.

For conspicuous gallantry and devotion to duty when acting as pilot to another officer. They faced a violent thunderstorm, accompanied by a gale of wind and blinding rain, which had compelled all other machines to return to their aerodromes or to make forced landings, in order to locate the position of our infantry in the front line. This they successfully did, having spent one and a half hour in the air under fearful conditions, and returned with an accurate and valuable report to Headquarters.

Sec. Lt. (temp. Capt.) Donald Fasken Stevenson, Yeo. and R.F.C.

For conspicuous gallantry and devotion to duty in carrying out three contact patrols in one day in bad weather, and at low altitudes. Although attacked by enemy machines in superior numbers, he drove them off, and by his fine reconnaissance work brought back valuable information. He has at all times displayed indomitable pluck and initiative.

Lt. Oliver Stewart, Midd'x R. and R.F.C.

For conspicuous gallantry and devotion to duty. He has done consistent good work for six months, both on escorts and offensive patrols, and has displayed great fearlessness and skill during severe fighting at close range with enemy machines, successfully holding his own, although on several occasions outnumbered by them.

Temp. Sec. Lt. Richard Michael Trevethan, Gen. List and R.F.C.

When on offensive patrols he has continuously displayed the greatest dash and determination in attacking enemy formations, regardless of their superiority in numbers, and has shot down at least four, driving others down out of control.

Temp. Capt. Ernest Leslie Williams, Gen. List and R.F.C.

For conspicuous gallantry and devotion to duty in co-operating with our artillery, often under extremely unfavourable weather conditions. On one occasion in particular, although very much hampered by mist and clouds, he ranged three of our batteries onto a hostile battery position and enabled them to demolish it. His splendid example has been of the greatest value to his squadron.

Sec. Lt. Walter Bertram Wood, Hamp. R. and R.F.C.

For conspicuous gallantry and devotion to duty on many occasions, when engaged with hostile aircraft, during which he has shown a fine offensive spirit and the utmost fearlessness. He has had no less than 23 combats, in the course of which he has destroyed and driven down numerous enemy machines, frequently attacking several single-handed, and on one occasion fighting with his revolver when he had run short of gun ammunition.

OLEOS are the World's Premier Sparking Plugs. Experience at home and at the front has proved them to be without an equal for every type of engine—Rotary, Radial or Stationary.

CANADIAN FORCE.

Lt. Richard Duncan, Mtd. Rif. and R.F.C.

For conspicuous gallantry and devotion to duty in carrying out the duties of artillery pilot. When a hostile attack was imminent he carried out a reconnaissance at a very low altitude which enabled him to observe and report upon the position of the enemy infantry well behind their front line. He also accurately located their artillery, although his machine was much damaged by fire from the ground. He displayed splendid fearlessness and determination.

* * *

The King has been pleased to award the Military Medal for bravery in the Field to the following Men :—

6642 1st Cl. Air Mech. F. J. W. Adams, R.F.C. (Blackheath, S.E.).

7773 1st Cl. Air Mech. H. R. Deane, R.F.C. (Marylebone).

64246 1st Cl. Air Mech. H. V. Rowlatt, R.F.C. (Peterborough).

WAR OFFICE, Sept. 18th.

REGULAR FORCES.—STAFF.—GENERAL STAFF.—G.S.O., 1st Grade.—Maj. (temp. Lt.-Col. R.A.F.) J. C. G. A. Hankey, Res. of Officers, and to retain his temp. rank whilst so empld., Aug. 2nd, 1917.

TEMP. APPTS. AT THE WAR OFFICE.—Dep. Asst. Dirs.—July 20th, 1917 : Temp. Lt.-Col. A. C. Macdonald, D.S.O., R.E. ; temp. Capt. G. Waddell, Gen. List, from a Staff Capt. ; temp. Capt. F. D. Outram, Gen. List, from a Staff Capt., Aug. 16th, 1917.

ESTABLISHMENTS.—R.F.C.—MIL. WING.—Sqdn. Comdr.—Lt. (temp. Capt.) A. C. Wright, Spec. Res., from a Flt. Comdr., and to be temp. Maj. whilst so empld., Aug. 27th.

Spec. Appt. (Graded as a Park Comdr.).—Temp. Capt. T. E. Gilmour, Gen. List, from Examining Officer (graded as an Equipment Officer, 1st Cl. at a School of Mil. Aeronautics), and to be temp. Maj. whilst so empld., Aug. 7th.

WAR OFFICE, Sept. 19th.

REGULAR FORCES.—The following Wt. to be Sec. Lt. for service in the field :—

R.F.C.—MIL. WING.—Actg. Sgt.-Maj. E. Maynell, July 22nd. Men to be temp. Sec. Lts. :—

R.F.C.—MIL. WING.—Spr. J. V. Southon, from R.E., June 30th. 1st Cl. Air Mech. J. J. Williamson, July 27th.

ESTABLISHMENTS.—R.F.C.—MIL. WING.—Flt. Comdrs.—From Flying Officers, and to be tempt. Capts. whilst so empld. :—Temp. Lt. C. A. Brewster-Joske, Gen. List, June 18th. Lt. D. S. Hall, A. and S. Highrs., T.F. ; temp. Sec. Lt. L. V. Thorowgood, Gen. List, Aug. 31st. Temp. Lt. W. A. Wright, Gen. List ; temp. Sec. Lt. N. MacMillan, Gen. List, Sept. 1st ; temp. Sec. Lt. F. H. Bickerton, Gen. List, Sept. 3rd. Lt. C. T. Lally, Spec. Res., temp. Sec. Lt. M. A. Hancock, M.G. Corps, Sept. 4th.

Adjt.—Lt. (temp. Capt.) T. M. Eggar, Co. of Lond. R., T.F., from a Staff Officer, 2nd Cl. (graded as a Brig.-Maj.), and to retain his temp. rank (without pay or allowances), Sept. 4th.

SCHOOL OF INSTN.—SCHOOL OF MIL. AERONAUTICS.—Comdts.—(Graded as Wing Comdrs.). From Comdt., Staff Officers, 1st Cl., graded as A.A.Gs., and to retain their temp. rank whilst so empld. :—Maj. (temp. Lt.-Col.) I. M. Bonham-Carter, North'd Fus. ; Maj. (temp. Lt.-Col.) B. R. W. Beor, R.A., July 6th. Capt. (temp. Maj.) Lord A. R. Innes-Ker, D.S.O., Household Cav., from a Sqdn. Comdr., and to be temp. Lt.-Col. whilst so empld., Aug. 19th.

Asst Comdts.—(Graded as Park Comdrs.).—From Asst. Comdts., Staff Officers, 2nd Cl. (graded as Brig.-Maj.) :—Temp. Capt. F. A. Forde, Gen. List, and to be temp. Maj., from July 6th to 19th. Capt. C. S. McNab, Camn. Highrs., and to be temp. Maj. whilst so empld., July 6th. Maj. P. E. L. Elgee, R. Berks R., vice temp. Maj. F. A. Forde, Gen. List, July 19th.

Chief Instr.—(Graded as a Sqdn. Comdr.).—Maj. G. B. Stopford, R.A., from a Sqdn. Comdr., Aug. 19th.

Instr.—Graded as a Flt. Comdr.—Sec. Lt. (temp. Capt.) W. C. Campbell, M.C., Spec. Res., from a Flt. Comdr., Aug. 19th.

WAR OFFICE, Sept 20th.

REGULAR FORCES—ESTABLISHMENTS.—R.F.C.—MIL. WING.—Staff Officer, 2nd Cl.—(Graded as a Brig.-Maj.) :—Lt. (temp. Capt.) W. O. Raikes, E. Kent R., Spec. Res., from an Adjt., vice Lt. (temp. Capt.) T. M. Eggar, Lond. R., T.F., and to retain his temp. rank whilst so empld., Sept. 4th.

Dir. of Aviation.—Maj. (temp. Lt.-Col.) G. M. Griffith, R.A., from an Asst. Dir. of Aeronautics, and to be temp. Col. whilst so empld., Sept. 1st.

Flt. Comdrs.—From Flying Officers :—Lt. (temp. Capt.) W. H. Williams, Lan. Fus., T.F., June 24th. And to be temp. Capts. whilst so empld. :—Sec. Lt. L. S. M. Page, Yeo., T.F., July 15th. Sec. Lt. (temp. Lt.) T. Henderson, R.E., T.F., Sept. 1st. Capt. W. Smyth, Lond. R., T.F., from a Flying Officer, Sept. 4th. From Flying Officers, and to be temp. Capts. whilst so empld. :—Sec. Lt. J. M. Allport, Spec. Res. ; Sec. Lt. (temp. Lt.) W. E. Kemp, R. Lanc. R., Spec. Res., Sept. 5th.

Equipment Officers, 1st Cl.—Lt. F. C. Buck, Spec. Res., from the 3rd Cl., and to be temp. Capt. whilst so empld., Sept. 1st.

SCHOOLS OF INSTRUCTION.—SCHOOL OF MIL. AERONAUTICS.—Instr.—(Graded as an Equipment Officer, 1st Cl.) :—Temp. Lt. F. de B. Collenette, Gen. List, from an Asst. Instr. (graded as an Equipment Officer, 2nd Cl.), and to be temp. Capt. whilst so empld., Aug. 31st.

Gen. List.—To be temp. Sec. Lts. :—Sgt. D. M. Rawcliffe, from R.F.C., Sept. 3rd. Sgt.-Maj. H. M. Piper, from R.F.C., Sept. 8th.

ADMIRALTY, Sept. 21st.

A dispatch has been received from Vice-Admiral Sir Rosslyn E. Wemyss, K.C.B., C.M.G., M.V.O., late Commander-in-Chief, East Indies Station, covering a report by Captain Wilfrid Nunn, C.M.G., D.S.O., R.N., on the operations of H.M. Gunboats in Mesopotamia from December, 1916, to March, 1917, which makes the following reference to the work of aircraft :—

Operations on the Tigris during the months of December, 1916, and January, February, and March, 1917, which led to the capture and occupation of Bagdad by our forces on March 11th, 1917.

The gunboats at the Tigris front have co-operated with the Army in many intermittent bombardments of the enemy positions, and some very good results have been obtained, besides frequently engaging enemy aircraft.

We have at all times received great help from the Army, the Artillery Officers and Staff being indefatigable in rendering the Navy every assistance.

The 14th Kite Balloon Section, R.N.A.S., commanded by Commander Francis R. Wrottesley, R.N., marked for us on many occasions, besides the useful work it has done keeping look-out for the Army.

Aeroplanes have also been frequently put at the disposal of the Royal Navy for spotting.

WAR OFFICE, Sept. 21st.

REGULAR FORCES—ESTABLISHMENTS.—R.F.C.—MIL. WING.—Special Appt.—(Graded as an Equipment Officer, 2nd Cl.)—The unit of Sec. Lt. A. G. Saxty is Som. L.I., T.F., and not as in the "Gazette" of Aug. 25th.

WAR OFFICE, Sept. 22nd.

REGULAR FORCES.—ESTABLISHMENTS.—R.F.C.—MIL. WING.—Sqdn. Comdr.—Temp. Lt. (temp. Capt.) J. C. Russell, R.E., from a Flt. Comdr., and to be temp. Maj. while so empld., Sept. 11th.

Flt. Comdrs.—From Flying Officers :—Sec. Lt. (temp. Lt.) E. G. E. Donaldson, R.F.A., Spec. Res., and to be temp. Capt. while so empld., Sept. 8th. Capt. F. H. Lawrence, Worc. R., Spec. Res., Sept. 9th. Lt. R. M. Charley, Spec. Res., and to be temp. Capt. while so empld., Sept. 11th.

Special Appt.—Graded as an Equipment Officer, 2nd Cl.—Temp. Sec. Lt. A. W. Smith, Gen. List, from an Equipment Officer, 3rd Cl., and to be temp. Lt. while so empld., Aug. 1st. (Substituted for the notification in the "Gazette" of Aug. 24th.)

Equipment Officers, 1st Cl.—Temp. Capt. W. A. W. Hallam, Gen. List, from a Staff Capt. at the War Office, Aug. 27th. 2nd Cl.—From the 3rd Cl., and to be temp. Lts. while so empld. :—Sec. Lts. H. R. Brutey and A. W. Grigsby, Spec. Res., Aug. 6th. Temp. Lt. R. Cadman, Gen. List, from the 3rd Cl., Aug. 7th. Temp. Lt. M. L. Horn, Gen. List, from the 3rd Cl., Sept. 14th. 3rd Cl.—Temp. Sec. Lt. (on prob.) J. H. Lowry, Gen. List, and to be confirmed in his rank, Feb. 8th. Sec. Lt. (on prob.) C. B. Charlewood, Spec. Res., April 22nd.

SCHOOLS OF INSTN.—SCHOOL OF MIL. AERONAUTICS.—Comdt.—Graded as a Sqdn. Comdr.—Maj. B. F. Vernon-Harcourt, Welsh R., a Sqdn. Comdr., June 15th.

Chief Instr.—Graded as a Sqdn. Comdr.—Lt. (temp. Capt.) H. F. Fisher, Spec. Res., a Flt. Comdr., and to be temp. Maj. while so empld., May 26th.

Instrs.—Graded as a Flt. Comdr.—Sec. Lt. (temp. Lt.) L. M. Woodhouse, Yeo., T.F., a Flying Officer, and to be temp. Capt. while so empld., Sept. 16th. Graded as an Equipment Officer, 1st Cl.—Temp. Lt. R. Rainford, Gen. List, from an Asst. Instr. (graded as an Equipment Officer, 2nd Cl.), and to be temp. Capt. while so empld., July 6th.

Gen. List.—Flt. Sgt. J. A. Sparks, from R.F.C., to be temp. Sec. Lt., Sept. 8th.

OVERSEAS CONTINGENTS.—CANADA.—R.F.C. AND P.P.C.L.I.—Temp. Maj. A. D. Carter is secd. for duty with the R.F.C., Aug. 14th.

CAN. INF. BNS.—Temp. Capt. R. W. Bell is secd. for duty with the R.F.C., Aug. 16th.

WAR OFFICE, Sept. 24th.

REGULAR FORCES.—STAFF.—ATTD. TO HDQR. UNITS.—Brig.-Majs.—Temp. Capt. A. Murray, Gen. List, vice Lt. A. McR. Moffatt, Arg. and Suth'd. Highrs., Aug. 18th.

Staff Capts.—Lt. H. French, W. York. R., Spec. Res., from Adjt., R.F.C., and to be temp. Capt. whilst so empld., vice temp. Capt. A. Murray, Gen. List, Aug. 18th.

R.F.C.—MIL. WING.—Wing Comdrs.—From Sqdn. Comdrs., and to be temp. Lt.-Cols. while so empld. :—Capt. (temp. Maj.)

THE

'Guardian Angel' Parachutes

THE GUARDIAN ANGEL PARACHUTES
TRADE MARK
(REGISTERED)

From the "WEEKLY DISPATCH," September 16th, 1917.

CURIOUS FLYING FATALITY.

Officer falls from Machine near Birmingham.

"An astonishing aeroplane fatality occurred near Birmingham, on Friday night, an Australian aviator, named Kitto Billing, falling out of his machine, while looping the loop.

"The deceased, a second-lieutenant, had attained a height of about 2,000 feet, when he was seen to fall from his machine. The latter righted itself temporarily and then crashed to earth in a wood at Water Orton. A search party was immediately organised, but it was not until 10 o'clock yesterday morning that the deceased officer's body was found, a mile from where the machine lay wrecked. The cushion which the aviator had used was found half a mile from the body."

"Two inquests were held yesterday, one at Folkestone, the other at Hendon, on officers killed while flying."

This Accident could not have happened if this Officer had been provided with the Safety Harness supplied with the "Guardian Angel" Parachute.

While giving the Airman much more freedom in his cockpit than the usual belt, to which so many Airmen have objections, **the Safety Harness not only holds him down to his seat, but affords him complete liberty, while still held into the machine, to stand up and fire a Lewis gun downwards to the rear, or in any other direction**; and if, while sitting down or standing up, a wing should be destroyed by shrapnel, the Airman can instantly release himself, and leave his machine on either side, whichever may be the lower, and be **floating down to safety in 2½ seconds.**

SEEING IS BELIEVING.

Airmen are invited to come and see the "GUARDIAN ANGEL" Airman's Harness, as fitted to a fuselage with the Parachute equipment, and to try it for themselves. The Harness can be worn quite loosely and adjusted to give the Airman any degree of freedom he may desire, in the cockpit. **However loosely the Harness may be worn, its safety in a Parachute descent is not impaired.**

THE MORAL—IN £ S. D.

It is important to note that if this Aeroplane had been fitted with our appliances as part of its normal equipment, not only the **man**, but the **machine** itself, would have been saved. The cost to the Country of this accident cannot be less than £4,000. For this sum the complete **either-side** equipment could be furnished to 20 Aeroplanes.

RELIABILITY—first. RELIABILITY—second. RELIABILITY—ALL THE TIME.

E. R. CALTHROP'S Aerial Patents, Ltd.,

Adjts.—Lt. F. A. M. Rawes, R.A., Spec. Res., vice Lt. M. Nicholson, R.F.A., T.F., July 9th. Temp. Sec. Lt. R. C. Wansbrough, S. Staffs R., and to be temp. Capt. (with pay and allowances as Lt.) while so empld., vice Lt. H. French, W. Yorks R., Spec. Res., Aug. 18th. Capt. A. M. Wilson, Gord. Highrs., T.F., from a Flying Officer, Sept. 3rd. Sec. Lt. J. T. Pym, E. Surr. R., Spec. Res., to be temp. Capt. (with pay and allowances as Lt.) while so empld., and to be secd., Sept. 11th.

School of Instn.—Schools of Mil. Aeronautics.—Asst. Instr.—Graded as an Equipment Officer, 2nd Cl.—Temp. Sec. Lt. C. W. Duffield, Gen. List, a Flying Officer (Observer), and to be temp. Lt. while so empld., vice Lt. E. W. Vaughan, Spec. Res., Sept. 8th.

Memoranda.—Qrmrs. and Hon. Lts. to be Hon. Capts. (July 1st, unless otherwise stated):—W. J. D. Pryce (temp. Maj.), R.F.C.; T. Lyons (temp. Capt.), R.F.C., Aug. 12th. A. Fletcher, M.C. (temp. Lt.-Col.), R.F.C., Aug. 30th.

* * *

The following are among the Decorations and Medals awarded by the Allied Powers at various dates to the British Forces for distinguished services rendered during the course of the campaign. The King has given unrestricted permission in all cases to wear the Decorations and Medals in question:—

Conferred by the King of the Belgians.

Ordre de Léopold.

Commandeur.

Maj.-Gen. H. M. Trenchard, C.B., D.S.O.

Chevalier.

Temp. Capt. N. A. Bolton, Spec. List and R.F.C.
Lt. (temp. Capt.) C. M. B. Chapman, M.C., E. Kent. R. and R.F.C.
Sec. Lt. (temp. Capt.) J. M. Child, Manch. R. and R.F.C.
Lt. (temp. Capt.) J. C. Russell, R.E. and R.F.C.
Sec. Lt. (temp. Capt.) J. C. Slessor, M.C., Spec. Res.

Ordre de la Couronne

Officier.

Lt. (temp. Maj.) J. E. A. Baldwin, Hrs. and R.F.C.
Sec. Lt. (temp. Maj.) L. A. Tilney, Household Cav. and R.F.C.

Chevalier.

Temp. Sec. Lt. S. Cockerell, Gen. List and R.F.C.
Temp. Sec. Lt. J. H. O. Jones, Spec. List and R.F.C.
Sec. Lt. (temp. Lt.) F. Tymms, M.C., S. Lanc. R. and R.F.C.
Temp. Lt. W. A. Wright, Gen. List and R.F.C.

Decoration Militaire.

22025 Sgt. R. O. Campbell, R.F.C. (Canada).
65088 Sgt. F. Reeday, R.F.C. (Stockport).
7420 1st Cl. Air Mech. C. M. Reynolds, R.F.C. (Birkenhead).
78780 Cpl. E. H. Rich, R.F.C. (Lea Bridge, E.).
12267 2nd Cl. Air Mech. F. N. Taylor, R.F.C. (Slough).
79087 2nd Cl. Air Mech. A. Tibbles, R.F.C. (Kentish Town, N.W.).

Ordre de Leopold.

Chevalier.

Capt. (temp. Lt.-Col.) R. R. Smith-Barry, Flying School.
Capt. (temp. Maj.) the Hon. L. J. E. Twisleton-Wykeham-Fiennes, Oxf. and Bucks L.I. and R.F.C.

Ordre de la Couronne.

Grand Officier.

Lt.-Gen. Sir D. Henderson, K.C.B., D.S.O. Director-General of Mil. Aeronautics.

Officier.

Maj. (temp. Lt.-Col.) C. F. de S. Murphy, D.S.O., M.C., R. Berks R. and R.F.C.

FROM THE COURT CIRCULAR.

Royal Train, Kirklee, Glasgow, Sept. 19th.

The King afterwards visited the Mossend Works of Messrs. William Beardmore & Co. (Limited), and was received by Sir William Beardmore, Bt. (chairman of the company), who presented the general manager and the works manager to His Majesty.

The King then proceeded by motor-car to the works of Messrs. G. and J. Weir (Ltd.), and was there received by the managing director of the company.

NAVAL.

The following promotions and appointments have been made in the Royal Naval Air Service:—

Sept. 19th.—Lt. (temp.).—S. R. Lowcock, promoted to Lt.-Comdr. (temp.), seny. Sept. 17th.

Mr. C. F. Ganard, granted a temp. commission as Lt. (R.N.V.R.), seny. Sept. 18th.

Sept. 22nd.—Temp. commns. (R.N.V.R.) have been granted, seny. as stated:—Lts.—S. Brew, Sept. 17th; and N. F. Bayliss, Sept. 21st.

Sept. 24th.—Temp. Sub-Lieut. G. S. Boston, promoted to temp. lieut., R.N.V.R., with seniority Sept. 21st.

Temp. Flt. Sub-Lieut. E. McD. Wright promoted to Flt. Lieut., with seniority Sept. 21st.

The following decorations conferred on British naval officers and others by the Emperor of Japan were presented at the Admiralty on Sept 21st.

Second Class of the Rising Sun.

Rear-Admiral Charles Lionel Vaughan-Lee.

Third Class of the Rising Sun.

Commodore Murray Fraser Sueter, C.B.

Admiralty Communiqués.

Sept. 23rd.—On the night of the 21st our naval aircraft carried out bombing raids on Thourout and Cortemarck railway stations (eight and ten miles respectively behind the German lines in Flanders).

Thourout Station and lines were hit and a fire resulted. At Cortemarck the station buildings were hit and set on fire.

Bombs were dropped on the docks at Ostend on Saturday.

All our machines returned safely.

During the night of the 20th and morning of the 21st bombing raids were carried out by naval aircraft on the following military objectives: Aertrycke, Sparappelhoek, and Thourout aerodromes, and Thourout railway station. Bombs were also dropped near the Atelier de la Marine (naval workshops), Ostend.

A large quantity of bombs were dropped with good results.

Bombers were attacked by numerous enemy aircraft, which were driven off with the assistance of a Royal Flying Corps patrol.

All our machines returned safely.

Naval works at Ostend were on the 22nd bombarded by the ships of our Belgian coast patrol with satisfactory results.

Three seaplanes, attempting to assist the enemy by observation, were shot down by our air patrol.

The Casualty List.

Reported Sept. 19th.

Killed.—Vernon, Actg. Sqdn. Comdr. T. C., R.N.

Accidentally Killed.—Candey, Mr. H. W., Warrant Telegraphist, R.N.R.

Reported Sept. 20th.

Died of Wounds.—Cain, G., Snr. Res. Attdnt. (R.N.A.S.B.R.), M.15061 Ch.

Gilbert, G., Snr. Res. Attdnt. (R.N.A.S.B.R.), M.9645 Ch.

Reported Sept. 21st.

Drowned.—Dodd, Mr. R., Warrant Officer, R.N.A.S.

Accidentally Injured.—Sturman, Flt. Sub-Lt. E., R.N.

Previously reported Missing (feared lost), now officially reported Prisoners.—Robinson, Flt. Lt. W. E., R.N.

Jenks, Obsr. Sub-Lt. J. C. A., R.N.

Reported Sept. 22nd.

Killed.—Wright, Flt. Sub-Lt. N. S., R.N.

Seriously Injured.—Botterell, Flt Sub-Lt. H. J. L., R.N.

Reported Sept. 24th.

Missing.—Winn, Flt. Sub-Lt. J. H., R.N.
Broughall, Flt. Sub-Lt. H. S., M.C., R.N.
Desbarats, Flt. Sub-Lt. E. W., R.N.
McMillan, Flt. Sub-Lt. R. E., R.N.
Grace, Flt. Sub-Lt. E. V. J., R.N.

Wounded.—Anthony, Flt. Sub-Lt. E., R.N.
Sykes, Flt. Sub-Lt. R., R.N.
Ash, Flt. Sub-Lt. C. F. D., R.N.
Playford, Flt. Sub-Lt. N. P., R.N.

PERSONAL NOTICES.

Deaths.

BETTINGTON.—Squadron Commander A. F. Bettington, R.N., whose death was recorded last week, was 22 years of age. At the outbreak of war he left Cambridge and went to the Central Flying School, where he soon qualified for his certificate and proved a highly skilful pilot. From there he was posted to an R.N.A.S. station in Kent.

While there, on one occasion, he ascended after midnight in pursuit of one of the earliest Zeppelins that came to England. His mount on that occasion was an ordinary 80 h.p. Avro, and on this he chased the Zeppelin across the Channel, but lost it in a mist over the Belgian coast. Whereupon he returned to England, thus making a flight of 2¾ hours in the dark—quite an extraordinary performance for the period.

Thereafter, he went to the Dardanelles and took part in most of the bomb raids carried out by the R.N.A.S. After many months of hard work he was invalided home, and at the time of his death was in command of a gunnery and observers' school. He had only recently been promoted to Squadron Commander. The cause of his death is inexplicable, as the machine which he was flying dived from 5,000 ft. straight into the ground.

On several occasions when enemy machines have visited this country he did extremely good work, and was most anxious to go on active service again. However, he could not be spared from the school, where, as his Commanding Officer wrote, "His magnificent flying was a very useful object lesson to young officers who were learning to become pilots." His C.O. also wrote: "I feel that apart from having lost a most capable officer, I have

lost a personal friend, and I am sure that his death was a great blow to a very large number of officers and men in the Air Service."

The relatives of Flt. Sub-Lieut. W. Houston Stewart, R.N.A.S., and also Sub-Lieut. C. L. Haines, R.N.V.R. (Observer), will be glad to receive any information concerning the fate of these officers who were both reported missing on May 26th.

Any information respecting either officer should be sent to Mr. A. W. Houston Stewart, 123, Abbey Road, Barrow-in-Furness, Lanc.

MILITARY.

G.H.Q. Communiqués.

Sept. 17th.—On the 18th inst. our aeroplanes continued to observe for our artillery, in spite of most unfavourable weather conditions. One hostile machine was driven down out of control. Two of our machines are missing.

Sept. 19th, 9.17 p.m.—In spite of low clouds and a very strong west wind, a considerable amount of artillery work was carried out by us yesterday with aeroplane observation.

Three hostile machines were driven down out of control in air fighting, but combats were few, owing to the small number of German machines in the air.

Three of our aeroplanes are missing.

Sept. 20th, 10.0 p.m.—During the morning the weather cleared, and our aeroplanes were able to take a more active part in the battle, indicating the position of our troops and reporting hostile concentration to our artillery. In this way a number of German counter-attacks were broken up, while others were repulsed by rifle and machine-gun fire of our infantry.

On the 19th inst. the enemy's aircraft took advantage of the exceptionally strong west wind to make repeated attacks upon our artillery machines, turning east at once when approached by our scouts.

Nevertheless, considerable artillery work was done with aeroplane observation, and many photographs were taken by us.

Parties of hostile troops and transport were engaged with machine-gun fire during the day, and over one-and-a-half tons of bombs were dropped on various targets. Another ton of bombs were dropped during the night on the enemy's billets and hutments, in spite of most unfavourable weather.

Six German machines were brought down in fighting and four were driven down out of control.

Seven of our aeroplanes are missing.

Sept. 21st, 9.34 p.m.—On the 20th inst. during the first two hours of our attack low clouds and a drizzling rain made flying almost impossible. However, our aeroplanes flew out at a low altitude and dropped bombs on a hostile aerodrome near Courtrai, besides firing at bodies of German infantry.

As soon as the weather had slightly improved, aerial activity became great. Contact was kept with our advancing troops, and both aeroplanes and balloons gave observations for our artillery. On several occasions the location of enemy troops preparing for a counter-attack was reported to our artillery, who successfully dealt with the situation.

While the attack was in progress our aeroplanes fired from their machine-guns over 28,000 rounds from heights ranging between 100 and 1,000 ft. at the German infantry in their trenches and shell-holes, at reinforcements coming up to the battle, at bodies of hostile troops on roads and working behind the lines, and at hostile batteries, machine-guns, and transport.

By day 68 bombs were dropped on Ledeghem railway station, 96 on two aerodromes north-east of Lille, and 103 on billets, hutments, and ammunition dumps in the battle area.

At night, in spite of most unfavourable weather, two tons of bombs were dropped on Ledeghem, Roulers, and Menin railway stations.

In the middle of the day German aircraft became very active, attempting to interfere with our artillery, bombing, and low-flying machines. In the evening, when the weather improved, they kept well east of the lines and were disinclined to fight.

Ten hostile machines were destroyed and six driven down out of control.

Ten of our aeroplanes are missing.

Sept. 22nd, 9.45 p.m.—On the 21st inst. the weather improved, causing great aerial activity. A great deal of successful work was done with the artillery, our aeroplanes and balloons ranging the guns onto hostile batteries, troops in trenches and shell-holes, and other fleeting targets. Our low-flying machines continued to harass the enemy's infantry and transport in both forward and back areas.

Bombing was also continued, and four tons of bombs were dropped by day on Roulers Railway Station, on an aerodrome and billets in the vicinity of Lille, on an aerodrome south-east of Cambrai, and on hutments in the battle area. At night a further six and a half tons of bombs were dropped on Roulers, Ledeghem, and Menin railway stations, and on masses of transport and troops on the Menin-Ypres road.

The enemy's troops and transport on this road were also effectively engaged with machine-gun fire, many thousand rounds being fired by our machines from a height of 400 ft.

Enemy aircraft was extremely active and aggressive until the afternoon. Activity then died down considerably, the enemy's machines keeping well east of the lines and refusing combat.

Ten German aeroplanes were brought down in fighting and eight others driven down out of control. Another enemy machine was brought down by our infantry on the 20th inst., in addition to those already reported for that day.

Twelve of our machines are missing, including two which have not returned from night bombing.

Sept. 23rd, 9.15 p.m.—On the 22nd inst. misty weather resulted in a decided decrease in the great aerial activity of the last few days.

Our aeroplanes, none the less, carried out successful bombing raids, and during the day dropped 134 bombs on hostile billets, hutments, and aerodromes. In the course of the night a further three tons of bombs were dropped on Roulers, Menin, and Wervicq railway stations.

The enemy dropped a few bombs at midday, doing little damage.

Four enemy aeroplanes were brought down in air fighting, and five were driven down out of control.

Two of our aeroplanes are missing.

Sept. 24th, 9.12 p.m.—On the 23rd inst. there was again a slight lull in aerial operations, though our aeroplanes and balloons continued to observe for our artillery.

Successful bombing raids were also undertaken, in the course of which aeroplanes dropped 167 bombs on hostile billets, hutments and aerodromes.

In air fighting eight enemy machines were brought down and six were driven down out of control. Another hostile machine was brought down by us on the 22nd inst., in addition to those already reported for that day.

Three of our machines are missing.

War Office Communiqué.

Sept. 23rd.—The G.O.C. the British Forces in Macedonia reports:—

During the week our aeroplanes have carried out successful local bombing raids on Puljovo, Kara Oglular (north-west of Doiran), and other places.

Home Command Communiqués.

Sept. 24th, 1.35 a.m.—Hostile airships appeared off the Lincolnshire and Yorkshire coasts early this morning.

The raid is still in progress, and details are not yet to hand.

11.55 p.m.—Hostile aeroplanes attacked the South-East Coast of England this evening.

The raiders came in at different places in Kent and Essex, and a few of them followed the River Thames and attacked London.

Bombs were dropped at several points, and so far the casualties reported amount to six killed and about 20 injured

Sept. 25th, 11.45 a.m.—Latest reports concerning last night's aeroplane raid show that the group of raiders which approached London was driven off by anti-aircraft gun-fire.

Only one, or at most two, machines penetrated the defences.

The casualties in all the raided districts reported by the police up to the present are:—

Killed, 15; injured, 70.

The material damage is not great.

Enemy airships crossed the Yorkshire and Lincolnshire coast between midnight and 3 a.m., but there is no evidence of their having penetrated to any distance inland.

They were driven off by gun-fire from various defended localities which they attempted to approach.

Bombs were dropped at one coast town, three women being slightly injured.

Little material damage was caused.

The Casualty List.

Reported Sept. 19th.

Killed.—Pilkington, Lt. J. O., R.F.C.
Died of Wounds.—Crosbie, Lt. J. C., R.G.A., attd. R.F.C.
Missing.—Quilter, Sec. Lt. E. G. C., R.F.C.

Reported Sept. 20th.

Wounded.—Barker, Capt. W. G., M.C., R.F.C.

AERONAUTICAL ENGINEERING

SUPPLEMENT TO "THE AEROPLANE"

INCORPORATING AIRCRAFT ENGINEERING, AERODYNAMICS, AND MATTERS PERTAINING TO THE AERONAUTICAL ENGINEER AND THE AIRCRAFT TRADER

THE SOCIETY OF BRITISH AIRCRAFT CONSTRUCTORS.

The Second Annual General Meeting of the Society of British Aircraft Instructors was held on August 29th at Caxton Hall, S.W., when the Society's annual report and accounts were submitted.

The Chairman, Mr. H. White Smith, stated that before asking those present rmally to adopt the report and accounts, he would ke to take the opportunity of making a few remarks on the general position of the Society.

He would point out that owing to the way in which e industry had grown, a representative trade organi-tion became much needed, and, as stated in the nual report, the co-ordination of the industry effected rough the Society had, in the opinion of the Manage-ent Committee, unquestionably been of distinct tional benefit.

Many problems arose from time to time in which organised body was absolutely necessary, and no ubt there would be a large number of difficult prob-ms to be tackled when Peace came, when it would even more important to have a strong representative ciety.

As regards the work done the Chairman said that had been running through the minutes of the fferent meetings, and while it would take too long detail all that had been undertaken, he would like refer to a few matters. Before doing this, however, wished to say that the Management Committee d adopted the policy of communicating immediately th members on all points that arose from time to ne.

It was felt that that was the better course. It meant rrying members sometimes, but he thought it was tter to err on the side of consulting members on atters affecting them.

One of the interesting events of the year was the rangement entered into with the Aeronautical ciety of Great Britain, referred to in the report. here was a Standing Joint Committee of the two cieties before whom matters of interest to the two dies came. One very important matter which the int Committee had been considering was the ques-on of the formation of a Research Association for the eronautical Industry, which subject was to be laid fore the Council of the Society.

The Chairman, after referring to the steps which had en taken during the year in various matters of interest to the industry, stated that the Management Committee had various important matters in hand at the present moment, and he felt sure that the Society would be of increasing usefulness to its members as time went on.

A resolution adopting the report and accounts for 1916 was then passed, as also was a resolution to the effect that the present Council should remain in office until the next General Meeting.

The auditors, Messrs. G. A. Touche and Co., were re-elected.

Immediately following the General Meeting, a meeting of the Council of the Society was held, at which Mr. Hamilton Barnsley (Lanchester Motor Co., Ltd.), Mr. E. Allen (C. G. Spencer and Sons, Ltd.), and Captain R. L. Charteris (A.B.C. Motors, Ltd.) were added to the Council, and Mr. Stuart A. Hirst (Blackburn Aeroplane and Motor Co.) was elected to the Council in place of Mr. Robert Blackburn.

Mr. H. White Smith was unanimously re-elected Chairman of the Society.

Mr. R. O. Cary, Mr. L. Coatalen, Mr. J. D. Siddeley and Mr. Howard T. Wright, the four members of the Committee of Management, who had retired and offered themselves for re-election, were unanimously re-elected; and Sir Herbert Austin and Mr. F. Handley Page were elected to fill two places on the Committee left vacant by the resignation of Mr. H. V. Roe and Mr. B. Caillard.

Discussion then followed upon the proposed formation of a Research Association for the Aeronautical Industry. It was pointed out that the Government had set up a new Department—the Department of Scientific and Industrial Research—and had placed a fund of a million sterling at the disposal of that Department to enable it to encourage industries to undertake research.

Briefly, the scheme proposed by the Government is that special Research Associations shall be formed by manufacturers, and that a programme of Research shall be drawn up, the Department making a contribution towards the income raised by the Association for carrying out such programme. The Department would have to approve the Research programme, but it is laid down that the Research Associations are to be formed to carry out a programme of Research, and not for any particular item of Research.

The Government contribution would not be more than pound for pound, and the contribution would be promised for a period of years to be agreed upon, and not

exceeding five. Contributions by firms to a Research Association formed under conditions approved by the Department would be allowed as a deduction for income tax and excess profits duty purposes.

A draft Memorandum of Association for such Research Associations has been prepared by the Department of Scientific and Industrial Research. Put shortly, this Memorandum provides that the objects for which the Research Association is established are:

(a) To promote research and establish laboratories.
(b) To accept grants of Government money, etc.
(c) To employ technical advisers.
(d) To establish museums, libraries, etc.
(e) To investigate inventions, etc., for the purposes of the Industry.
(f) To co-operate with other Associations.

The position of the Aeronautical Industry in relation to this scheme for the development of Scientific and Industrial Research has been under careful consideration by the Standing Joint Committee of the S.B.A.C. and the Aeronautical Society, and conferences have been held with Sir Frank Heath, the secretary to the Government Department in question.

One of the conditions laid down by the Department of Scientific and Industrial Research is that the initial composition of the Board of Management of the Research Association must be approved by the Department. Subsequently, the nominations for Chairman of the Board and for one half of any vacancies that may occur on the Board have to be approved by the Department. The Board of the Association has to appoint a Director of Research or other responsible technical adviser, who could be entrusted with the general direction and supervision of the research work undertaken by the Association.

After discussion of various points involved, it was decided that a Research Association for the Aeronautical Industry should be formed.

On "Break" Clauses.

By "TAMEN."

Just as there are more ways of killing a cat than choking it with butter, so there are more ways of killing an industry than are dreamt of in the philosophy of Horatio or anyone else. Personally, I can imagine no more expeditious and certain way of committing industrial suicide than that offered to an aircraft manufacturer who is invited to sign the existing form of Government contract without modification.

One of the special beauties of what is called the "Break" Clause—presumably on account of its undoubted ability to break anyone who signs it—is the provision that the Government shall have power to terminate contracts at fourteen days' notice, subject to an undertaking to pay for material necessarily in stock or on order; provided that one of the contracting parties—obviously not the manufacturer—shall adjudicate for himself as to whether such materials ever ought to have been ordered or bought. It is suggested that these materials should be taken over at cost price, plus a quite inadequate allowance to cover establishment charges. There must be few, if any, industries to which the Clause providing fourteen days' notice would not be damaging and probably ruinous.

In the case of the aircraft industry, the shortness of the proposed notice is beyond all reasonable limits. To stop down, after fourteen days, work that has only been developed up to its present dimensions by the continuous labour of years, would mean to throw huge bodies of men out of employment, and to all intents and purposes, the destruction of an industry upon which

THE CRICKET TEAM OF THE INTEGRAL PROPELLER CO., LTD., Winners of the Championship of the 1st Division London Munitions Cricket League. Defeated by the W. and G. Team of No. 2 Division in the League Championship Match. On the right, Mrs. Latimer Voight (Joint Managing Director of the Integral Co.). Behind her, Mr. Saunders (Works Manager). On the left, sitting, Mr. E. Latimer Voigt (Joint Managing Director). Behind him, Mr. Stewart (Works Foreman).

OUR Norwich Aircraft Works are specially constructed and organised for the scientific design and efficient manufacture of up-to-date SEAPLANES and AEROPLANES in large quantities.

the very existence of the British Empire has been shown to be dependent. It is obviously absurd to attempt to standardise the notice which ought to be given to various industries. What is adequate in some cases is totally inadequate in others.

There may be examples—though the writer confesses he is not familiar with them—in which fourteen days would be enough. There are others in which fourteen months would not be too much, and the aircraft industry undoubtedly comes very near the long end of the scale.

It would probably be fairly satisfactory if the "fourteen days" clause could be re-worded to read "eight months." Nothing below six months ought for a moment to be contemplated by anyone who knows the circumstances. In this connection, would it not be advisable to provide that the output corresponding to the agreed number of weeks or months, and estimated on the basis of the output actually produced during an equal number of preceding weeks or months, should not be actually due for delivery in the time prescribed, but should preferably be deliverable during some longer period?

For example, if six months' notice were considered reasonable, it might be better not to say that all contracts should be terminable on six months' notice being given, but rather to say that after notice of termination of contract is given, the manufacturer shall deliver to the Government within twelve or perhaps fifteen months a number of machines equivalent to the output of the past six months prior to the receipt of notice of termination.

If, with a view to the commercial demand that will spring up after the war, manufacturers wish to produce types in some ways dissimilar from those at present built, the change would be more easily effected if, during the period of change, the whole energies of the manufacturer were not obliged to be concentrated entirely and exactly on the war-time product.

As regards the other features of the "Break" Clause, the writer has not enough impertinence to attempt to criticise them in detail. Of a surety, criticism is needed, but it ought to come from manufacturers who alone can assess reasonable establishment charges and estimate the cost of handling, storage, and so on.

On one matter of underlying principle, even the outsider may perhaps be permitted to air his views. In referring to materials in stock or on order, the "Break" Clause perpetually reiterates the theory that the Government should only pay for such materials if the purchase or order is regarded by the Minister responsible as reasonable and proper in view of the output to be maintained.

Obviously, we have here a source of endless possible trouble. The contractor may be of the opinion that he cannot maintain his maximum output without providing, let us say, twelve months in advance. The Minister may be of the opinion that four months' supplies in stock or on order would have been amply adequate.

In the event of such a disagreement, the contractor, who had only involved himself in bigger commitments out of a desire to maintain a full output in the interests of the country, would be informed that two-thirds of his commitments had, in the opinion of the Minister, not been reasonably and properly incurred, and the material represented by this two-thirds would consequently be left upon his hands. Evidently, no prudent manufacturer could subscribe to a proposal of this sort, which gives one of the parties in a contract power to vary or construe that contract to suit his own ideas.

Concluding, then, that the Clause will not do as it stands there appear to be two main alternatives between which t choose. One of these would be to secure a written statemen in which the responsible Minister had defined exactly what wa meant by the words "reasonable and proper" in the specifi case under consideration. Investigation might show that manu facturers found it in their opinion impossible to maintain ou put without looking, say, nine months ahead. If that were s the Clause would be rendered infinitely more satisfactory if letter were obtained from the Minister stating that he woul regard all the commitments in respect of material up to th equivalent of a nine-months' output as having been reasonabl and properly incurred.

The other alternative, and probably the better one in th case of this particular industry, though not in all somewha similar cases, would be an actual alteration in the wording o the Clause, providing that the decision should not be left t the Minister, but should be referred to outside arbitration. I the aircraft industry, the circumstances of various firms mu differ immensely, and an actual definition would very likely b quite satisfactory to some and equally unsatisfactory to others

If the second alternative were adopted, each case would b decided individually upon its merits, and the only objectio appears to be the possibility that reference to an outside arbi trator might involve long delays in settlement and a goo deal of acute disagreement in the meanwhile. Nevertheless it is to be hoped that it will be found possible to adopt thi method of improving the "Break" Clause.

Incidentally, it is indeed a subject for congratulation that th aircraft industry has organised itself to negotiate as one entit in matters of this kind. It would be difficult to find a bette example to prove the great necessity for full co-operation amon manufacturers. We have always in this country suffered fro the fact that every Government department takes a detache point of view. Now that the number of departments has bee multiplied, this trouble has become worse than ever.

The terms of a "Break" Clause in Government contract ought really to be made subject to the consideration not onl of the department that enters into the contract, but also o the department of the Government specifically charged with th duty of looking after the permanent interests of British industry

A department which simply wants supplies views the manu facturer merely as a temporary convenience existing for th period during which the department's wants continue. It doe not care in the least what happens to him afterwards, and thu it may, with the best of intentions in the way of reducin public expenditure, succeed in killing an industry which ha been found absolutely essential in the future.

The jealousy which exists between Government department is proverbial. If such jealousy had been eliminated, we shoul not have the Foreign Office and the Board of Trade quarrellin for a quarter of a century as to who should look after Britis commercial Oversea interests, and each only succeeding in pre venting the other from proving effective.

Certainly, there ought to exist some one department charge with the duty of protecting manufacturers against other depart ments, and having sufficient powers to make its interventio effective. In the absence of any such protection of an offici character, the manufacturer must—and fortunately does in ou case—depend on applying the united influence and strength o the whole industry of which he is a unit.

"LURE OF HIGH WAGES."

[The following article from the Austin "Advocate" is worth the attention of all manufacturers.—Ed.]

This heading, suggestive of the latest cinema thrill, was used for a newspaper report of the action recently brought against the Company by the Ministry of Munitions for an alleged breach of the Defence of the Realm Regulations relating to the recruitment of labour. It is a misleading title, and, as it has been given a good deal of prominence, some refutation of its suggestiveness of unfair inducement is necessary. Its publishers apparently overlooked the existence of "the district rate of wages," apart from the fact that the men, in addition to home expenses, would have the cost of "diggings" to meet, with a *certain* increase in the cost of living as compared with the district from which they came. As a matter of fact, he would be little better off, if any, and it can be accepted that the men came more because of the pressing need of munitions and their wish to help, than for any "lure of high wages." No inflated wages were offered, but suitable pay for a good day's work.

The case was heard at St. Austell in the "delectable duchy" of Cornwall, and excited a good deal of interest, being the first case of its kind. The prosecution alleged that the Company had "aided and abetted in the inducement of persons residing at St. Austell at a distance of more than 10 miles from the factory, to accept employment therein, otherwise than by notifying vacancies to an Employment Exchange, contrary to the Defence of the Realm Act."

The Counsel appearing for the Public Prosecutor paid a hig tribute to the Company, stating inter alia "that it made a grea success of the work it undertook, and rendered most valuabl service to the country, for which it had earned and received th thanks of the Ministry of Munitions."

The Defence argued that the labour obtained having bee passed through the Employment Exchanges was the correc interpretation of the Regulations, and as that action had bee taken, no offence was committed. However, the Public Prose cutor prevailed, and fines and costs amounting in all to £9 were inflicted.

That the Company should have been brought to account fo obtaining labour which the Employment Exchanges were un able to provide for the production of essential munitions woul appear to the uninitiated as an irregularity, and to Controlle firms as an application of the provisions of the Defence of th Realm Act, which its promoters did not have in mind whe drafting the section upon which the charge was based: for th men recruited were clay miners engaged upon work which wa not Controlled or of national importance, and were even work ing short time.

The Company did not concern itself with petty restriction which were proved in the Court to be wanting in decision, a evidenced by the fact that a case was allowed to be stated. It efforts were directed to obtain the labour, and the results showe up well in comparison with those of the Government depart ment set up solely for that purpose.—THE EDITOR.

The Production of Aeroplanes and their Components

(Fourteenth Instalment.)

BY STEPNEY BLAKENEY.

Engine Back-plates.

Having completed the flanging of the lightening holes the flanging of the edge of the plate may next be taken in hand.

A Warning.

Before proceeding further, I think it may be advisable to mention to readers of these articles that, in marking off steel plates, there is a certain danger in using a sharp pointed steel scriber, as I have known steel plates which, when marked off thus, have, on being bent or flanged, developed a distinct fracture along the scriber line, and fittings have had to be scrapped from this cause.

To prevent this arising I suggest that a hard brass scriber be used as much as possible, in place of a steel scriber. Centre-pop marks also frequently cause a tear in metal.

Flanging Out.

The marking off of the flange being completed, the flanging may be commenced. If a wooden mallet be used, then a cast-iron or mild steel block can be used as an anvil. If a steel hammer be used, then a hard wood block must be used. Few people seem to realise this.

Also, it is well to note that the quickest way to take twists, kinks, and dents out of sheet metal is to hammer it with a steel hammer on an end grain piece of wood. For some reason best known to themselves some people prefer to hammer a piece of metal furiously on an anvil, which generally ends in the metal being either reduced in gauge, or dented all over with hammer marks. Of course, these look nice, if done in an artistic pattern, but, fortunately, we have not yet arrived at that stage in the manufacture and decoration of aeroplanes. We may come to it after the war.

The Engine Hole.

After the flanges are completed and the corners welded and the whole plate has been tested for squareness and flatness and for its general truth, the centre hole for attaching the engine may be marked off and carefully cut out, and the attachment bolt hole carefully and accurately drilled. No "allowances" can be permitted at all, and dimensions must be worked to very minutely.

In fact, it may be deemed advisable to chuck the engine-plate in a lathe and bore out the hole finally to ensure its being accurate. In removing the greater portion of the centre of the hole it is advisable to drill a considerable number of holes, and cut out the centre by chiselling through the centre of these holes, if not bored out in the lathe.

The front engine-plate may be dealt with in the manner previously described, after which each one should be carefully annealed.

Attaching Engine-plates to Fuselage.

Before drilling the bolt holes in the fuselage for attaching the engine-plates, it is best to clamp the plates in position and test their position, and satisfy oneself that the plates are dead in the centre all ways. If this is not very carefully done, general trouble may be expected, especially in truing up the machine ready for flying, as it will be impossible to line the engine up true with the fuselage.

Petrol Tanks.

The manufacture of the petrol tank might now be considered, and, as this has to fit in between the longerons, it is necessary to work strictly to dimensions, or it may not fit in position.

The workmanship must be extra good, as it has to stand internal air pressure, and all joints, riveting and sweating with solder must be perfect, otherwise serious leaks may develop and cause fire to break out in the air with fatal results.

The material frequently used is tinned-steel sheets of best quality, about 22 to 24 gauge, riveted up with $\frac{1}{8}$-in. snap-headed copper rivets, and best tinman's solder.

The pitch of the rivets is about 1 in. apart. They must be in a dead straight line along the joints, and all rivets must be very carefully snapped, and all riveting must be concentric with the centre-line of the rivets, otherwise they are liable to rejection.

As it is generally a difficult matter to replace rivets, any divergence may mean a tank being scrapped, which is an expensive item to the contractor.

Tank Shells.

The first thing that can be started is the shell. This will be made of two sheets or one sheet, according to the size of the tank and sheets. The theoretical girth of the tank should be most carefully ascertained from the drawings and set out on the sheets together with sufficient margin for flanging and forming the joint at the bottom of the tank where the joint is usually placed.

There are various kinds of joints. The simplest, of course, being a lap joint, riveted, and sweated after riveting. The usual joint is a double-flanged joint, the flanges tightly locking each other, and sweated with solder each side of plate.

Side Panels.

The joint for the side panels is generally made in the following manner:—The side panels having been carefully cut out to the required dimensions, the edges are flanged with a $\frac{1}{2}$-in. flange. The side panel can then be placed inside the shell plates, the edge of the flange of the side panel, which will be outwards, being adjusted all round inside the shell so that the edge of its flange is about $\frac{1}{2}$-in. from the edge of the shell plate.

The side panels are soldered in position, and the flange of the outer shell flanged back over it. After this, the spacing and marking out of the rivet holes can be proceeded with. But before fixing in the side panels, or ends, there is a stiffening diaphragm to be put into the tank shell.

Riveting Ends.

Having marked out the rivet holes for the panels, the quickest way to drill these will be with a small electric portable drill, such as are made by the General Electric Company, this work being done on the tinsmith's bench. As soon as the drilling is complete, the rivets can be put in and carefully riveted over with a small ball-paned hammer, and finished up with a small semi-circular snap.

The riveting being complete, the next thing to do is to spread a neat film of solder over the rivets and into the joint. It must be clearly understood that a thin neat film of solder only is required, and not a thick mass of uneven lumps.

The Stiffening Diaphragm and Fittings.

The next thing to do is to fix the diaphragm plate to stiffen the shell.

Before proceeding, it may be as well to set out the position of any fittings or connections, which have to be attached to the tank by means of rivets, or other ways of attachment, as it will not be possible to do so when both the side panels are in position.

Having attached all fittings, the remaining side panel can be put in, riveted up, and soldered, and all rivet-heads lightly and neatly floated over the solder.

Remarks on Soldering.

With regard to soldering, what is actually required is to consider the soldering-iron a paint brush, and with it cause the solder to flow evenly and cleanly where required. I have met some people who imagine that the process of soldering consists of attaching as many isolated lumps to the work as possible.

If any remark is made about possible leaks owing to untidy rough soldering, they proudly tell you there is plenty of solder, which is just what is not wanted. Half the quantity evenly spread on clean metal with a well-heated iron, thoroughly cleaned, and with plenty of flux, does the job a heap better.

Testing Tanks.

Assuming that the tank is finished, it must now be tested for leaks. One of the recognised ways is to neatly fill it with paraffin, attach a pressure-gauge to it on one of the fittings or outlets, and then with a motor foot-pump, or large bicycle pump, fill the tank with 10 lbs. per square inch air-pressure. Close up all known outlets and leave the tank for 24 hours, then note the pressure in the tank, and look for leaks and make good.

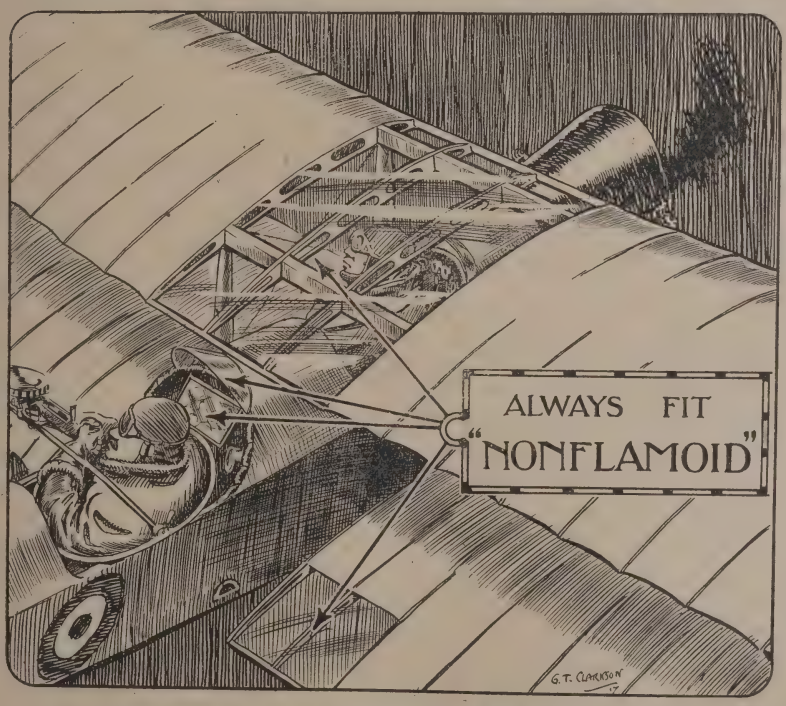
Joining Pipes.

With regard to preparing copper pipes, etc., it occasionally happens that pipes have to be joined. Assuming that we have a $\frac{3}{8}$-in. by 20-gauge copper pipe to join, we can do this various ways, but no way must be adopted that reduces the bore at this particular point. Therefore, to overcome this difficulty, expand each end of the pipes to be joined for a length of $\frac{3}{4}$ in., then obtain a piece of the $\frac{3}{8}$-in. by 20-gauge copper pipe, carefully cut of $1\frac{1}{2}$ in., square the ends, and slightly taper them off, slide this piece into one of the expanded ends of copper pipe to be joined. This must be a slightly loose dropping fit. Then braze this liner in.

Having done this, clean off all superfluous spelter and insert this short length of pipe into the other expanded end of copper pipe, press tightly together, and clamp up. Then braze in a similar manner and clean off.

Another way of joining tubes is to expand one end only and insert the end of the other piece of tube into it and then braze. This makes a simple neat joint, but some people may not consider it quite so strong.

[Yet another way is to butt the two ends together and put an external sleeve over both. This does away with all flanging or expanding out, which is rather likely to weaken the tube by reducing the gauge.—Ed.]



"NONFLAMOID"

REGISTERED

NON-INFLAMMABLE CELLULOID
FOR
WIND SHIELDS, WING COVERINGS OBSERVATION PANELS, & MAP COVERS

SPECIAL NOTICE.

We have on hand a considerable quantity of "Nonflamoid," in strips, 48in. × 7in., and can consequently give immediate delivery of Windscreens or Panels of dimensions not exceeding the above.

Joining and Splicing Cable.

The splicing of steel wire cables for controls is work that can only be done by experienced men. It is simply absolute waste to experiment and to attempt to do this work if you are not trained to it. But other methods of attaching cables to shackles and eyelet bolts are frequently adopted for 5, 10, 15 and 20 cwt. cables in aeroplane and seaplane work.

Before cutting a wire cable, place the cable at the point to be cut into the flame of a blow-lamp, then bind with thin iron wire with two separate bindings, leaving a space between each binding of about ⅛ in., and cut with a sharp steel chisel.

Simple Joint.

To make the cable fast to an eyebolt or shackle, place the cable through the shackle, ring, or eyebolt. Bring about 6 in. through. Then bind this 6 in. to the side of the cable with 20-gauge copper wire for a length determined by the size of the cable, the bindings being about 1/16 in. apart. Then sweat with solder, and then cut off the ends not required. This method is frequently used, and is, if anything, slightly stronger than an ordinary spliced joint. This is not a surmise, but an actual practical fact, which has been proved.

Stretching Cable.

Before any cable is cut to the dead length required, it should be stretched up to its full load. This acts as a test of the strength of the cable, and prevents it from becoming slack after being placed in position in the aeroplane. Also, the stretching probably prevents one having to scrap the cable owing to its developing excessive length after being in use for a time.

(To be continued.)

HAVE WE GOT THE BEST ENGINES?

The following letter has been received :—

Sir,—It may be revealed after the war that better designed aero-engines than some of those at present in use have been turned down by the Air Board, and that engine designs which should have been pigeonholed have been ordered by the thousand. Ugly rumours are flying around, and many are curious to know how one particular engine found its way into an aeroplane, and what is its record up to date?

The method of dealing with designs sent in by practical engineers outside a given circle should be reformed. The official letter signed by a highly-paid official, who probably has no practical knowledge of the subject, is out of date. Let the men who pose as experts give a tangible reason for the nonacceptance of a design, and back their opinion and reputation with their signatures.

Many of our experts are out of date, living on a reputation made many years before the war. To combat the Huns' up-to-date scientific methods we should have a committee of disinterested men with up-to-date business methods, who can tackle the problems daily as they come in, and see that each designer gets a fair hearing without favours.

As things now stand it takes from six weeks to two months to get an official reply, which might have been sent by return of post, because they are all the same, meaningless and noncommittal, and still we marvel not at the cry, "too late."

(Signed) "Intheno."

Farnborough, Hants, Sept. 14th.

BOWDEN WIRE WORKERS AT PLAY.

The grounds of the Harlesden Cricket Club were the scene of the first annual sports (combined on this occasion with the entertainment of wounded soldiers) of the Bowden Wire Social and Athletic Club—an organisation of the workers of Bowden Wire, Ltd., London. The day was fine, the attendance large, and the whole affair enthusiastic and enjoyable—thanks in no small degree to the efforts of the managing director, Mr. J. R. Nisbet, and the firm's chief representative, Mr. Alec. Ross—both well known and experienced in the realms of sport.

In the 100 yards Scratch, a popular winner was Mitchell, a discharged soldier, who had worked very hard for some weeks past in training the tug of war teams. The quarter-mile Handicap was rather easily won by Holdsworth. The quarter-mile Obstacle race fell to Kemp, and the 100 yards Ladies' to Miss Byford. The most popular events were perhaps the two Tugs of War—one for men and one for women—arranged with the firm's neighbours, Messrs. Lyon and Wrench. Bowden Wire Ladies' team were the winners of their event, but the men's team succumbed rather easily to Messrs. Lyon and Wrench. The wounded soldiers, who were the guests of the afternoon, asked for a one-handed pull against a picked team, and enthusiasm ran high when they won after a good pull.

The third concert and tea, given by the Bowden employees to wounded soldiers, is fixed for September 22nd.

AIRCRAFT SUPPLIES CO.'S NEW PREMISES.

Another milestone in the history of the Aircraft Supplies Co., Ltd., is marked by the removal of their Head Offices and Stores to larger and more central premises at "Ascot House," 125, Long Acre, London, W.C.2.

Here, in addition to the General Offices of the Company and the extensive Stores—containing nearly 2,000 bins, comprising almost every conceivable standard aircraft part—will be opened the first show room, devoted entirely to aircraft parts and equipment, where actual parts may be examined, and from which supplies may be taken away without any delay whatever.

The fact that these premises are situated in the heart of the motor-car business shows considerable enterprise on the part of the Company, as at the present time there is hardly a motor-car firm which is not engaged on aircraft production in some form or other, and it is obvious that these firms will also play an important part in the production of aircraft after the war.

Aircraft manufacturers will find that this Company's illustrated fortnightly stock and quotation list will materially assist them in speeding up and increasing their output.

The works, which have been fitted with many new machine tools, are being extended, and remain for the present at Little James Street, Holborn, W.C.1, and the West End Offices of the Company are at 166, Piccadilly, W.1, as hitherto.

The change has necessitated an alteration of telephone number to Gerrard 276 (two lines), and the telegraphic address will now be "Upcast, Rand, London."

AN ADDRESS TO NOTE.

The address of Mr. Ernest Garton, honorary secretary of the British Ignition Apparatus Association, is now No. 9, Northumberland Road, Leamington Spa, to which all letters and communications in connection with the Association should be sent.

ECONOMISING HIGH-SPEED TOOL STEELS.

"From the communications which reach us" (write Barimar, Ltd., of 10, Poland Street, Oxford Street, W.1), "an impression seems to have got abroad that the welding of high-speed tools to shanks of common metal is an innovation. This is a mistake. Our managing director, Mr. C. W. Brett, saw a demonstration of the process in our Paris works as far back as 1906. The great developments now taking place along these lines are entirely due to the abnormal cost of high-speed steel, and as practically every postal delivery brings new applications from engineers in all parts of the country, it seems clear that the benefits of this system are now being fully realised."

A CURIOUS PRECEDENT.

The following letter has been received :—

Sir,—Though we are far from desiring to see the British Government everywhere adopting or imitating the innovations of Allied or other Governments, we think the Premier might well take a leaf out of the book of Governor Whitman, of New York State. The Governor recently met in conference the Editors of the various technical journals in the State, desiring to get reliable evidence upon questions of mechanical production, transport, coal and timber conservation, the provision of machinists and toolmakers, and other vital factors essential to the successful prosecution of the war. As a result, the Governor has now a committee of five Editors acting in an advisory capacity.

Perhaps no class in the community has its fingers more completely upon the pulse of British industries than the men who so worthily and efficiently edit our technical Press, and we feel sure they might with advantage be called in to the State councils where accurate information is above all things essential. At such a moment as this, when, to take only three important branches of public service, the Air, Agriculture, and Marine Departments, there is urgent need for the wisest and sanest counsels as well as driving forces, we think nothing but good could come by the introduction of editorial assistance.

(Signed) Barimar Ltd. (Scientific Welding Engineers)
C. W. Brett,
Managing Director and General Manager.

London, W., Sept. 14th, 1917.

[Mr. Brett's suggestion is certainly interesting, but one cannot imagine that it could possibly be adopted in England, where newspaper editors are regarded by those in high places either as mere conduits for official opinions, or cheaply-bought mouthpieces of those in power—when on the side of the authorities—or else as mud-slinging gutter-dwellers in the pay of place or money hunters—when on the side of the critics of the authorities. It has not yet occurred to our political masters and their appointees that newspaper editors may be men of some intelligence and education who are possessed of a keen desire to do their best for their country.—C. G. G.]

MARKET REPORTS.

Prices given are for quantities on usual terms.

September 20th, 1917.

COPPER.—There is no interest whatever in the Copper Market here, and official prices continue unaltered. The situation in America is being very eagerly watched. The Government still delay fixing the price to be charged for Copper; as stated last week, there were rumours that the price would be about 22½c. per lb.; it is, however, practically certain that 25c. will be nearer the mark; this is a liberal price, but it is a very wise policy not to give producers any excuse for not exerting every ounce of effort towards giving a maximum output. Although some buyers there have been forced into the market owing to depletion of their stocks, they are apparently only buying hand to mouth, pending a settlement of the official price. The U.S.A. labour question is still unsettled; in fact, reports indicate that the position is worse. Supplies here are very satisfactory, and the authorities are still continuing the substitution of iron and steel for brass. This is certainly a wise policy.

Comparative Prices.

To-day	£120 0 0 per ton.
September, 1916	115 10 0 per ton.
September, 1915	69 0 0 per ton.
Highest price, 1916	150 0 0 per ton.

TIN.—As indicated in previous reports, the Tin Market is still far from showing a settled condition. Prices have, during the past week, fluctuated very considerably, advancing from £243 10s. to £247, and declining again to £244 15s.

Delays in arrival of shipments is partially responsible for the unsettlement, and sellers are loth to part with what stocks they hold. There are indications that there is likely to be a demand for early delivery, and this will, of course, influence prices upward.

Comparative Prices.

To-day, 18th	£224 15 0 per ton.
September 14th	245 5 0 per ton.
September 11th	242 0 0 per ton.
Last month	244 0 0 per ton.
1916	170 15 0 per ton.
Highest price, 1916	205 0 0 per ton.

LEAD.—There is very little to report. The Ministry now control all supplies, and the official prices remain unaltered. The U.S.A. Government are arranging to fix a price for American Lead, and we are given to understand that this will be between 8c. or 9c. per lb.

Comparative Prices.

Now	£30 0 0 average.
1916	29 12 6 average.
Highest, 1916	36 10 0 average.

STEEL.—The demand for Aircraft Steels continues undiminished; the output is, however, steadily increasing.

One understands that the Ministry of Munitions is negotiating for the control of Sheet Steel; as a matter of fact, it is believed that a basis price has already been suggested to the makers, but the latter are of the unanimous opinion that the price is much too low. It is to be hoped that the Ministry of Munitions will move very cautiously. Presumably the control of Aircraft Steel Sheet prices will follow.

The Cast Steel position still continues to be serious; supplies of ore are unfortunately far from being satisfactory.

ALUMINIUM.—The position remains the same, and prices are unaltered.

TIMBER.—The shortage of Timber is now affecting 3 ply, and constructors are receiving instructions to use 3-ply Satin Walnut. The results obtained from these boards are quite satisfactory, although the price is a little higher than 3-ply Ash or Birch.

One understands that further experiments with Silver Spruce substitutes have been carried out with fairly good results. It is, however, generally recognised now that it is impossible to find another wood which gives the same results as Silver Spruce. However, it is gratifying to know that there is a possibility of a fairly good substitute being adopted. Whatever is done must be done quickly, and large shipments should be imported without delay if the situation is to be saved. Walnut is still very scarce indeed, but the supplies of Mahogany appear to be fairly satisfactory.

Prices still continue very strong.

FABRIC.—The labour troubles in Ireland are still unsettled, and the position is seriously exercising the minds of the Air Board officials; also, constructors who are not fortunate enough to have maintained a large stock are viewing the state of affairs with anxiety.

One learns that there is a possibility of the strike being settled before this report is in readers' hands, and can only hope that this will be the case.

CURRENT MARKET PRICES.

(For Week Ending Sept. 21st.)

The prices given below are the prices ruling on the above date.

TERMS.—Usual for the various materials mentioned.

Prices of old metals are as quoted by scrap dealers.

Prices must not be taken as specific quotations for definite quantities delivered to any part of the country.

Aluminium.

Ingot	£225 per ton.
Remelted	£210 per ton.

Brass.

Sheets	15⅞d. per lb.
Strip	14⅞d. per lb.
Wire	15½d. per lb.
Tubes	16½d. per lb.
Castings	15d. per lb.
Turning Rod	14⅜d. per lb.
Brazed Tubes	20½d. per lb.

Copper.

Ingot, Standard, Cash	£120 per ton.
Ingot, Standard, 3 mos.	£119 10s. per ton.
Best Selected (nett)	£131 to £135 per ton.
Sheets	£160 per ton.
Wire	17½d. per lb.
Tubes, S.D.	19¾d. per lb.
Tubes, Brazed	19¾d. per lb.
Rivets	1s. 11½d. per lb., basis.
Tacks	1s. 11d. per lb.

Lead, No Draft	£26
Zinc, Old	£40

THE WATNEY WORKERS AT PLAY.

The sports and fête organised by Messrs. Gordon Watney and Co., Ltd., which were held on Saturday, Sept. 15th, at Weybridge, made it very evident that the employees of the firm had all the essentials necessary to an enjoyable afternoon, and if it is any satisfaction to Major and Mrs. Gordon Watney, it may at once be said that the day revealed the fact that there was every evidence of perfect accord between the executive and the workers.

Needless to say, a programme which included twenty events, in or about four hundred entrants, with a prize list over the value of £140, entailed a strenuous day. The attendance at one time was a strain on the extensive grounds of St. George's College, kindly placed at the disposal of the executive by the president of the College. The natural beauty of the grounds was much enhanced by the very effective manner in which they were laid out by Mr. Dews, the chief engineer of the firm, whose untiring efforts in insuring the success of the meeting deserve the greatest praise, especially taking into consideration the enormous amount of work that is being turned out of the shops.

What has been said of Mr. Dews applies quite as much to others who worked so strenuously on the general committee. The referee, Mr. T. H. Secretan, A.A.A., fortunately, had little trouble in adjusting the trifling differences which arose simply from the eagerness displayed by the competitors. The executive committee, which consisted of Major Watney, Messrs. Eglon, Zillwood and Dews, were most energetic in assuring the success of the meeting. Above all, praise must be given to the chief steward, Mr. J. C. Costigan, the general manager of the works. His various tasks must have made the "Handy Man," famous in the annals of Winchester College, very envious. Lieut. Swaine, R.N.V.R., had all his time cut out as a starter—and to praise each official would not only occupy a great deal of space, but would be an "embarras des richesse," for the work was so evidently a labour of love with each of them—and this remark especially applies to Mrs. D. Watney.

Major Watney showed his whole-hearted determination to give the employees of the firm the best of everything by engaging the full band of the Grenadier Guards, by permission of Colonel Sir H. Streatfield, K.C.V.O., C.B. Captain Williams, M.V.O., Mus. Doc. Oxon, who is director of music, may, perhaps, have had larger audiences, but he can rest assured that, whether they may have been listeners in Paris or in the bygone days of the White City, the art of his conducting or the performance of his men was never more highly appraised than it was at Weybridge.

The presence of a very large number of wounded and convalescent soldiers gave just the required touch that linked the exuberance of the munition maker with the stern reality of those whose "bite hard" at that moment, which was so well expressed by an overseas soldier who, when asked what was the sign of a coming attack answered, "A mackerel sky—a double issue of rum and a chaplain lurking behind—and half-past the hour of dawn."

The climax came when Mrs. Gordon Watney stepped forward to present the prizes. This charming lady showed that her heart, like Major Watney's, is in the interests of the employees of Messrs. Gordon Watney and Co., Ltd., and the ringing cheers that responded to the call for a vote of thanks for what they had done must have proved to them the devotion of the workers. Major-General Sir Alfred Turner, K.C.B., spoke just a few concise words to the vast concourse assembled round the Grand Stand. Quietly but effectively he pointed out the essentials in dealing with the Hun peril, and the singing of the "National Anthem" concluded what must be termed by all present "A Perfect Day."

The following are the results:—

100 yds. handicap (men).—Final: 1, Reeve; 2, Bird; 3, Forster.

Quarter-mile, open, scratch (12 miles radius).—1, T. Green, Vickers; 2, J. E. Forster, Gordon Watneys; 3, F. Collins, Lagonda Works.

Tug of war (ladies).—Final: No. 1B team won by the opening two pulls.

120 yds. hurdle race (men).—Final: 1, T. Mann; 2, W. Hammond; 3, F. J. Heather.

One mile cycle race handicap.—1, A. Willis, scratch; 2, T. Hayes, 18 yds.; 3, L. Sheppard, 15 yds. Eight started.

100 yds. handicap (boys under 18).—Final: 1, Clarke; 2, Muggeridge; 3, Poulter.

100 yds., scratch (12 mile radius).—Final: 1, Green; 2, Perrow; 3, Forster.

AT THE WATNEY WORKERS' SPORTS.—Left to right, Captain Williams, M.V.O. (Bandmaster, Grenadier Guards), the Rev. Father Barry, St. George's College; Major Gordon Watney, Mrs. Watney, General Alfred Turner.

100 yds. handicap (veterans).—Final: 1, Tribe; 2, Mills; 3, Hudston.

High Jump.—T. Mann won by clearing 4 ft. 4 ins., R. Taylor getting as near as 4 ft. 3 ins. Mann afterwards did 4 ft. 9 ins. in an exhibition jump.

Egg and spoon race (ladies).—1, Miss H. M. Moore; 2, Miss E. Mitchell; 3, Mrs. E. Nicholas.

Half-mile handicap (men).—1, W. G. Reeve, 20 yds.; 2, J. W. Nicholas, 35 yds.; 3, W. Hammond, 5 yds.

Slow cycle race (men).—Final: 1, Guttridge; 2, Brown; 3, Harris.

Long jump.—1, T. Mann, 15 ft. 4½ in.; 2, R. Taylor; 3, W. Munday.

80 yds. handicap (ladies).—1, Miss S. Witt, 3 yds.; 2, Miss R. M. Eve, 1 yd.; 3, Miss R. Hopkins. Won by a yard.

One mile handicap (open).—1, B. Muggeridge, 95 yds.; 2, J. Nicholas, 90 yds.; 3, C. F. Dunsden, 10 yds.

Sack race (men).—Final: 1, Collins; 2, Smeed; 3, Brown.

Sack race (ladies).—1, Miss R. Hopkins; 2, Miss W. Symonds.

Thread the needle race (for wounded soldiers and ladies).—1, Miss R. Hopkins and Pte Roberts; 2, Miss E. M. Kent and Pte. Cave.

Potato race (ladies).—Final: 1, Mrs. Nicholas; 2, Miss B. Hopkins; 3, Mrs. E. Illman.

Potato race (men).—1, T. Arras; 2, E. A. Turner; 3, T. Clark.

Slow cycle race (ladies).—Final: 1, Mrs. Illman; 2, Mrs. Nicholas; 3, Miss Tilley.

Quarter-mile handicap.—1, J. E. Forster, scratch; 2, W. J. Reeve, 13 yds.; 3, B. Muggeridge, 13 yds.

Tug of war.—The preliminary pulls had been contested prior to the sports, and the final rested with the Millwrights and the men of the Test Stands. The latter, with the benefit of sound coaching, won by scoring both first and second pulls.

Three miles cycle race handicap.—1, A. Willis, scratch; 2, N. Snow, 60 yds.; 3, J. Hayes, 60 yds.

Relay race.—1, No. 2 Shop (T. Mann, F. Guttridge, J. Hayes and A. Gerrish); 2, Beardmore Shop (B. Muggeridge, A. Roe, W. Hammond and J. Nicholas).

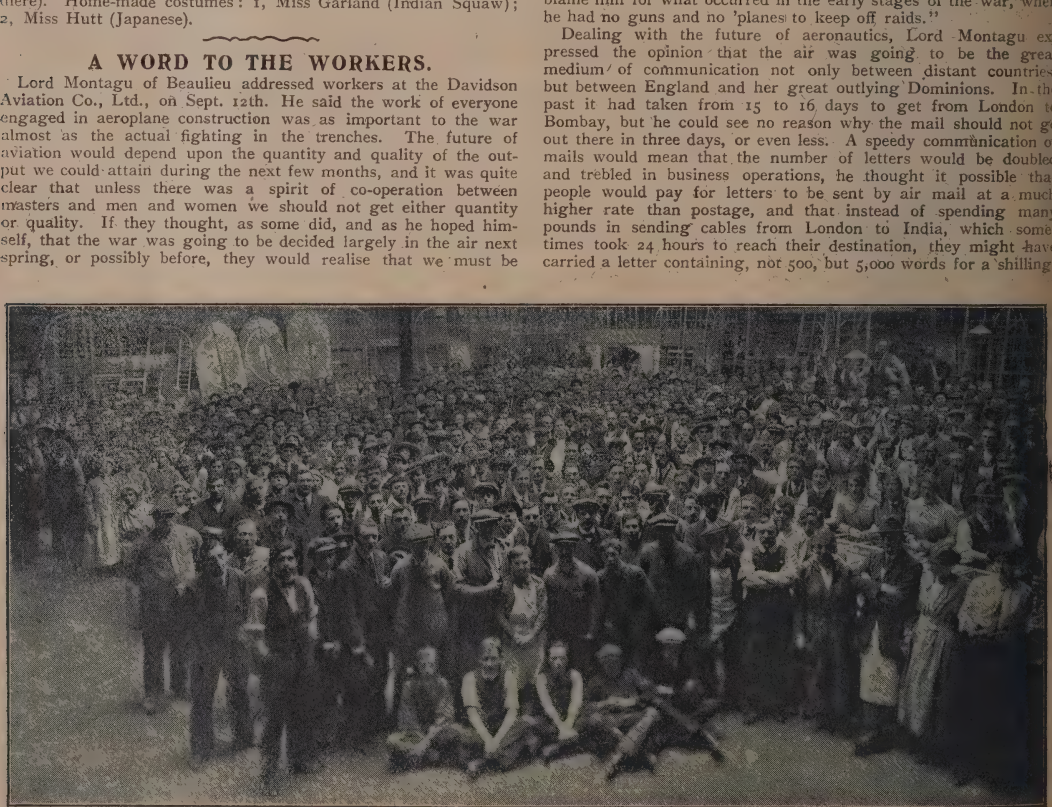
Major Watney's prize for best aggregate of points.—T. Mann.

Costumes (judged by a committee of lady guests).—Hired costumes: 1, Miss Stewart (Irish colleen); 2, Miss Cowie (Vivandiere). Home-made costumes: 1, Miss Garland (Indian Squaw); 2, Miss Hutt (Japanese).

A WORD TO THE WORKERS.

Lord Montagu of Beaulieu addressed workers at the Davidson Aviation Co., Ltd., on Sept. 12th. He said the work of everyone engaged in aeroplane construction was as important to the war almost as the actual fighting in the trenches. The future of aviation would depend upon the quantity and quality of the output we could attain during the next few months, and it was quite clear that unless there was a spirit of co-operation between masters and men and women we should not get either quantity or quality. If they thought, as some did, and as he hoped himself, that the war was going to be decided largely in the air next spring, or possibly before, they would realise that we must be supreme; that the number of our machines must exceed those of the enemy, and we must be in the position to replace wastage.

At the present moment the Germans had realised that, and he could tell them from information he had recently received that the Germans were putting forward every possible effort to increase their output. They had turned nearly all of the large number of workers who had hitherto been working on Zeppelin construction to the construction of aeroplanes.



How many thousands of extra workers that meant he did not know, but it was very considerable, and he had only learned that day from the representative of a distinguished French firm that in France they were of the same opinion, and that quantity and quality of output during this winter would be the most decisive factor in the war of next year.

"The Germans," continued Lord Montagu, "are doing something besides increasing output. They are practising very hard at flying by night. We all know what that is intended to lead to. Well, the only really effective remedy we have is not on this side, but on the other side. We must try and make their aerodromes impossible within flying distance of this country. We must bomb everything we can bomb from our lines in France. I know you will agree with me that we are not going to squeal if we have a few bomb raids in London. You will agree that, while we consider it the duty of the Government to protect the capital of the Empire and its citizens, and those great factories that are turning out aeroplanes and munitions of war, it would be foolish to deplete the front of first-rate squadrons in order to give a sense of false security here.

"Everyone knows that, as regards day raids, we must have efficient and up-to-date squadrons. That, I am ready to believe, has already been provided for, but as regards night raids, it is no good pretending that the work of keeping them off can be done on this side. Greatly as we deplore the casualties of these night raids, we must realise that we are part of the great National Army, that this is a war of nations, and not of select individuals—soldiers—gathered together in the Army.

"I see in some quarters there is a tendency to blame Lord French, Commander-in-Chief of the Home Forces. I am speaking unofficially when I say that I think that, with the limited number of men and amount of material at his disposal, Lord French has done all that it is possible to do. It is unfair to blame him for what occurred in the early stages of the war, when he had no guns and no 'planes to keep off raids."

Dealing with the future of aeronautics, Lord Montagu expressed the opinion that the air was going to be the great medium of communication not only between distant countries, but between England and her great outlying Dominions. In the past it had taken from 15 to 16 days to get from London to Bombay, but he could see no reason why the mail should not go out there in three days, or even less. A speedy communication of mails would mean that the number of letters would be doubled and trebled in business operations, he thought it possible that people would pay for letters to be sent by air mail at a much higher rate than postage, and that instead of spending many pounds in sending cables from London to India, which sometimes took 24 hours to reach their destination, they might have carried a letter containing, not 500, but 5,000 words for a shilling.

TALKING TO THE WORKERS.—The "hands" of the Davidson Aviation Co., Ltd., listening to Lord Montagu's inspiring speech.

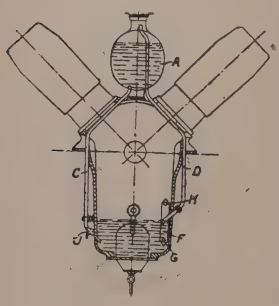
Complete Specifications Accepted, Prints of which can be obtained on and after October 4th, 1917.

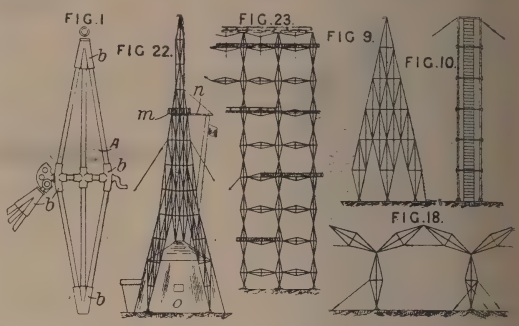
109,279. August 3rd, 1916. Savours, W. M. Structures such as temporary hangars for aircraft.
109,327. Sept. 29th, 1916. Brunessaux, A. H., and Iredale, G. Method of, and apparatus for, dropping bombs and the like from aerial craft.
109,335. Oct. 26th, 1916. Molesworth, H. B. Means for varying the speed of aeroplanes.
109,365. Dec. 21st, 1916. Aeronautical Instrument Co., and Brewer, G. Apparatus for recording or measuring differences in pressure between the gas contents of an aerostat and the external atmosphere.

Abridgments of recently published Specifications.

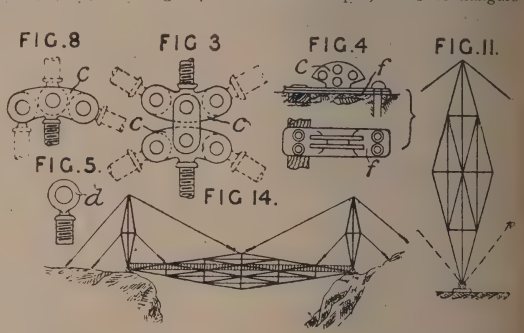


108,047. Sounding-apparatus. Money, G. J., 247, Dalston Lane, London.

Sounding-apparatus for aircraft comprises a kite-shaped body suspended therefrom so arranged that when drawn through the air the pressure tends to force it downwards. Fig. 4 shows a form in which the kite-like body A having a web C for preventing side-ways motion carries a reel F of wire H. The wire H passes through the guide-tube D, through a wheel E attached to the body by wires passing through holes B, and from thence to the aeroplane. The sounding-apparatus may carry various attachments such as a light, bomb, or grappling-iron to enable a bomb to be dropped on an object which has been caught by the grappling-iron.

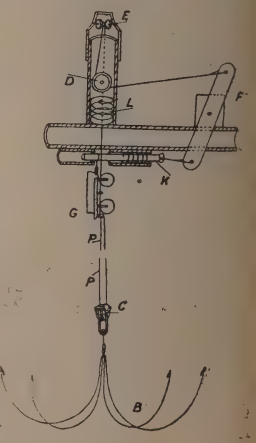


107,963. Lubricators. Soc. Lorraine des Anciens Etablissements de Dietrich and Cie de Luneville, 40, Rue du Colisée, Paris.



In a device for maintaining a constant level of oil in the crank chamber of an internal-combustion engine for aviation and other purposes, comprising an hermetically-sealed reservoir A connected to the crank chamber by oil and air pipes C, D, the lower end of the air pipe D terminates in a box F supported in the crank chamber, with which it communicates by small holes G, H at its lower and upper ends. By this means disturbance of the lubrication by inclination of the engine is minimised. The oil pipe C is fitted with a cock J.

107,765. Structures, building-elements for. Goiffon, P., 6, Nouvelles Maisons, Lyons, France. Convention date, June 15th, 1916. Not yet accepted. Abridged as open to inspection under Sect. 91 of the Act.



Structural work, either permanent or temporary, is formed of a number of similar lozenge-shaped elements A, Fig. 1, composed of steel tubes or bars or of bamboo, secured in three-way socket members *b*, the diagonals forming a cross. The elements are connected together by perforated members *c*, Figs. 3 and 8, and eyes *d*, Fig. 5, which are screwed into the members *b*. The elements are connected to the ground by shoes *f*, Fig. 4. The invention is applicable to the construction of an observation tower, either fixed as shown in Figs. 9 and 10, or movable, as shown in Fig. 11; bascule, suspension, trestle, foot, and other bridges of which Fig. 14 shows one example; sheds or hangars as shown in Fig. 18, or other large halls such as circuses, exhibitions, or theatres; posts for wireless telegraphy, Fig. 22, preferably composed of bamboo elements with a bridge *m*, platform *n*, and tents or shelter *o*; and scaffolding, Fig. 23, for monuments or other tall buildings. The element may be made in miniature as toys for building model structures, and may then be made of any metal.

108,057. Delivering objects from aircraft. Badman, G., 4, Market Place, Coleford, Gloucestershire.

An aircraft is provided with means for delivering whilst in motion an object to another moving aircraft or to stationary objects, independently of their relative positions with respect to the vertical; for example, a bomb to an enemy aircraft or ground works, or mails or messages to friendly aircraft or ground stations. A grapnel, etc., B is hung by a pulley C in the loop of a cord P, one end of which is connected to a carrier G mounted to run on the cord on the other side of the loop, the carrier being normally supported by a spring-bolt K connected to a trigger-lever F, to which the other end of the cord P is connected after passing over the pulleys E, D. This side of the

cord is connected also to a spring L, to avoid shock. When the grapnel B engages another aircraft, etc., the pull on the cord P withdraws the bolt K and releases the carrier, which, by a continuation of the pull, is then drawn along the cord P to its objective.

FIG. 1

108,124. Internal-combustion engines. MURRAY, J. J., 42nd St., New York, U.S.A.

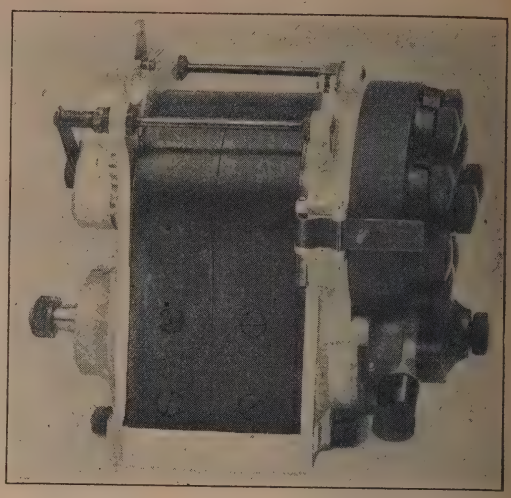
IGNITING, IN.—In an ignition arrangement for rotary-cylinder engines such as described in Specification 104,377, an armature 7 carried by each cylinder sweeps past a stationary field magnet 8. Each armature is connected to the corresponding spark-plug. The field magnet 8 may be adjusted for varying the time of sparking.

A RESIGNATION.

Mr. G. P. H. de Freville wishes it to be known that he no longer has any connection with the firm of Ware and de Freville, Ltd., having resigned from the Board of that Company so long ago as March last, in order to devote himself entirely to the Aluminium Alloy Pistons, Ltd., 8, Great Marlborough Street, W., of which firm he is managing director.

CONTINUITY OF ORDERS.

The following letter has been received :—



Sir,—Your report of Lord Montagu of Beaulieu opening Lady Drogheda's Air Service Exhibition at Sheffield on Sept. 7th contains an appeal to those engaged in aeroplane construction, not to let any domestic disputes hinder the output of aircraft.

Can you give the following the same publicity, so that manufacturers may be appealed to, and not the poor British workman, every time, who are all right?

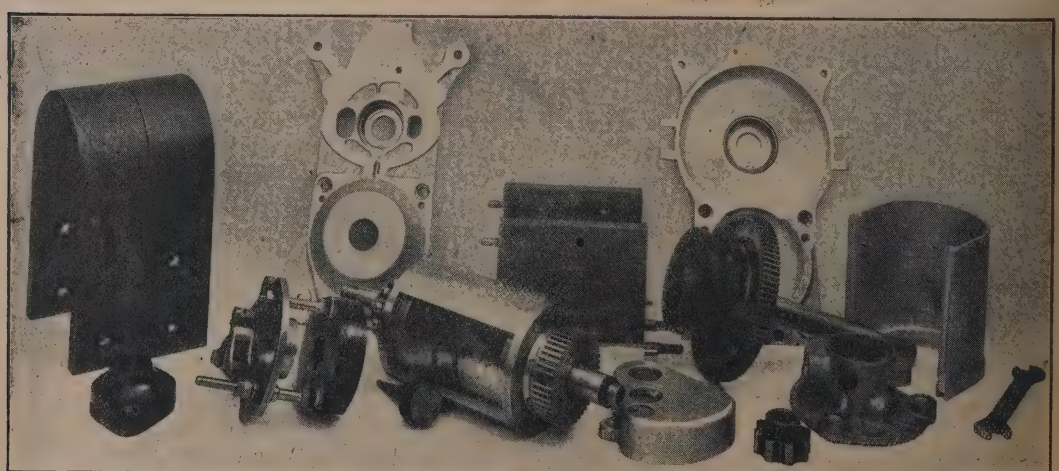
At a large munition factory (Government controlled) in the Midlands, where a great number of men were engaged on aircraft work, production is almost at a standstill. The firm have just completed an order for fighting biplanes and have also received orders for another design of machine and should be producing them.

About two weeks ago something like forty men were discharged (not all of military age), and a week ago others commenced to take a holiday. This week, Saturday, Sept. 15th, a great many more are doing the same, to oblige.

We are not told we *must* take a holiday, but at the same time we are expected to, and to leave our address in case we may be wanted back earlier than expected.

Side View of the B.L.I.C., Type H.L.8.

I do not propose to point out what a loss of machines to the country, and time, etc., this means, when everybody who reads your valued paper is in close touch with aircraft work. What I wish to draw attention to is the slackness on somebody's part for not being able to keep up a continual flow of machines to keep men working who are experienced in aircraft production, instead of having a holiday in the hour of the country's greatest need, and being appealed to when others are to blame.



(Signed) ONLY AN EMPLOYEE.

THE B.L.I.C. MAGNETO.

The illustrations show photographs of a new "B.L.I.C." magneto, just produced for 8-cylinder engines, and manufactured by the British Lighting and Ignition Co., Ltd.

This magneto, which is known as the "B.L.I.C." H.L.8 type, is designed for use on high-speed multi-cylinder engines, and is not of the usual rotary armature type. In this new machine the winding is stationary, and an iron sleeve revolves between the armature core and the pole shoes. By this method it is possible to produce a magneto which gives four electrical impulses per revolution, as compared with two in machines whose armatures are rotated.

The advantages of this arrangement are obvious. The windings, being stationary, are not submitted to any centrifugal strains. The moving mass is reduced to a minimum, and, in addition, the magneto is capable of firing double the number of ignition points with the same speed and revolution. Not the least important feature is that it can be driven with gears running at much lower speeds.

BITS AND PIECES.—Component Parts of the B.L.I.C. Magneto, H.L.8 Type.

AIRCRAFT FINANCE

VOL I. No. 1. ISSUED AS A SUPPLEMENT TO "THE AEROPLANE"

AN INTRODUCTORY NOTE.

The great upheaval brought about as a direct consequence of the war in everything appertaining to Stock Exchange values, and finance generally, has led to many changes. One direct effect has been the creation of new elements of finance dealing with new commercial and industrial developments, with new methods as well as modified and altered regulations.

In this field of activity none have been of greater importance than the development of the aeroplane, at present as an important adjunct to military tactics, and in the future destined to play a most important rôle as a commercial factor and as a means of rapid transport. It is outside the realm of practical politics even to estimate the number of machines, pilots, engineers, and workmen at present engaged in all parts of the world in its manufacture. Much less is one able to compute the amount of capital actually invested and involved in the industry.

Astute and serious manufacturers, capitalists, engineers, and scientists are devoting time, money, and brains to this enterprise, as is evidenced by the number of important limited companies now interested in the manufacture of aeroplanes. From every point of view, satisfaction may be derived from the fact that the whole of this national wealth will go on multiplying and producing step by step as the aeroplane gradually but surely takes its allotted place in the sphere of national working economics.

As soon as hostilities cease, the day will not be far distant when competition, not only in manufacture, but in speed and cost of transport of passengers and goods, will be a matter of international rivalry and competition, and the securities of aeroplane companies must eventually rank in the same category of investment as shipping, railway, omnibus, and kindred companies of national importance, as reliable and sound dividend producers. It will be my aim, week by week, to give information on all matters connected with aeroplane finance and to deal in these columns with all subjects affecting the finance of the industry.

The Treasury and New Issues.

The Treasury regulations affecting new issues of capital to a young industry such as that of aeroplane manufacture is more particularly interesting than to any other class of commercial enterprise, and the official notice circulated recently by the Press Bureau for publication is of vital importance to promoters, directors, and other officials contemplating the incorporation of and the issue of capital for and on behalf of aeroplane companies.

The official notice issued is as follows:—

> "It has come to the knowledge of the Lords Commissioners of the Treasury that offers of underwriting and of participation in new issues have recently been made before the conditions of Regulation 4 (3) of the Temporary Regulations for the reopening of the Stock Exchange have been complied with. Their Lordships desire to inform all persons and houses who transact business in stocks, shares, bonds, or other securities, and all corporations and companies who may wish to issue the same, that the provisions of this Regulation forbid underwriting and the offer of participation in new issues until permission for dealings has been duly given. His Majesty's Government are considering in consultation with the Allied Governments what steps would be taken to deal with the problem when the existing restrictions come to be removed."

Notwithstanding these restrictions, the incorporation of new companies with important capitals continue to be registered, clearly indicating that the Treasury regulations are ineffective, and that companies are formed and subscriptions to capital obtained privately. In actual practice the only effect is that these securities are refused official recognition or quotation on the Stock Exchange.

The notice just issued by the Lords Commissioners of the Treasury is scarcely likely to bring about any alteration in the position. The wording of the regulations themselves is ambiguous, and, if punitive measures are to follow, they should be clearly indicated. The New Issues Committee will have to revise their own policy, and bring about some amelioration in their system of giving decisions if Treasury regulations are to be observed and enforced.

Two important factors should be adopted by the Committee, and acted upon without fear or favour. The first essential should be that no issue be sanctioned which on the face of the proposal is not unquestionably a sound proposition. The Committee cannot, of course, act as guarantors for investors, but the experts of the department are well able to differentiate between sound business, a fair risk, and a "wild-cat" scheme.

The second essential should be that no company, however sound the proposal, should receive Treasury sanction unless it be engaged upon Government work.

It is the clear duty of the Committee to encourage and do all in its power to develop the incorporation of aeroplane companies, for the reason that the growth of the industry is destined to become of the greatest national benefit. If the Treasury would legislate along these lines, it would be rendering a great service, not only to those interested in aeroplane finance, but to the nation and the financial world generally.

DIVIDEND DECLARATIONS.

Sir W. G. Armstrong, Whitworth & Co., Ltd.

An interim dividend on the ordinary shares of this company has just been declared at the rate of 10 per cent. per annum (tax free) for the half-year to June 30th last.

The company in its present form and under its present title dates from January 1st, 1897, though the

original foundation under the Limited Companies Acts dates from 1882.

The present authorised capital is £7,012,500, divided into £1,000,000 4 per cent. Cumulative Preference shares of £5 each, £2,000,000 5 per cent. Second non-Cumulative Preference shares of £1 each, and £4,012,500 Ordinary shares of £1 each. These securities are dealt in on the Stock Exchange. The Accounts are made up to December 31st in each year.

BIRMINGHAM SMALL ARMS COMPANY, LTD.

The directors of the Birmingham Small Arms Company recommend the following final dividends for the year ended July last, payable on 12th proximo :—On the "A" Preference shares at the rate of 5 per cent. (less tax); on the "B" Preference shares at the rate of 6 per cent. (less tax); and on the Ordinary shares at the rate of 5 per cent., together with a bonus of 2s. per share free of tax. These dividends are the same as those paid last year.

A RECENT REGISTRATION.

The Whitehead Aircraft (1917), Ltd., just registered, has been formed with a nominal capital of £1,000,000, divided into 300,000 Preference and 650,000 Ordinary shares of £1 each, and 1,000,000 Deferred Ordinary shares of 1s. each, to take over (inter alia) the business carried on at Richmond, Surrey, by Whitehead Aircraft, Ltd., to manufacture, buy, sell, prepare, let on hire, and deal in aerial conveyances and aircraft of all kinds, and the component parts thereof. Up to date of publication no further information has been issued.—G. A.

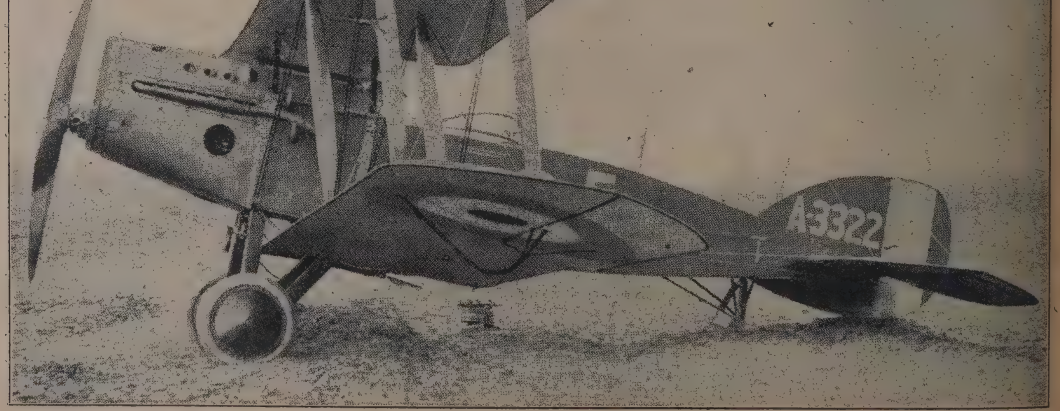
APPOINTMENTS AT BOULTON AND PAUL'S.

The "B.P." magazine, house journal of Boulton and Paul, Ltd., Norwich, records in its August-September issue, several changes upon its directorate and staff.

Mr. Henry Fiske has retired from the position of managing director after 50 years' work with the firm. He has, however, been elected a life director.

Captain J. D. Paul has been re-elected to the board as chairman, and Mr. Stanley Howes has been made a director of the firm.



Mr. J. D. North's appointment as chief of the technical department has already been recorded in THE AEROPLANE.

Mr. M. A. S. Riach has joined the firm as chief theoretical assistant.

Mr. Edouard Boudot, from the North British Diesel Engine Works, Ltd., is now chief of the buying department.

A RESIGNATION.

It should be noted that Mr. Robert P. Grimmer is now no longer connected with the Aircraft Construction Company. Mr. Grimer is willing to accept any position in the Aircraft Industry which will afford the proper utilisation of his previous experience with aeroplane designing and construction.

Reprinted from "Flugsport."

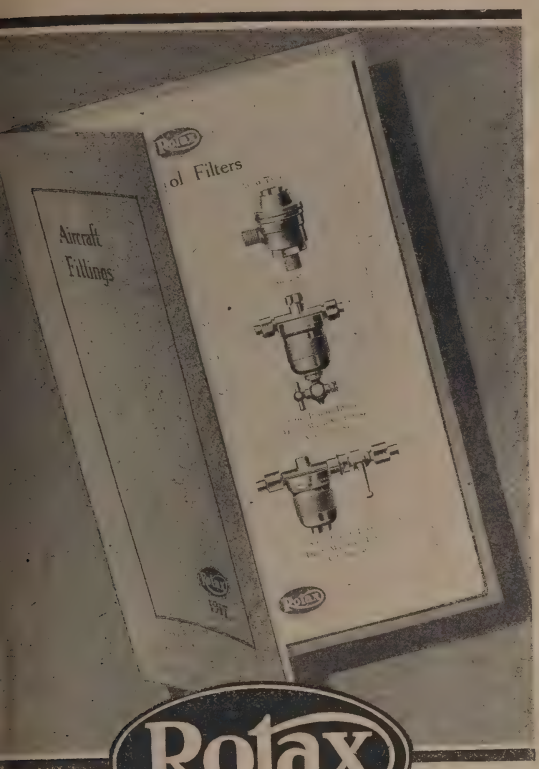
PERSONAL NOTICES.



DEATHS.

BATTERSBY.—Lieut. P. W. Battersby, Yeomanry, attd. R.F.C., who was reported missing on July 7th, and is now believed to have been killed on that date, was the fourth and youngest son of the late Worsley Battersby, of Knowle, Dunster, and of Mrs. Battersby. He is 28 years of age.

BRACEY.—2nd Lieut. Victor Charles Edelsten Bracey, R.F.C., who was killed while flying on September 23rd, was the only

A CAPRONI TRIPLANE.—A colossal 600-h.p. Bomber, and probably the largest machine in Italy.

THOSE Manufacturers of Aeroplanes and Aero Engines who have not yet obtained a copy of our Catalogue "Aircraft Fittings" will find it surprisingly helpful. Fully illustrated it makes a handy little reference. A copy will be sent on receipt of business notice heading.

With the many contracts we have filled before and during the war period, our facilities for production have even increased. To-day is never a measure of what we can do for you to-morrow.

We are prepared to give quotations at all times, but with the necessary reservation that orders will be dealt with in strict rotation.

THE ROTAX MOTOR ACCESSORIES CO., LTD

Willesden Junction, London, N.W. 10.

Where Flying Men are fitted out.

PERFECT PROTECTION.

WEATHER with a 500-h.p. W.; that includes all the most vile things you can think of (and some unthinkable); that's the stuff from which Dunhill's outfits protect the airmen. And weather is weather whether you're doing "straights with instructor" or boast a gun-bus of your very own.

Equip yourself at Dunhill's—cruise out when you will and you'll find wind, rain and cold will bother you about as much as soap does a Laplander.

Dunhill's cut gives you the essential freedom of movement without detracting in any way from style. As speciality outfitters they date back from the "red flag" days of motoring. They were going strong when flying was more "in the air" than it is to-day, and now they are pre-eminent as specialists for airmen.

Everything in Dunhill's is the best for its purpose; the most reliable and the most durable, which means the most economical.

Tunic, in finest whipcord	£5 10s.
Breeches, best Bedford cord	£3 3s.
Leather Coats, made of finest chrome dressed skin, light in weight, soft to handle and fitting like a glove, lined with finest fleece	£9 9s.

A copy of our Catalogue will gladly be sent on request.

Dunhills Ltd.

MANCHESTER: 90 and 92, Cross Street.

GLASGOW: 72, St. Vincent Street.

child of hon. Lieut. William Edelsten Bracey, R.A.M.C., and Mrs. Bracey, Wedmore, Somerset. He was 19 years of age, and at the inquest on September 24th a verdict of accidental death was returned.

FITZHERBERT.—Capt. Wyndham Waterhouse Fitzherbert, Royal Sussex Regt., attd. R.F.C., who was killed on July 7th, aged 25, was the third son of the late W. A. Fitzherbert, Marsden, The Hut, Wellington, New Zealand, and Mrs. Fitzherbert, and grandson of the late Sir William Fitzherbert, K.C.M.G. He was born in New Zealand and educated at Huntley School, Marton, Wanganui College, and afterwards at Marlborough College, England. He returned to New Zealand, and afterwards went to the Argentine to take up farming.

When war broke out he (and his youngest brother, who was killed on July 30th, 1916) came over from the Argentine and enlisted in the 12th Royal Sussex Regt., but shortly afterwards was given a commission in another battalion of that regiment. While in training, before going to France, he passed a musketry course and a machine-gun course with distinction. He went otu to France in March, 1916, and was twice wounded, the second time in June of that year, when he returned to England to hospital.

In December he rejoined his regiment at the front, and was there till the following May, when he joined the R.F.C., and went back to the front in June. He was killed when returning from a long-distance bombing raid.

GODWIN.—Lieut. Thomas Ernest Godwin, Canadian Army, attd. R.F.C., was killed in an air fight on August 21st. He was 24 years of age.

HARGRAVE.—"Death from misadventure" was the verdict returned on September 24th at the inquest on 2nd Lieut. Ernest Hargrave, R.F.C., aged 18, who lost his life as the result of a flying accident during the week-end.

HAWES.—Sec. Lt. Frederick Maxwell Hawes, R.G.A., attchd. R.F.C., second son of the Rev. F. W. Hawes and Mrs. Hawes, of Stapleford Vicarage, Cambridge, who lost his life in an aeroplane accident on September 14th, was born in 1899, and educated at Marlborough College, of which he was a foundation scholar. He went to the Royal Military Academy, Woolwich, in June, 1916, and was gazetted 2nd lieutenant, R.G.A., last February. In the following April he became attached to the R.F.C., in which he soon qualified as pilot, though only 18 years of age.

His O.C. writes of him:—"He was one of the best and keenest pilots I have had, and promised to be quite brilliant." The inquest was held on Monday, September 17th, when it was stated in evidence that the officer was "stunting" at a height of 5,000 ft. He had performed a "loop," and was in the act of beginning another, when a loud crack was heard, and one of the wings was seen to give way. The machine, with its pilot, fell into a large pond, where it was submerged. The jury returned a verdict of "Death by misadventure."

HOBART-HAMPDEN.—Lt. George Miles Awdry Hobart-Hampden, Oxford and Bucks Light Infantry, attd. R.F.C. (killed while flying on Sept. 17th), was 21 years of age. He had his infantry commission in June, 1915, and was promoted in September, 1916; he was gazetted flying officer in December, 1916.

HOFMEYR.—Lt. Richard Hofmeyr, King's Own Yorkshire Light Infantry, attd. R.F.C. (died on hospital ship at sea in the East on September 11th), was twenty-four years of age. He had his commission in the K.O.Y.L.I. in August, 1915, and was attached R.F.C. in August 1916; he was appointed temporary lieutenant in May this year.

HUNT. Mr. E. W. A. Hunt, R.F.C., who was reported missing on May 1st, and is now reported killed on that day, was the eldest son of the late Edward Hunt, C.E., and of S. I. Hunt, of Sidcup. He was 24 years of age.

JENNINGS.—Capt. Alex. Jennings, R.A., Flight Commander, R.F.C., reported missing on April 7th last, is now known to have been killed in aerial fighting on that day. Born in 1894, he was the only son of Mr. and Mrs. W. J. Jennings, of Kennington Hall, near Ashford, Kent, and was educated at Yardley Court, Tonbridge, Tonbridge School, and at Zurich, being at Zurich when war broke out. At the earliest opportunity he returned home, and entered the Royal Military Academy, Woolwich, in December, 1914, passing out in July, 1915, and being posted to a battery of the Royal Horse Artillery. Shortly after obtaining his commission, he was sent to Gallipoli, where he was slightly wounded. He was invalided to Alexandria with a severe attack of typhoid shortly before the evacuation.

He returned to England early in 1916, and while on sick leave obtained the Royal Aero Club's qualification for flying, with the intention of immediately joining the Royal Flying Corps. In May, however, he was sent to a battery at the front, and served with it until he was attached to the R.F.C. in July, when he returned home to train. He obtained his wings in October, and proceeded at once to a squadron at the front.

LENNARD.—Sec. Lt. E. S. R. Lennard, R.F.C., who was killed in action on Sept. 14th, was the youngest son of Mr. and Mrs. F. Lennard, 23, Adelaide Crescent, Hove. He was 19 years of age.

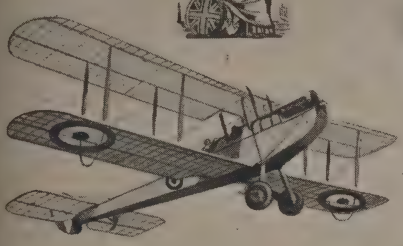
MAITLAND.—Arthur James Maitland, who was killed in a flying accident at Croydon on the 22nd September, was the youngest son of Mr. and Mrs. John Maitland, of Blythwood, Enfield. He was 18 years of age.

MARSHALL-LEWIS.—Sec. Lt. Frank Marshall-Lewis, Royal Warwickshire Regt. and R.F.C., who was killed whilst flying at the front on the 13th inst., was the son of Mrs. Harry Lewis and stepson of Mr. Harry Lewis, of 9, Norland Square, Holland Park, W.11. He was educated at Clephanes College, Great Portland Street, and was in his 20th year. Joining the Civil Service Rifles in November, 1914, he obtained his commission in June, 1915. He had been on active service in France since August 16th, 1916, and saw much fighting. Joining the R.F.C. last March, he went to the front as an observer in the following May. On the day he met his death an eye-witness who was in the trenches writes: "Nothing more wonderful than your son's coolness and courage under terrific anti-aircraft fire could possibly be imagined, and it was the opinion of the commander of the division and of everyone else present that a more daring operation had never been carried out by our flying men."

NUNN.—Lieut. Nunn, R.F.C., was killed at Dartford on September 24th through his aeroplane nose-diving and crashing to earth. The observer, who jumped from the aeroplane, was seriously injured.

PALMER.—Sec. Lt. William Samuel Hudson Palmer, R.F.C., whose death was announced last week, was the only son of Councillor Palmer, of Dalkeith, Latchmere Road, Kingston-on-Thames, and was in his 21st year. He was educated at Hampton Grammar School and Finsbury College, where he gained his qualifying certificate as an electrical engineer. He enlisted as soon as he was 18 years of age in the Artists Rifles, and served in France for some time before receiving his commission in the Royal Flying Corps.

RICKARDS.—Capt. Arthur Traherne Rickards, R.G.A., attd. R.F.C., who was killed on September 13th, aged 24, was the only son of Mr. and Mrs. F. T. Rickards, of 25, Corfton Road, Ealing. He was born in Bombay in 1892, and was educated at Marlborough College and the Central Technical College, Kensington, finishing his engineering training at the McGill University, Montreal. On the outbreak of war he volunteered for service, and returning to England entered Woolwich, and received his commission in the R.G.A. on April 22nd, 1915. Shortly afterwards he proceeded to the front. In January, 1916, he was appointed observer for artillery in the R.F.C., which post he held till the following October, when he returned to England to train as a pilot. He was mentioned in dispatches on November 13th, 1916. He obtained his wings in April, 1917, and returned to the front in May. On July 12th he was promoted captain and flight commander, R.F.C.



His squadron commander writes:—"In the great loss to you our own loss may appear dwarfed, but I assure you that not a man in the squadron but held your son in the highest esteem, and will mourn with you in his passing. To me his gallant death has been a great blow. For two months he had held the post of flight commander with the greatest success, and whilst I was on leave recently he commanded with his usual success. His fine flying was a noble example to others, and I have no hesitation in saying, as I have said to others during his lifetime, that no finer pilot or better fellow ever came to the front. His skill in flying, his head so packed with wisdom, his quiet personality, make me mourn the ill-chance of a stray shell that brought him low, for no Hun that ever took the air would have been a match for him. His part, a fine one, is played."

WATLINGTON.—Sec. Lieut. Henry Joseph Watlington, R.F.C., who was reported missing on July 6th, and is now unofficially reported killed on that date, while engaged on a photographic reconnaissance, was the eldest son of Mr. Henry William Watlington, M.C.P., and Mrs. Watlington, of Bermuda, and was 21 years of age. He was educated at Upper Canada College, Toronto. He enlisted in the Bermuda Volunteer Rifle Corps in September, 1914, and was twice wounded while serving with them in France in 1915. After five months in hospital in England he trained for a commission in the Royal Flying Corps, and was gazetted last March. His commanding officer writes:—"I cannot say how sorry I am to have lost an officer who, although he had been here a very short time, had gained the affection and respect of the squadron and given certain promise of being a brave and useful flying officer." He was married in July, 1916, to Isabel, daughter of Mr. Harrington Emerson and Mrs. Emerson, of New York.

WEAR.—Sec. Lt. Albert Wear, R.F.C., who has been killed in action, was the son of Mr. F. E. Wear, of Middleton Road, Bowes Park, N. After being educated at the Stationers' School, he entered the office of a chartered accountant, and joined the Royal Fusiliers soon after war was declared. After service in France he volunteered for the Royal Flying Corps, and was accepted. He was killed last week whilst returning from a flight over the enemy lines.

WORKMAN.—Lt. Charles Service Workman, M.C., Cameronians and R.F.C., who died of wounds received in action on July 20th, was the younger son of Charles Workman, M.D., 5, Woodside Terrace, Glasgow. He was 20 years of age.

Engagements.

EASTWOOD—BESTIC.—The engagement is announced of Lieut. R. Eastwood, the Essex Regiment, attached R.F.C., and Florence, only daughter of Lieut. Bestic, R.N.V.R., late of Sydney, Australia. The marriage will take place at an early date.

GOSSAGE—O'BRIEN.—The marriage arranged between Major Ernest Leslie Gossage, M.C., R.F.A. and R.F.C., eldest son of Colonel Gossage, V.D., and Mrs. Gossage, of Darincourt, Uptonheath, Cheshire, and Eileen Gladys, daughter of Brigadier-General O'Brien, C.B., and Mrs. O'Brien, of Buxted Rectory, Buxted, Sussex, will take place on October 5th at the parish church, Buxted, at 2.30.

HALL—WELLS-COLE.—The marriage of Capt. G. H. Hall, R.F.C., and Miss M. G. Wells-Cole will take place quietly at Lincoln on October 1st, leave permitting. No invitations will be sent, but friends and relations will be welcome at the church.

KNIGHT-BRUCE—AVELING.—The marriage has been arranged, and will take place quietly at St. Stephen's Church, Gloucester Road, S.W., on Saturday, October 6th, at 2.30, between Capt. R. E. C. Knight-Bruce, Royal Devon Yeomanry and R.F.C., of The Sanctuary, Crediton, Devon, and Evelyn, elder daughter of Mr. Neville Aveling and of Mrs. Neville Aveling, of St. Germans Hall, Norfolk. All friends will be welcome at the church.

Marriages.

ANNANDALE—CALDWELL.—The marriage of Mr. Arthur James Annandale, R.F.C., son of the late Mr. James Hunter Annandale, of Polton, Mid Lothian, and Miss Theodora Lindsay Caldwell, daughter of Colonel and Mrs. Caldwell, of York, on Sept. 18th, at South Ascot Parish Church, was attended by a congregation in which the Royal Flying Corps was largely represented, both by officers and men. The service, conducted by the Rev. F. J. Evans, C.F., was choral, the hymn, psalm, and sentences being sung by the Aircraft Concert Party, which formed the choir. Air Mech. Drake, the youngest Fellow of the Royal College of Organists, was at the organ, and Air Mech. Bailey sang Sydney Smith's "Ave Verum." The bride was given away by her father.

HAWKER—KNOX.—On Sept. 18th, at the Parish Church, Crossmolina, Co. Mayo, Capt. Trevor McDonnell Hawker, Royal Irish Fusiliers and R.F.C., elder son of Walter Hawker, of Anama, Clare, South Australia, and "Derrymore," Mount Lofty, Adelaide, was married to Elsie Knox, elder daughter of Ernest Henry Knox, of Greenwood Park, Crossmolina, by the Rev. A. J. Pike, M.A., Rector, assisted by the Very Rev. the Dean of Killala, and the Rev. J. F. Nash, B.A.

HAYNES—WALKER.—On Sept. 18th, at the Church of the Annunciation, Hyde Park, Capt. Charles C. Haynes, Devon. Regt., R.F.C., son of Col. C. E. Haynes, C.B., R.E., "Kerries," Brent, Devon., was married to Sheelah, daughter of the late Lt.-Col. G. Lemon Walker, I.M.S., and Mrs. Walker, Jersey, C.I., by the Rev. R. V. G. Shaw, Vicar of St. Paul's, Langlebury, assisted by the Lord Bishop of Buckingham, cousins of the bride.

Births.

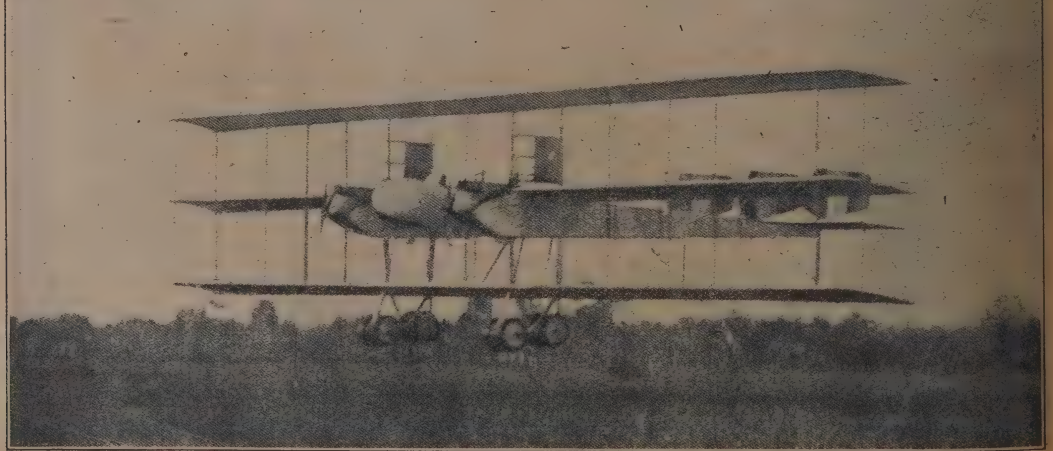
ALLEN.—On Sept. 18th, at 8, Oaklands Road, Bedford, the wife of the late Lt. Melville R. Allen, R.F.C., a son.

BILLINGHURST.—On Sept. 11th, at Stedham, West Byfleet, to Lieut. R. W. B. Billinghurst, R.F.C., and Mrs. Billinghurst—a daughter.

BUCKERIDGE:—On Sept. 10th, at 10, Silverdale Road, Hove, to Major and Mrs. Norman Buckeridge, R.F.C., a son.

COLLENETTE.—On the 20th inst., at "Summerhill," Hill Top Road, Oxford, the wife of Capt. F. de B. Collenette, R.F.C., of a son.

STONE.—On the 21st inst., at Quinbury, Braughing, Herts, the wife of Lt. S. S. Stone, R.F.C., of a son.



Sir Bryan and Lady Leighton have received unofficial news that their son, Captain R. T. Leighton, Yeomanry and R.F.C., who was reported missing on August 17th, is lying wounded in a base hospital in the German lines. Captain R. T. Leighton, who received his commission on leaving Eton in 1911, had served eighteen months in France with his regiment, and was seconded to the R.F.C. last Christmas. He returned to France last July. His machine was shot down in an air fight near the German lines on August 17th. All will wish that Sir Bryan and Lady Leighton may soon have further good news of their gallant son.

Write for our "A" List.

Mr. Warner Allen, writing from the French Front on September 24th, in the "Morning Post," says:—

A German Army Order of recent date, which has come into the possession of the French, provides a key not only to the new defensive tactics which the enemy is opposing to the Anglo-French offensive in Flanders, but to the reasons which have compelled him to resort to them. The Germans have found, says the Order, that the continuous lines constituting their front position are regularly and methodically destroyed by our artillery before an attack begins. Subterranean shelters, especially in the first and second lines, have simply proved to be traps enabling the Allies to swell their lists of prisoners. The power of defence in a defensive battle depends essentially on the precautions taken to conceal the machinery of battle from the enemy's view. This machinery—trenches, subterranean shelters, machine-gun centres, and batteries—if recorded by the photographs taken by the enemy from the air will certainly be destroyed by the enemy artillery.

"During the battle," says the Order, "all idea of having a continuous front trench line must be abandoned. This must be replaced by shell crater nests held by groups of men and isolated machine-guns, disposed like the squares on a chess-board."

Admittedly the object of all this is to enable the enemy to hide all trace of his presence from our airmen's cameras. His front is to show no sign of his existence. No eye must be able to distinguish it from No Man's Land. The thin, spidery lines across the aviators' photographs which show the lie of his trenches are to disappear. The camera in the air—the eye which guides the guns—is what the Hun has chiefly learned to fear during the summer campaign of 1917.

[Thus does an apparently insignificant accessory to aircraft change the tactics of armies. It indicates how vast a change might be brought about by the use of aeroplanes in adequate numbers and in other manners to which they are eminently suited.—Ed.]

* * *

Mr. Edmund Candler writing from Baghdad on Sept. 21st says:—

A novel use for aeroplanes was found the other day when two of our machines were the cause of the surrender of a small enemy detachment at Diwaniyeh, on the Euphrates.

The garrison had been left there in charge of sick and stores by the Turkish Euphrates force in the second week of March during their retirement from Samawa to Ramadieh at the time of our occupation of Baghdad. They held out for some months at Diwaniyeh in the hope that the Euphrates might be reoccupied by the Turks. At the end of July a number of the garrison surrendered to the townspeople, and were handed over to us, but a single officer and some 30 men refused to yield until the aeroplanes came and bombed the house in which they had taken refuge.

The lieutenant and his detachment formed a last batch of isolated Turks who have hung out in the remote districts between Nasiriyeh and our posts farther north on the Euphrates.

* * *

A military balloon passed over Brixton about 6 p.m. on Sept. 20th at a low altitude. It continued to descend, and eventually came to earth in some gardens off Croxted Road, Dulwich. The balloon carried no crew. This appears to have been the balloon from which a man fell in Richmond Park. When last seen in that neighbourhood another man was still sitting in the rigging, but there was no car.

FRANCE.

Official Communiqués.

Sept. 18th.—Yesterday five German aeroplanes were brought down in air fighting or by the fire of our machine-guns.

Sept. 21st.—During Sept 19th and 20th two German aeroplanes were brought down, and eight other enemy machines were obliged to land in a badly damaged condition.

Army of the Orient.—British aviators bombarded the enemy establishments to the north of Doiran.

Sept. 22nd.—Between September 10th and 20th, 15 German aeroplanes and a captive balloon were brought down by our pilots.

Twenty-nine German machines were driven down damaged within their own lines as the result of aerial fighting.

Army of the Orient.—British aeroplanes have bombarded enemy establishments in the neighbourhood of Demirhissar (Struma front).

Sept. 23rd.—During yesterday our chaser aeroplanes had numerous fights. Eleven German aeroplanes and one captive balloon were destroyed by our pilots.

During yesterday and during last night our aviators showered bombs on the munition depots of Donon (Vosges), the factories of Hagondange (north of Metz), and the railway stations of Chambley, Thionville, Luxembourg, Metz, Woippy, Maizières-les-Metz, etc. (in the Briey Basin).

In Belgium they bombarded the railway stations of Staden, Roulers, and Cortemarck.

Sept. 24th.—Enemy aeroplanes last night bombarded the region north of Bar le Duc. Several bombs fell on a group of German prisoners, two of whom were killed and 17 wounded. During the day of September 23rd our pilots brought down six German aeroplanes.

GERMANY.

Official Communiqués.

Sept. 18th.—Senior Lieut. Berthold again shot down two opponents in aerial battle.

Sept. 18th.—Our enemies undertook several bombing raids on September 16th against South German territory. Stuttgart, Tübingen, Freudenstadt, Oberndorf, Stingbert (?), Saarbrücken, and Colmar were attacked. Near Stuttgart one soldier was slightly wounded. At Freudenstadt and Colmar damage was done to buildings. None of the other attacks caused either losses in killed and wounded or material damage. Three of the enemy aeroplanes were shot down on German soil.

Sept. 19th.—Yesterday 16 enemy aeroplanes were shot down. Vice Sgt.-Major Thom shot down three opponents, and Lt. Thuy two.

Sept. 20th.—Twenty enemy aeroplanes were shot down. Vice-Sgt. Major Thom again brought down two opponents in aerial battle.

Sept. 22nd.—The aviators took a prominent part in the fighting in Flanders. During the last two days 39 enemy aeroplanes and two captive balloons have been shot down. Three of our aviators fell. Ober Lt. Schleich gained his 21st and 22nd aerial victories. Lt. von Bülow shot down his 21st opponent; Lt. Wüsthof and Lt. Adam both shot down two enemy aviators.

Sept. 23rd.—The enemy lost 14 aeroplanes yesterday and one captive balloon. Sgt. Thom again brought down two aviators in aerial battle.

Yesterday morning an English monitor, assisted by aerial observers, bombarded Ostend. A few shells struck the Cathedral, in which early Mass was being held. Several Belgians were killed and 24 seriously wounded. The monitor was driven off by the fire of our coastal batteries.

Sept. 24th.—Temp. Sub-Lieut. G. S. Boston promoted to temp. Lieut., R.N.V.R., with seniority Sept. 21st.

* * *

A Berlin telegram of Sept. 19th announces that Lt. Aviator Curt Wolff was killed on Sept 15th. He had won the order Pour le Mérite, and was latterly leader of air squadron No. 11, which was for a long period led by Cavalry Captain Baron von Richthofen.

Lt. Wolff was well to the fore among German aviators last May, when, on the 13th of that month, he was officially reported as having brought down his 30th enemy opponent. The last mention of Wolff is in the German report of July 7th, when he was credited with his 33rd victim.

RUSSIA.

Official Communiqués.

Sept. 18th.—Our pilot Komarovsky, while making a reconnaissance, was attacked by an enemy aeroplane, which he brought down in the region of Lokatchi (in the direction of Vladimir-Volynski).

Sept. 21st.—On September 19th on the South-Western and the Rumanian fronts there were several aerial engagements and our aviators brought down four machines in the German lines. In the region of Novo Selki our aviator Vassilevsky brought down an enemy machine and the occupants have been made prisoners.

In the region south-east of Kowel our aviators dropped a hundredweight of bombs on the enemy camps in the villages of Cheremockno and Jino.

Sept. 24th.—On September 21st, in the Kowel region, our aviators bombarded the enemy rear and stores at Jino, Melnica, and Nugel, dropping about a hundredweight of bombs. Several fires broke out.

West of Husiatyn, Lieut. Jachello brought down an enemy machine, which fell in the region of Chabarovka.

On September 20th, in the region of Kezdi-Vasarhely, the Roumanian aviator Capt. Mihaletti engaged an enemy machine and forced it down into the enemy lines.

In the region of the Lower Danube our hydroplanes successfully dropped 18 bombs on the enemy lines.

Sept. 24th.—In spite of the misty weather the activity of our aviators was very great.

We bombed the enemy hutments in the direction of Leke in return for the bombing by enemy aeroplanes of some of our cantonments.

* * *

A message from Petrograd, dated Sept. 16th, states that the Russian aviator Smolianinoff has just arrived at Odessa after a notable trans-Balkan flight, in the course of which he flew from the Russian town of Bolgrad to Salonika and back, and then on to Odessa. Setting out for Bolgrad, a small town north of the Danube, in Bessarabia, the aviator made a non-stop run to Salonika, where he visited the Russian camp, and then returned direct to Bolgrad, flying at an altitude of 3,000 metres (about 10,000 ft.), covering the distance of 460 miles in the record time

of eight hours (sic). On arrival at Bolgrad, Smolianioff took up a passenger and continued his journey safely to Odessa.

ITALY.

OFFICIAL COMMUNIQUÉS.

SEPT. 22nd.—Last night three of our airships carried out an offensive action on the enemy encampments in the Chiapovano valley (north-east of Gorizia), the station and hutments of Grahova (five miles east of S. Lucia Polmino) and the railway works north-east of Prosecco (Gulf of Trieste). The operation, rendered difficult by a sudden change in atmospheric conditions, which became decidedly adverse, and by the enemy's most intense and well-directed fire, was brilliantly executed, and the objectives were bombarded with four tons of high explosive bombs.

SEPT. 23rd.—Last night one of our airships navigating in unfavourable atmospheric conditions returned to the Chiapovano valley and renewed the effective bombardment of the enemy encampments there.

SEPT. 24th.—The railway line in the Bazza Valley (east of Tolmino) was yesterday the objective of our air forces. In the morning one of our bombardment squadrons well escorted arrived almost by surprise over the railway station of Grahovo [about five or six miles east-south-east of Tolmino] at a moment when intense railway movement was going on, and four tons of bombs were dropped there. In the night an airship by dropping numerous high-explosive bombs greatly damaged the establishments in the neighbourhood of Podmelec [midway between Tolmino and Grahovo]. At the same time another airship once again bombarded the numerous enemy troops in the Chiapovano Valley.

Two enemy machines brought down by our aviators fell in flames at Cotici (east of S. Martino del Carso) and east of Kal (Bainsizza Plateau).

AUSTRIA.

From Switzerland comes the news that the 31st Galician Infantry, which was being rushed up to reinforce the Austrian forces on the Carso, was almost completely wiped out by the train transporting it being bombed by a Caproni squadron, which, having derailed it, got in some good work.—T. S. H.

BELGIUM.

A report from Amsterdam, dated Sept. 18th, states that it is learned from the frontier that the Germans throughout Flanders are busily engaged in constructing new aerodromes or enlarging existing ones. Particularly large ones are being erected at St. Denis, Westrem, where the staff numbers 700 men.

The Allied aviators are continuing their raids with good results. During the last raid several military trains were hit, among them being a munition train, which exploded. There were many victims.

HOLLAND.

A German aeroplane landed on the morning of Sept. 19th near Breskens, in the province of Zeeland. The aviators were interned.

U.S.A.

According to the Washington correspondent of the "New York Herald" (Paris edition), Sept. 19th, some Italian aviators, who are now in the United States, are soon to attempt a flight over the Atlantic with Caproni machines. They are practising by means of long flights from Newport News to Washington, returning via New York.

[It is satisfactory to learn that Italy is so well equipped with aviators and aeroplanes, that she can undertake experiments of a purely sporting and scientific nature.—Ed.]

AVIATOR'S PRESENCE OF MIND.

From the "Japan Times," July 26th, 1917.

Lieuts. Matsuoka and Noguch had a singular experience on Monday in their making a practice flight to Tokorozawa. The two aviators, one of whom was Lieut. Matsuoka, a flying coacher, went up to the sky early that morning in an aeroplane, and when they came over the placed named Ushinuma, in the village of Matsui, Iruma-gun, a little distance from the aerodrome at Tokorozawa, the motor of the machine suddenly went wrong and the aeroplane dropped to the height of 400 metres from that of 600 in an instant, which greatly surprised Lieut. Matsuoka, who, then, however, with the happy presence of mind, started the gliding on air, until he succeeded in landing the aeroplane on the top of a certain huge tree below in the neighbourhood, thus saving the machine from a certain destruction.

ARTIFICERS WANTED.

To serve with the Royal Flying Corps, Royal Artillery and other Technical Corps of the Army.

Skilled workmen of certain types, which are enumerated below are most urgently required for service as Artificers in the above Corps.

The types in question are :—

Fitters	**Watch and Instrument Repairers**
Turners	**Draughtsmen (engineering)**
Coppersmiths	**Draughtsmen (constructional work)**
Smiths	**Riveters**
Acetylene Welders	**Caulkers**
Planing Machinists	**Boilermakers**
Slotting Machinists	**Frame Benders (ship)**
Grinding Machinists	
Electrical Instrument Makers	
Electricians	

(1) If you belong to one of these classes you may be of more service to your country as an Artificer in a technical corps of the Army than in civil employment; and you can, if you so desire, volunteer your services in that capacity by signing the Army Artificer Volunteer undertaking (Form A.A.4) at the nearest Employment Exchange. By doing this you undertake to serve as an Artificer in a technical corps of the Army, whenever you may be called upon to do so by the War Office acting in consultation with the Ministry of Munitions.

(2) Having signed Form A.A.4, you should return to work with your employer and await further instructions. Should you be found suitable, and should the Ministry of Munitions consider that you can be spared from your present work, you will in due course receive a calling up notice and instructions to report at Woolwich or elsewhere for your Trade Test. This notice will be issued to you by the Munitions Area Recruiting Officer if you are working with a firm covered by the Schedule of Protected Occupations, and by the Recruiting Officer if you are not. If you pass your Trade Test you will be posted to one of the technical corps. If you fail to pass you will be returned to your previous employer.

(3) It is possible that you may possess Army Form W.3476a (the red card). This is no barrier whatever to your enrolment for service as an Artificer. (See Schedule of Protected Occupations, Note 7a). Indeed, most tradesmen of the type and degree of skill at present required in the technical corps are likely to be holders of this card. Those who possess the red card and pass their Trade Test will have it withdrawn from them by the Military Authorities at the Trade Testing Station. Those who possess it and fail at their Trade Test will be returned to civil employment in possession of the card.

(4) If you do not receive instructions to report for Trade Test shortly after your enrolment as a Volunteer you will know that this is either because you do not meet the immediate requirements of the Army, or because the work upon which you are at present engaged is too important; but the fact that you are engaged on important War Work should by no means restrain you from enrolling.

(5) Special rates of pay prevail in the technical corps. They are higher than those for Infantry, and may be ascertained in detail from any Local Employment Exchange. It is hoped that numbers of skilled men will embrace this opportunity of placing their skill at the disposal of the nation with the certainty that it will be employed to the best advantage.

THE TIELOCKEN

Naval or Military Catalogue Post Free.

THE TIELOCKEN

The collar can be worn (1) open, as illustrated; (2) closed like The Burberry; or (3) turned-up, when it forms a close-fitting storm collar that prevents any possibility of wet trickling down the neck

Every Burberry garment is labelled "Burberrys"

ensures that every vulnerable part of the body is doubly covered, and combines with its workmanlike design such effective weather-resistance that blizzards and anything in the way of wet can be faced with an assurance of immunity from discomfort.

Unlike coats loaded with oiled-silk or rubber, whilst efficiently protective, it is self-ventilating, and free from all unhealthy heat.

To make security doubly sure, it is lined with Proofed Wool or soft Camel Fleece, which, in addition to increasing its defensive powers, makes it the warmest and most comfortable coat available for air-work.

Another advantage of THE TIELOCKEN is its quick adjustment. A strap and buckle holds it securely — no buttons to fasten or catch in wires.

Complete R.F.C. and R.N.A.S. Kits in 2 or 4 Days or Ready for Use.

ON AN IMPERIAL AIR SERVICE

Despite the expressed desire of those most entitled to speak on the subject that the Press should refrain from discussing any alteration in the organisation of the Flying Services, the London papers have for the past two or three weeks been hinting at or arguing over that very subject, and during the past few days whole articles have been devoted to the subject of an Imperial Air Service, whatever the various writers may understand by the phrase.

The views of many of those best qualified to judge the subject have been reflected in this paper on sundry occasions in the past three or four years. Some four or five weeks ago, when certain political influences were at work to achieve unification of the Flying Services, the subject was again discussed; but, as public interest has been so considerably concentrated on the idea of a Single Air Service since then, it may be well to restate briefly the gist of the arguments then set forth.

Primarily, a soldier is a soldier, whether on his feet, on horseback, or in the air. Secondly, a sailor is a sailor, whether on a ship, on land, or in a seaplane.

It takes five or six years to make a soldier. Our Army to-day is no contradiction of the statement. Officers and men alike have been trained in a few months to carry out one small section of the work of which a trained soldier should know the whole. And the novices are held together by a stiffening of men with two, three, five, and ten years' service, where the lower ranks are concerned. Moreover, they are commanded by men with twenty, thirty, or forty years' experience.

Similarly in the Navy, a naval officer is caught young—too young, because, owing to his entering the Navy as a child, he lacks general education—and it takes eight or ten years to make a sailor of him, even if, owing to the grooviness of his training, he is then capable of doing anything outside his own particular job.

On the other hand, an aviator is considered by some official authorities to be fit for active service after seventeen or eighteen hours in the air, and even by the more cautious thirty hours' air experience is considered sufficient. Leaving out the question of mere piloting—which is rather easier than learning to drive a fast car properly—any intelligent being should be able to learn all there is to learn about air war, its strategy, tactics, mechanisms, and so forth, in six months, as against the six years of a soldier.

All the Difference.

Now, to be a thoroughly efficient military aviator, as distinct from mere air scrappers or bomb droppers, a man should be a trained soldier. For if he does not know most of what a soldier on the ground should know, he can be of little use on reconnaissance, or at anything else except fighting and bombing.

Similarly, a naval aviator should be a technically trained naval officer who happens to fly, as part of his naval job.

Therefore it seems fairly obvious that in any properly thought-out scheme for the efficient utilisation of aircraft in war, all seaplane work, or aeroplane work from ships, should be done by *pukka* naval officers, who would be an integral part of the Navy, and not mere intruders on ships to be treated with the same contempt or indifference as is suffered by that gallant and highly efficient regiment, the Royal Marines. Naval aviators should be Lieuts. (A) R.N., and not members of a minor organisation dressed in an imitation naval uniform. If their services are necessary to the Fleet—as some naval officers are at last beginning to agree—then naval aviators are fit to be naval officers.

As to the Army, the trained soldier, even of the most conservative type, did not take long to realise the value of aeroplanes. Being an educated man of the world, he soon saw that a great new weapon was at his hand. But for the politicians, with Mr. Asquith and his "Wait and see" policy at their head, the Army would have had a flying corps ten times as large as it had at the outbreak of war. The genuine military aviator is proud of being a soldier, and very rightly, for the British officer of the Old Army is the finest of God's creations up to the present, and many of the young officers of the right class who have joined since the war have come very close to the high level of the pre-war Army.

The Unitarian Faith.

Naturally, therefore, the best class of officer does not want to leave the Service in which he has already won honour and distinction, and to which he is attached by every possible tie of affection, to embark in some brand-new Service such as seems to be desired by those holding the "Unitarian Air Faith." One would sympathise with any officer who gave up his temporary rank in the R.F.C. and reverted to his regimental seniority rather than change over to a different Service: provided always that he did not honestly think that his experience of aviation might be of such value to the country, in preventing the new Service from making a fool of itself, as to demand that he should sacrifice his personal feelings to pure patriotism.

The Trinitarian Alternative.

However, apart from the R.F.C. and R.N.A.S., as was pointed out weeks, months, and years ago, there is room for a separate Air Service, composed of air pirates pure and simple—probably, in fact, not very pure, and a long way from simple. There are a vast number of adventurous young men who are not really sailors or soldiers, and who are not bound to the Navy or Army by any ties of family tradition, or personal education, who are at the moment in naval or military uniforms without any particular affection for either. They would

be just as happy in an Imperial Air Service, with sky-blue jackets and puce pants, as in any other. And so long as they had their fill of fighting and bomb dropping, and got the best possible machines and weapons, they would not care whether they were commanded by General Booth or the King of Siam.

Therefore there is quite good reason for forming an Imperial Air Service, drawn from the Five Nations and the Seven Seas, simply and solely as a raiding and fighting service. Only, if it is going to be a true Imperial Air Service, the various self-governing sections of the British Empire which contribute men to this service should also contribute money and machines to its upkeep, in proportion to the number of men which they supply, whether as pilots, passengers, or mechanics. If it is Imperial, then the Empire should pay for it, and the whole financial burden should not fall on the unfortunate taxpayer who happens to exist in the British Isles.

Australia, I believe, already pays the personnel of her own squadrons of the R.F.C., but I do not know whether she pays for their machines and weapons and ammunition. If not, she ought to do so. Canada, though she has sent us many of our finest pilots both R.N.A.S. and R.F.C., has not yet raised a Canadian squadron, but doubtless in an Imperial Air Service she would be wishful to have distinct squadrons of her own. Such an arrangement would lead to a healthy spirit of emulation, and thus to increased effectiveness.

Yet Another Alternative.

There is yet another alternative, in which all the flying people might be called "The Imperial Air Service," though divided into three distinct sections, one for the Navy, one for the Army, and a third for air raiding and fighting. Personally this does not seem to me as satisfactory as three separate services, entirely independent of one another in command.

In the first place, if all three branches had to wear the same uniform, which would be neither naval nor military—say, for instance, as has been suggested in some quarters, the present R.F.C. uniform done in Navy cloth—the I.A.S. personnel would be with the Army but not of the Army, in the Fleet but not of the Navy. This would only be a resuscitation of the old idea of 1912, of a Royal Flying Corps, with Naval and Military wings, the "Aeroultramarine" at which one jested five years and so ago. Still, it would be better than lumping the lot and leasing men and machines as they might be required by either of the Senior Services.

The Real Way Out.

As a matter of fact, very little improvement on the present system is required. The R.N.A.S. should give up all its seagoing machines and their personnel to the Navy, which should absorb such personnel into the Navy proper and the R.N.A.S. should cease to exist.

The R.F.C. should remain as it is—an integral part of the Army, with the Army's discipline and traditions. Pilots and observers might be altogether R.F.C., or they might be seconded from other regiments as at present, according to the custom between other branches of the Army.

The shore-going machines of the R.N.A.S. and their personnel should be taken away from the Navy and made the nucleus of the Imperial Air Service. In time the I.A.S. will grow to be as big as the Army, and many times bigger than the Navy, for on it will depend the freedom of this country from real invasion in the next war—say 20 or 30 years hence, or perhaps less. Therefore it offers a life's work to those who choose to transfer to the I.A.S. from the R.N.A.S., or the R.F.C.

Meantime the arguments between the Unitarians as representing belief in a single service, one and indivisable, and the Trinitarians, representing the idea of three distinct services, with the present Air Board to regulate supplies and prevent "cornering" by any one service, reach the vehemence of a religious argument. The violence of the debaters recalls Gibbon's humorous descriptions of the debates between Nicenes, Aryans, Nestorians, Jacobeans, Gabellians, and other assorted dogmatists of the early days of Christianity.

The Matter of Ranks.

The organisation of the I.A.S. should be on distinctly military lines, rather than on Naval lines, and there seems no reason why military ranks should not be retained, if only to avoid confusion when the two services meet, for the I.A.S. and the Army would naturally be more closely in touch than would the Navy and the I.A.S., seeing that the work of the I.A.S. would be almost entirely over land.

There seems no real need to invent comic new titles for the different ranks. Everyone knows where he is with a General, a Colonel, a Major, a Captain, or a plain Mister in the case of a subaltern, and it is the little matters of conversational titles which really matter most.

The R.F.C. has been wise in sticking to its military ranks for conversational use, and using its R.F.C. titles only as gradings.

The Admiralty has been characteristically unpractical in making the special titles of the R.N.A.S. into actual ranks, and it has complicated the difficulty with its weird stars and stripes and dickie-birds and things. As a result, on occasion one finds Flight-Commanders with two stripes and a star, Squadron-Commanders with two stripes and two stars, or perhaps two and a half stripes and two stars, and Wing-Commanders with three stripes, no stars, and a brass hat, all addressed impartially as "Commander." Or, in air stations themselves, one finds junior officers and ratings talking to and of Squadron-Commanders as "Mister So-and-So," which conveys to a stranger to the station no idea of the officer's rank.

In the Army, where everything is clear, concise, and practical, there can be no ambiguity. A Squadron-Commander R.F.C. is a Major, he wears a crown on his cuffs or shoulder straps, and his wings on his chest, and whether you see him or hear someone speak of him you know what he is.

The R.N.A.S. goes and complicates matters still further by putting its dickie-bird and stars on one cuff only, so that when you meet a personage in blue with two stripes, you have to walk round him to the right side—which I believe is his left—to see whether he is a *pukka* Lieutenant R.N., a Flight-Lieutenant R.N., a Flight-Commander R.N., a Squadron-Commander R.N., a mercantile Marine officer, or a kinema attendant.

To Avoid Complications.

It is to be hoped that if and when the Imperial Air Service arrives it will avoid these silly complications. Even if it goes right away from the Army uniform and adopts the German "field-grey," which would be the most sensible thing of the lot, it should stick to military rank badges, if only because everyone knows their relative value. Few know the value of Naval stripes, and fewer still know the R.N.A.S. stars. Which is so for the good and sufficient reason that all the friends and relations of some 7,000,000 men are interested in the Army, only those of half a million or so are interested in the Navy, and only those of a few thousands are at all concerned about the R.N.A.S.—despite the Admiralty's gallant efforts to advertise it in special communiqués.

It is particularly to be hoped that no new ranks will be invented specially for the I.A.S. It is bad enough to have to remember that a Captain R.N. is three steps in rank higher up than a Captain R.E., without introducing further complications. Army ranks and R.F.C.

gradings ought to be good enough for any new Service, whether it includes the other two or is additional.

For Heaven's sake do not let us have portmanteau or freak words invented for new ranks, such as "Air-miral," or "Squadleader," or "Flighter," or any other wild things that look like telegraphic addresses of aeronautical accessory makers. People who are not content with the time-honoured ranks of the Army are quite capable of such atrocities.

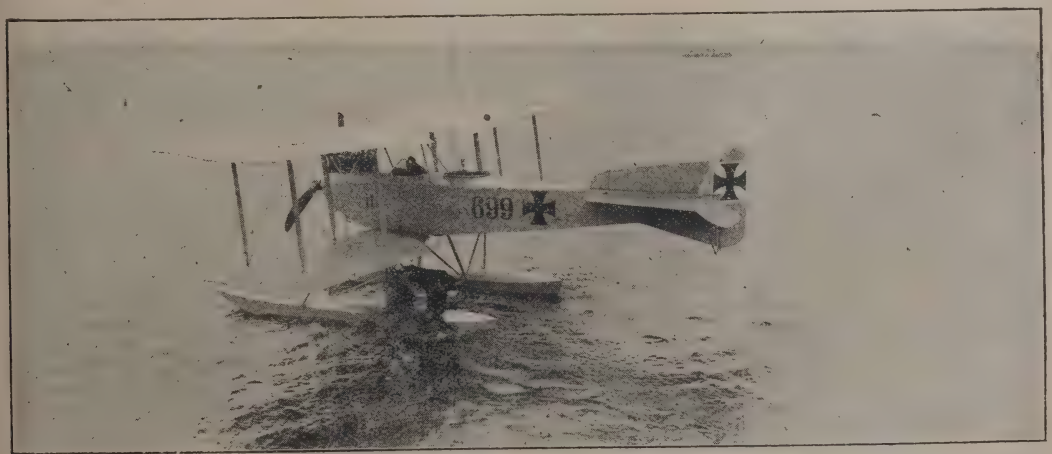
Command Rumours.

Finally, there is the question of the High Command of such a force as an Imperial Air Service. So far as I can see, if any I.A.S. is to include the existing flying Services, I cannot see any reason to go outside them for the highest officers. There is precious little the matter with the people who are doing the actual work of running the Services to-day. But if the I.A.S. is to be a wholly separate show, for raiding and fighting only, it is perhaps another matter.

The name of General Smuts has been frequently mentioned for such a post. Anyhow, he is a man of foresight, a fighting man, and a man with a trained legal brain capable of tackling and defeating the intrigues which would be bound to arise in a service composed very largely of young and ambitious men.

Another name mentioned is that of Rear-Admiral Mark Kerr. Why Admiral Kerr was not put in command of the R.N.A.S. years ago is a matter which would bear discussion. He is senior to any naval officer who has ever displayed any interest in aeronautics. He is himself a pilot of real ability. He is a born leader of men. He has the gift of making plenty of enemies, which is always a sign of strength of character. He is what few naval officers are, a man of the world and a diplomatist. What he does not know about the Courts of Europe is worth little, but he is equally a sailor of daring and success. And, above all, he believes firmly in the importance of the mastery in the air as the only salvation and protection of this country. There might be many worse choices for the command of an independent Imperial Air Service than Admiral Kerr.

General Capper's name has also been mentioned. As a Colonel R.E., General Capper ran the Balloon Factory at Aldershot, where he, alone among those having authority, encouraged the late Mr. S. F. Cody in his work with war-kites, airships, and aeroplanes. He took part personally in experiments with the Dunne gliders at Blair Athol, and later with the Dunne aeroplanes at Eastchurch and Lark Hill—in fact, I believe that, after he left the aeronautical branch of the Army, he actually bought and paid for a Dunne machine, with which to experiment by himself. At any rate, I remember him taxying furiously on a Dunne monoplane at, I think, the time of the Military Trials of 1912. Since then, however, General Capper has not been in close practical touch with aviation. He has done excellent work in this war, and, one gathers, is doing work for which his training eminently fits him. He is an officer in whose sound judgment everyone trusts, but he is a Sapper, and hardly such a "thruster" as is needed to make an Imperial Air Service so thoroughly offensive (to the enemy *bien entendu*) as it should be.



Probably there are many other officers of high rank who would like the job, but one does not recall any with experience of aeronautical affairs who are sufficiently senior for the command. Anyhow, we shall probably hear to-day, or to-morrow, or next week, or next month, or perhaps next year, what the Government has decided to do about a serious aerial offensive.

The Work of an Imperial Air Service.

Our defensive service is in such good hands that there is no need to discuss it. It is our offensive service which needs intensive cultivation. So far the so-called offensive raids on German aerodromes in Belgium have been purely defensive. They have merely been calculated to deplete the forces of German aircraft assembled for the invasion of England, or to annoy German naval forces in Belgian ports, and so save the Dover Patrol a certain amount of trouble.

If the R.N.A.S. in Flanders had concentrated all their efforts on Germany's aircraft in Belgium a year ago, with adequate forces under a keen and energetic leader, there would be no raids on London at all to-day, for by this time we should have had an overwhelming mastery of the air in that area. But though that area is really where our London defences should begin, it is not part of the London defences, so no blame attaches to our defence forces for such enemy aeroplanes as reach this country.

Our real aerial offensive only begins to the east of the German Frontier. Apart from fighting over Belgium and France on the way to Germany, the work of the Imperial Air Service will really begin when it drops its first bomb on a German city. Until then, if it comes into existence in response to popular clamour, it will merely be obtruding itself into the legitimate work of the two Senior Services.—C. G. G.

A German Seaplane of neat type, with evident Howard Wright influence in float design. The observer is on the heel of the port float, giving a hand to a comrade swimming over from a capsized seaplane in the vicinity.

THE AERONAUTICAL HISTORY EXHIBITION.

Mr. Asquith opened at Leeds Town Hall, on Sept. 27th, the Air Services Exhibition organised by the Countess of Drogheda, in aid of the Flying Services Hospitals and Viscount French's War Charities. He said he accepted with the greatest pleasure the invitation which Lady Drogheda was good enough to give him to take advantage of his visit to Leeds to attend the opening of her exhibition. He had had the privilege of going over it some months ago in London, and he believed it had since been considerably augmented and enlarged. As they went around it they would be able to trace, little by little, and one after another, the steps—often the slow and stumbling steps—by which man had achieved, or, at any rate, was achieving, the conquest of the air.

When they had traced the process they would be as strongly impressed as he was with the foresight, pains, and skilful arrangement and organisation which Lady Drogheda had brought to her task, and which enabled him, without any suspicion of flattery or exaggeration, to say that it was one of the most remarkable contributions that women's work had made to the service of the war. (Hear, hear.)

"I am old enough to remember," Mr. Asquith continued, "the days when ballooning, as it was then called, was considered to be a rather eccentric and decidedly dangerous pastime. But the type of aircraft which still goes by that generic name has now become, as we all know, an indispensable part of the apparatus of war. I say nothing of the Zeppelin, save that, except perhaps for scouting purposes, it has turned out to be, in my judgment, a costly failure. [Which shows how much Mr. Asquith knows about munitions. And yet he at one time was permitted to misdirect the war policy of this unfortunate country.—Ed.]

"But the captive balloon—the sausage as the soldiers call it—is an invaluable adjunct in these days to any considerable fighting force. Only a week ago I was somewhere between Ypres and the Messines ridge, near where the splendid fighting of which we are reading again to-day was going on, and I saw in the sky a row of some twelve or fifteen of those captive balloons, all making their observations at different altitudes, heavily shelled at times, but I am glad to say unsuccessfully, by the Germans, and each protected in case of disaster by its parachute. That is a wonderful sight. [Of course, Mr. Asquith would be the last person to know of all the obstructions which were put in the way of introducing the kite balloon into the British Army and Navy. Did he ever see the correspondence between a distinguished artillery officer and the War Office on the subject? Incidentally, how does one protect a kite-balloon with a parachute?—Ed.] Even more remarkable and more rapid has been the development of the other type of craft, heavier than air, that we know as aeroplanes. The Duke of Wellington was once asked, I think in his old age, what had been his greatest difficulty as a general, and he said, 'I spent the most of my life in trying to find out what was going on upon the other side of the hill.' [That presumably is why, before the War, Mr. Asquith, as Premier and First Lord of the Treasury, refused money for the development of aircraft.—Ed.] His successors who command the armies of to-day have no such anxiety or solicitude, and why? Because of the aeroplane, with its photographic apparatus, its wireless, its capacity to soar to enormous heights, and disclose and reproduce for the information of the general and his staff every feature of the contour and disposition of the enemy. [A delightful phrase. Imagine an observer officer sending in a sketch and report of the contour and disposition of a fat and sulky Hun! And, anyhow, does one make a contour map from above?—Ed.] Equal in importance—some military experts would say more important in these days of artillery warfare—is the service which the aeroplane renders to the guns, which are able to aim with miraculous precision at absolutely invisible targets and over almost inconceivable ranges. In fact, it is no exaggeration to say—and I am sure all the military experts who are present will agree with me—that the air service has become the eyes of the Army, and to a large extent also of the Navy.

"There are other forms of aerial activities upon which I need not dwell, and with which those of us who live in London are becoming daily or nightly more familiar. I will only say they do not alarm us in the least, and that we have complete confidence in the powers of our own airmen and land defences to keep them at bay. [Which sounds very pretty in Leeds. One suggests that Mr. Asquith should take a trip on the tubes after a "take cover" warning has been issued.—Ed.] Let me say before I sit down, for it is, after all, the abiding reflection that ought to be left in our minds after visiting such an exhibition as this, that we cannot see and realise the meaning of all that is gathered together here without feeling a profound and fervent admiration for the gallant men who are risking their lives every day and every night in this most hazardous service for the cause of their country, and to whom, and to whose skill and to whose devotion the Navy and the Army, and not only them, but the country and the Empire, owe an immeasurable debt of gratitude." [If Mr. Asquith had let them have cash four years ago, instead of owing them a debt now, the aforesaid "gallant men" would be in a far better position.—Ed.]

Mr. Rupert Beckett proposed a vote of thanks to Mr. Asquith, which was seconded by Mr. J. S. R. Phillips.

Mr. Asquith, in reply, said: "You owe me no thanks at all. [Hear! Hear!!—Ed.] What I have come here to do has been a pure pleasure. Mr. Phillips has spoken of soaring as a politician, but if you look round this exhibition you will find that some of the objects suggest to you the counterpart of soaring, which is sinking, and politicians spend their unhappy lives oscillating between those two positions. (Laughter.) Lady Drogheda suggests to me that they are lucky if they can get a parachute to make safe their occasional descent. (Laughter.) [The pity is that they do.—Ed.] I hope that you, my Lord Mayor, and your fellow-townsmen will make the most of your opportunities here, and that particularly the young people in the schools will be able to see this exhibition, and will realise all it means for us, for the Empire, and for the future. (Cheers.)

The Lord Mayor of Leeds presided at the ceremony, and among those present were Mrs. Asquith, the Countess of Drogheda, and Sir Algernon and Lady Firth.

CAPTAIN LAUREATI IN LONDON.

Prince Borghese, Italian Chargé d'Affaires, speaking on Sept. 26th at a banquet in honour of the famous Italian aviator, Capt. Giulio Laureati, the hero of the non-stop flight from Turin to Hounslow, said: "That so short a time should have been taken in the journey was a symbol of the unceasing, auspicious progress which the peoples of the two countries were accomplishing in their cordial Alliance. Those few hours of flight seemed, indeed, as it were, to shorten, if not quite to abolish, the distance dividing us." "On the auspicious occasion which unites us," he added, "I am glad to have the honour to represent the Government of His Majesty the King of Italy, in order that I may send a greeting and good wishes to the hardy explorers of the air, to the champions of aviation of the Allied nations."

* * *

On Sept. 27th Capt. Laureati was entertained to a charming and entirely informal lunch by Capt. Darcy-Baker, the head of the London Fiat firm. Oddenino the Inimitable surpassed himself in producing a war-meal for his distinguished compatriot. Even the famous dinner given recently by the putative Thousand Million Pound Syndicate to the Press of England did not beat it for good taste—in both senses of the word.

Lord Montagu of Beaulieu in proposing the health of the distinguished guest referred felicitously to the lesson which his flight taught the people of this country as to the possibilities of modern aeroplanes, both for the purposes of bombing German towns, and for postal and passenger services after the war. Afterwards he presented to Capt. Laureati, on behalf of Capt. Darcy-Baker and his friends a handsome silver box engraved with a map of the flight.

Capt. Laureati, speaking in excellent French, gracefully acknowledged the compliments paid him, and referred to the good comradeship which existed between the soldiers and aviators of the Kings of Italy and England. Baron Mayor Deplanche, of the Italian Commission in England, also spoke for the amicable relations between the two countries.

The Flying Services were well represented by three Brigadier-Generals R.F.C. and two Wing-Commanders R.N.A.S., besides sundry junior officers. Several civilians were also honoured by inclusion among the guests, who were composed entirely of personal friends of the so-excellent host.

* * *

On Sept. 28th Capt. Laureati was again entertained at lunch, this time by the Royal Aero Club. The affair was quite informal, and only some thirty people were present. Col. Holden, the Deputy-Chairman of the Club, presided, and proposed the health of the guest of the day, whose seven-hour flight, he said, marked an epoch in aerial transport, by showing that Turin and London are closer together by air than Paris and London are by rail and steamboat.

His Excellency Baron Mayor Deplanche, who has represented Italy at Washington, and at Constantinople in pre-war days, in a singularly diplomatic speech, remarked that he saw before him on the table the flag of England and the flag of Italy, and between them a cradle of flowers. He wished that for all time nothing less charming should come between the two flags. Occasionally flowers had thorns, but such thorns must never be allowed to grow between Italy and England.

Incidentally Mr. Frisby, the steward of the Aero Club, deserves due credit for the tasteful decoration which inspired so happy a sentiment in so distinguished a diplomat. And furthermore, he deserves credit for putting on a lunch which would have done credit to the best of fashionable hotels. One fears that if Capt. Laureati is entertained to many more such meals he will return to Italy with the impression that the German submarine campaign is of no consequence whatever, and that we can well afford to feed as well as arm all our Allies—except in the matter of aircraft supplies, in which, of course, his sentiments are precisely the reverse.

FROM THE COURT CIRCULAR.

BUCKINGHAM PALACE, Sept. 26th.

The following Officers also had the honour of being received by the King, when His Majesty invested them with the Insignia of Companions of the Order into which they have been admitted :—

THE DISTINGUISHED SERVICE ORDER AND THE DISTINGUISHED SERVICE CROSS.

Flt. Comdr. Herbert Brackley, R.N.A.S.

THE DISTINGUISHED SERVICE ORDER.

Lt.-Col. Percival Wise, Royal Warwickshire Regt. and R.F.C.

* * *

The King then conferred Decorations as follows :—

THE MILITARY CROSS.

Lt. Hamilton Blofeld, R.F.C.
Capt. William Buckingham, R.F.C.
Caapt. Edmund Cahusac, South Staffordshire Regt. and R.F.C.
Capt. William Thomas, Gen. List and R.F.C.
Capt. Lewis White, Gen. List and R.F.C.
Lt. Wilfred Cox, Gen. List and R.F.C.
Lt. Archie Lutyens, R.F.C.
Sec. Lt. Maurice Benjamin, R.F.C.
Sec. Lt. Thomas Luke, R.E. and R.F.C.
Sec. Lt. Herbert Tansley, K.R.R. Corps, attd. R.F.C.

His Majesty subsequently proceeded to the Forecourt of the Palace, and decorated (amongst others) the following with the Victoria Cross :—

Sec. Lt. Gilbert Insall, R.F.C.

For most conspicuous bravery, skill, and determination. He was patrolling in a Vickers Fighting Machine, with First Class Air Mechanic T. H. Donald as gunner, when a German machine was sighted, pursued and attacked. The German pilot led the Vickers machine over a rocket battery, but, with great skill, Lt. Insall dived and got to close range, when Donald fired a drum of cartridges into the German machine, stopping its engine. The German pilot then dived through a cloud, followed by Lt. Insall. Fire was again opened, and the German machine was brought down heavily in a ploughed field. On seeing the Germans scramble out of their machine and prepare to fire Lt. Insall dived to 500 ft., thus enabling Donald to open heavy fire on them. The Germans then fled, one helping the other, who was apparently wounded. Other Germans then commenced heavy fire, but in spite of this, Lt. Insall turned again, and an incendiary bomb was dropped on the German machine, which was last seen wreathed in smoke. Lt. Insall then headed west in order to get back over the German trenches, but as he was at only 2,000 ft. altitude he dived across them for greater speed, Donald firing into the trenches as he passed over. The German fire, however, damaged the petrol tank, and, with great coolness, Lt. Insall landed under cover of a wood 500 yards inside our lines. The Germans fired some 150 shells at our machine on the ground, but without causing material damage. Much damage had, however, been caused by rifle fire, but during the night it was repaired behind screened lights, and at dawn Lt. Insall flew his machine home with First Class Air Mechanic T. H. Donald as a passenger.

* * *

BUCKINGHAM PALACE, Sept. 27th.

The King held an Investiture of the Most Excellent Order of the British Empire at 10.30 o'clock this morning.

The following were severally introduced into the presence of the Sovereign, when the King invested them with the Insignia of the respective Divisions of the Order into which they have been admitted :—

KNIGHTS GRAND CROSS.

THE LORD SYDENHAM.

COMMANDERS.

Mr. Leonard Bairstow. Lieut.-Colonel Henry Fowler.

* * *

Lieut.-General Sir David Henderson (Director-General of Military Aeronautics), and Lieut. G. F. Knight (Devonshire Regiment, attached Royal Flying Corps), had the honour of being received by the King.

NAVAL.

ADMIRALTY COMMUNIQUÉS.

SEPT. 25th.—During the morning of the 24th instant a bombing raid was made by naval aircraft on Varssenaere (three miles south-west of Bruges) aerodrome. A large number of bombs were dropped, mostly falling among the sheds and hangars, and also among the aeroplanes lined up on the aerodrome.

On the same day a fighter patrol met a large formation of Albatros scouts, and one enemy machine was destroyed and another driven down completely out of control.

All our machines returned safely.

SEPT. 26th.—A bombing raid was carried out by the Royal Naval Air Service at noon on September 25th on Sparappelhoek

Several direct hits were reported, and smoke was observed from sheds on the south-west side of the aerodrome. Many bombs were dropped.

During the day our fighter patrols over the Fleet encountered six hostile seaplanes, two of which were driven down.

A bombardment of the naval establishments at Ostend was carried out by our naval forces during the afternoon, and several hits were observed on the Atelier de la Marine.

SEPT. 27th.—A bombing raid was carried out by naval aircraft to-day on St. Denis Westrem aerodrome.

Bombs were dropped on sheds and on fifteen Gothas lined up on the aerodrome, a direct hit being observed on the latter.

All our machines returned safely.

During the night of 25th-26th the Royal Naval Air Service carried out bombing raids on the following objectives: Thourout Junction. Lichtervelde Junction. Cortemarck Junction.

Many tons of bombs were dropped, and several direct hits were made on the lines.

All our machines returned safely.

SEPT. 30th.—During the night, September 27th-28th, bombing raids by naval aircraft were made on the following objectives :—

The lock gates at Zeebrugge.

St. Denis Westrem Aerodrome (south-west of Ghent).

Gontrode Airship Shed (south-east of Ghent).

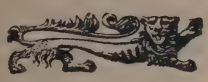
Houttave Aerodrome (about 13 miles east of Ostend).

The bomb dropping at Zeebrugge appeared good, while at Houttave the bombs fell among hangars and huts on the south-west side of the aerodrome. In all seven tons of explosives were dropped.

All machines returned safely.

During the afternoon of September 29th a bombing raid was carried out by naval aircraft on St. Denis Westrem aerodrome. Many bombs were dropped and direct hits were observed among sheds and Bessonneaux tents. A bomb exploded amongst five machines lined up on the aerodrome.

All machines returned safely.



A bombing raid was carried out on September 27th by naval aircraft on storehouses, etc., on the south-western side of Beirut harbour (on the Syrian coast).

Many direct hits were obtained, and fires were started.

It was observed that damage caused to sheds as a result of the raid on August 18th was in course of repair.

All our machines returned safely.

The storehouses on the mole were afterwards shelled by a cruiser and set on fire.

KINDLY MENTION "THE AEROPLANE" WHEN CORRESPONDING WITH ADVERTISERS.

Oct. 1st.—During the night of September 29th bombing raids were carried out by naval aircraft over the following objectives:

The lock gates at Zeebrugge.

St. Denis Westrem Aerodrome.

Thourout Aerodrome.

Brugeoise works and trains.

Several tons of bombs were dropped with good results, a large fire being caused at St. Denis Westrem Aerodrome.

During patrol several aerial combats occurred, with the result that two enemy machines were destroyed, and one was driven down completely out of control.

A Gotha was also driven down, and it is thought to have been damaged.

All our machines returned safely.

The Casualty List.

Reported Sept. 27th.

Wounded.—Harrower, Flt. Sub-Lt. G. S., R.N.

Johnston, Flt. Sub-Lt. W. C., R.N.

Accidentally Injured.—Stauffer, Prob. Flt. Officer J. S., R.N.

Reported Sept. 28th.

Died of Injuries.—Lockie, Prob. Flt. Officer K., R.N.

Missing.—Phillips, Flt. Sub-Lt. A. W., R.N.

Foster, Flt. Sub-Lt. E., R.N.

Wounded.—Fisher, Actg. Flt. Comdr. P. S., D.S.C., R.N.

Jordan, Flt. Sub-Lt. W. L., R.N.

Previously reported Missing, believed Killed, now reported Killed.—Woodhouse, Flt. Sub-Lt. M. G., R.N.

Reported Sept. 29th.

Wounded.—MacDonald, Flt. Sub-Lt. A. F., R.N.

Reported Oct. 1st.

Missing.—Kilner, Flt. Comdr. B. D., R.N.

Akester, Flt. Sub-Lt. J. C., R.N.

Burnett, Flt. Sub-Lt. W. J., R.N.

Ingleson, Flt. Sub-Lt. W., R.N.

de Wilde, Flt. Sub-Lt. J. S., R.N.

Wounded.—Daly, Flt. Sub-Lt. R. H., D.S.O., R.N.

Calvert, Flt. Sub-Lt. C. W. L., R.N.

Slightly Injured.—Meredith, Proby. Flt. Officer E., R.N.

Previously reported Missing, now reported Prisoner.—Hall, Flt. Sub-Lt. N. D., R.N.

Lewis, Flt. Sub-Lt. A. D. M., R.N.

Reported October 2nd, 1917.

Died of Injuries.—Flight Com. John D. Newberry, R.N.

Seriously Injured.—Prob. Flight Officer Bernard J. E. Anson, R.N.

Previously reported Missing, now reported a Prisoner of War.—Flight Sub-Lieut. Harold H. Booth, R.N.

Previously reported Missing, now presumed Killed.—Flight Sub-Lieut. John J. de la T. Fox, R.N.; Mr. John Barber, Midshipman, R.N.R.

PERSONAL NOTICES.

Death.

LOCKIE.—Prob. Flt. Officer Keith Lockie, R.N., who was fatally injured in a flying accident abroad, was the younger son of the late Andrew Lockie, of Caterham, and Duns, N.B., and of Mrs. Herbert Mason of Warlingham. He was 19 years of age.

Engagement.

HYDE-THOMSON—SHARP.—The engagement is announced of Squadron-Commander Douglas Hyde Hyde-Thomson, R.N., second son of Mr. and Mrs. Robert Donald Thomson, of Pool House, Groby, Leicestershire, and Eileen Ethel, younger daughter of Mr. and Mrs. Basil Carter Sharp, of 4, Hyde Park Terrace, London, W.

Marriage.

ENGLAND—BAKER.—On Sept. 24th (very quietly, owing to mourning), at the Church of St. Mary-in-the-Boltons, South Kensington, Observer Sub-Lieut. Maurice Ord Fuller England, R.N., only son of Dr. and Mrs. G. Fuller England, Buckingham House, Winchester, was married to Evelyn Iris, elder daughter of George Baker and the late Mrs. Baker, of St. Margaret's Bay, Dover, by the Rev. P. Basil Phelps, M.A., F.R.Hist.Soc.

MILITARY.

G.H.Q. Communiqués.

Sept. 25th, 9.32 p.m.—On the 24th inst., in spite of thick mist which hung over the lines all day, our aeroplanes showed great activity. Observation for our artillery was continued, and many photographs were taken of the enemy's forward and back areas.

Four tons of bombs were dropped during the day on German aerodromes north and south of Roulers and near Cambrai, on an important railway centre east of Tournai, and upon billets and hutments round Lens and Roulers. At night an ammunition dump north of Cambria and rest billets east of Lens were also bombed.

Three enemy machines were brought down in air fighting and five were driven down out of control.

The pilot of one of the machines brought down on the 23rd inst., proved to be Lieut. Voss, who, it is claimed in the enemy communiqués, had brought down many Allied machines.

Four of our aeroplanes are missing.

Sept. 26th, 10.3 p.m.—On the 25th instant our aeroplanes were extremely active, working with our artillery and bombing and taking photographs of the enemy's forward areas and his aerodromes.

Most successful bombing raids were carried out during the day on an aerodrome and railway siding near Ghent, where a large fire was started on aerodromes, near Courtrai and Cambrai, on billets east of Lens, and on hutments south-west of Roulers.

In all five tons of bombs were dropped in these raids. A further five tons were dropped, and many thousand rounds were fired from machine-guns during the night on Menin and Wervicq and on enemy troops and transport on the roads leading from these towns to the battle front.

A great deal of fighting took place yesterday, and a record number of hostile machines were accounted for. In air fighting 17 German aeroplanes were brought down, and six were driven down out of control. In addition to these a German three-seater bombing machine was shot down last night by our anti-aircraft guns.

One of our machines is missing.

Sept. 27th, 9.24 p.m.—On the 26th inst. the weather was misty during the morning, and later in the day was overcast, with a strong west wind. In spite of this our aeroplanes were extremely active in co-operation with the artillery and infantry in the battle area. The enemy's troops in the fighting line and his reserves in rear were harassed with machine-gun fire throughout the day.

Some 30,000 rounds were fired from altitudes of 100 ft. and upwards, and many parties of German infantry were dispersed with casualties. On one occasion three of the enemy's guns were fired on while in movement. The teams of two guns bolted, and the third overturned.

Strong opposition was encountered from the enemy's fighting machines, and a very large number of combats took place at low altitudes. Heavy casualties on both sides resulted owing to the difficulty of regaining control of damaged machines when flying near the ground.

The weather prevented any extensive bombing operations during the day, but at night over two tons of bombs were dropped on the enemy's reserves in rear of the battle front.

Seven hostile machines were brought down in air fighting and three were driven down out of control. Five other hostile machines were brought down by the fire of our infantry.

Thirteen of our machines are missing.

Sept. 28th, 10 p.m.—On the 27th inst. heavy ground mist again hindered aerial work. Our aeroplanes continued to co-operate with the artillery, and many hostile areas were reconnoitred and photographed.

During the day bombs were dropped by our aviators on the enemy's aerodromes at Carnières, St. Denis Westrem, and Gontrode, on billets at Moorslede, and on other targets. At night a total of 6¾ tons of bombs were dropped on Gontrode aerodrome, where good results were obtained, on the enemy's railway stations at Rumbeke, Menin, Wevelghem, Ledeghem, and on various hostile billets and a dump.

In the course of these raids German troops and transport were successfully attacked by machine-gun fire from low altitudes.

In air fighting six German machines were brought down, while three others were driven down out of control. In addition, one hostile machine was shot down by our infantry.

One of our aeroplanes is missing.

Sept. 29th, 8.59 p.m.—On the 28th inst. artillery and photographic work was continued by our aeroplanes, and over four tons of bombs were dropped on the enemy's aerodromes at Gontrode (south-east of Ghent) and Carnières (east of Cambrai), and on hostile dumps, billets, and railways.

At night another six tons were dropped on similar targets, including the aerodrome at Gontrode, where the enemy's anti-aircraft guns, machine-guns, and searchlights were most active. In spite of the heavy barrage which was put up over the aerodrome all our machines returned safely.

During these raids our aeroplanes again used machine-gun fire with good effect against all enemy troops and transport seen.

As the result of air fighting nine German machines were brought down and four others were driven down out of control. In addition one enemy machine was shot down by our anti-aircraft guns. Three of our aeroplanes failed to return.

Sept. 30th, 9.33 p.m.—On the 29th inst. the weather was unfavourable for aerial work. A number of valuable photographs were taken, however, and some observation was carried out for the artillery.

Bombing of the enemy's aerodromes, billets, dumps, and railways was continued vigorously by our aeroplanes by day and night, and over seven tons of bombs were dropped. Gon-

(Private Branch Exchange)

trode aerodrome was the chief target for our machines, and a large fire was caused there.

One of the enemy's balloon sheds also was set on fire and destroyed by a naval pilot.

The enemy's fighting machines were not very active yesterday, and there were comparatively few combats. One German machine was brought down, and two of our aeroplanes are missing, one of which was seen to land under control.

Oct. 1st, 9.29 p.m.—Visibility improved on September 30th, and a great deal of artillery and photographic work was accomplished by our aeroplanes.

Bombing was continued without respite by day and night, and over eleven tons of bombs were dropped on the enemy's aerodrome at Gontrode, on hostile billets and communications in the battle area, and on a dump and headquarters near Cambrai.

The enemy also carried out many bombing raids during the night, but did little damage of military importance.

A photograph taken of the results of our bombing at Gontrode aerodrome shows that on the night of September 29-30th one of the sheds at the aerodrome was hit.

The same photograph shows that three large German machines have landed in a field five miles south of Gontrode aerodrome. Two of the machines are clearly damaged, and reconnaissances carried out to-day found all three machines still lying in the field.

The large airship shed which is now used for the accommodation of Gotha aeroplanes at this aerodrome is reported to have been set on fire last night.

Enemy aircraft were not very active yesterday, but a few large formations were encountered. Four German machines were brought down and eight were driven down out of control.

Five of our aeroplanes are missing.

War Office Communiques.

Sept. 28th.—The G.O.C the British Forces in Macedonia reports :—

Our aeroplanes have carried out several successful bombing raids, causing damage to the enemy's trenches, camps, and battery positions.

Sept. 29th.—The G.O.C. British Forces in Mesopotamia reports: On Sept. 25th two of our aeroplanes engaged in reconnaissance on the Tigris north of Samarra failed to return.

Home Command Communiqués.

Sept. 25th, 11.45 a.m.—Latest reports concerning last night's aeroplane raid show that the group of raiders which approached London was driven off by anti-aircraft gunfire, only one, or at most two, machines penetrating the defences. The casualties in all the raided districts reported by the police up to the present are :—

Killed, 15; injured, 70.

Material damage is not great.

Enemy airships crossed the Yorkshire and Lincolnshire coasts between midnight and 3 a.m., but there is no evidence of their having penetrated to any distance inland. They were driven off by gunfire from various defended localities which they attempted to approach.

Bombs were dropped at one coast town, three women being slightly injured.

Little material damage was caused.

Sept. 25th, 9.40 p.m.—The Thames Estuary was again the objective of a hostile air raid this evening. The Kent and Essex coast was crossed at various points and a few bombs were dropped. No casualties have yet been reported.

One raider penetrated as far as the South-Eastern outskirts of London, where two bombs fell, causing some 20 casualties.

Sept. 26th, 11.30 a.m.—Latest reports show that the first group of raiders which approached London last night were turned back by gunfire, not more than two machines actually penetrating the defences. These machines dropped a number of bombs in the south-eastern outskirts of London at about 7.45 p.m., which damaged some dwelling houses, killing six and injuring 16 persons.

A second group of raiders which approached London half an hour later were driven off.

Bombs were dropped in various localities in south-east England; up to the present no casualties or damage have been reported.

Later Report.—The latest police reports show that in last night's air raid seven persons were killed and 25 injured in all districts.

Sept. 28th, 10.40 p.m.—Hostile aeroplanes attacked the South-East Coast this evening.

Raiders were reported from various points along the coast of Suffolk, Essex, and Kent.

The majority of the raiders did not venture far inland; a few of them headed towards London, but failed to reach the Metropolis.

Bombs have been dropped in Suffolk, Essex, and Kent.

No reports as to casualties or damage have yet been received.

Sept. 29th, 11.30 a.m.—Latest reports indicate that about 20 enemy machines participated in last night's raid. Repeated attacks were made upon London, but in no case did the raiders penetrate the outer defences.

Bombs were dropped in a number of places in Kent, Essex, and Suffolk, but no casualties and only insignificant damage have been reported up to the present.

One enemy aeroplane is reported to have been shot down in the Thames Estuary and a second off the coast.

Sept. 29th, 10.30 p.m.—Hostile aeroplanes crossed the coasts of Kent and Essex in groups between 8 and 9 p.m.

Several attacks were made upon London and some bombs were dropped in the north-eastern and south-eastern districts.

Bombs were also dropped at various places in Kent and Essex.

No reports of casualties or damage have yet been received.

Sept. 30th, 12 noon.—Latest reports show that a determined and simultaneous attack was made upon London by three groups of raiders. Each of these groups, which approached from different directions, were broken up by anti-aircraft gunfire, and only two or at most three machines penetrated the refences. Bombs were dropped in the north-eastern and south-eastern districts.

A fourth group of enemy machines which attempted to approach London later was driven off, none of the raiders penetrating the outer defences of the capital.

Bombs were also dropped at various places in Kent and Essex.

Full reports of casualties and damage have not yet been received, but both are believed to be comparatively light.

Sept. 30th, 4 p.m.—Police reports state that the casualties in last night's air raid in all districts visited by enemy aeroplanes were :—

Killed	11
Injured	82

Material damage was not great.

Sept. 30th, 9.30 p.m.—Two groups of enemy machines, followed by others flying singly, crossed the Kent and Essex coast between 6.40 and 8 p.m.; they came towards London.

About 10 penetrated the outer defences, but only four or five got through to London itself.

Bombs are reported to have been dropped in Kent and Essex and also in London.

No details as to casualties or damage have yet been received.

Oct. 1st, 1 p.m.—Latest reports state that the casualties in last night's air raid in all districts were :

Killed	9
Injured	42

Only two persons were killed in London.

Material damage was not great.

One enemy machine is reported to have been brought down off Dover.

10.25 p.m.—A group of hostile aeroplanes crossed the Essex Coast about 7 p.m and proceeded across Essex towards London. This group of machines was followed at about a quarter of an hour's interval by a second, which pursued the same course.

The first attack on London was delivered from the North-East at about 7.45 p.m. Most of the raiders were turned back, but one or more machines penetrated the defences, and dropped bombs in the South Western district at about 8.15 p.m.

The second group of raiders attempted to cross the defences at various points in the North-East and North of London, but without success until shortly after 9 p.m., when a few of the machines passed across London. Bombs were again dropped in the South-Western district.

Meanwhile a third group of raiders crossed the Kentish coast and dropped bombs at various places. This group did not penetrate far westwards.

A fourth group of enemy machines crossed the Essex Coast about 8.50 p.m., and proceeded towards London, which was approached shortly before 10 p.m. They did not penetrate farther than the North-Eastern outskirts of London, where some bombs are reported to have been dropped.

No reports of casualties or damage have yet been received.

Sept. 20th.—R.F.C.—Shepherd 1054 Flt.-Sjt. A. G. (Wolverhampton).

PERSONAL NOTICES.

DEATHS.

BARLOW.—Sec. Lt. John Lancashire Barlow, R.F.C., who was killed on Sept. 23rd, aged 18, was the second son of Mr. and Mrs. Alexander Barlow, of Wivenhoe Hall, Essex. He was educated at Mr. Brown's School, Eastbourne, and at Shrewsbury School, and joined the 8th Essex Cyclist Battalion on August 4th, 1914, at the age of 15. He served until December, and then trained for the Royal Fying Corps. On reaching the ag eof 18 he was gazetted to a commission in the R.F.C. He had served four months at the front as a scout flyer.

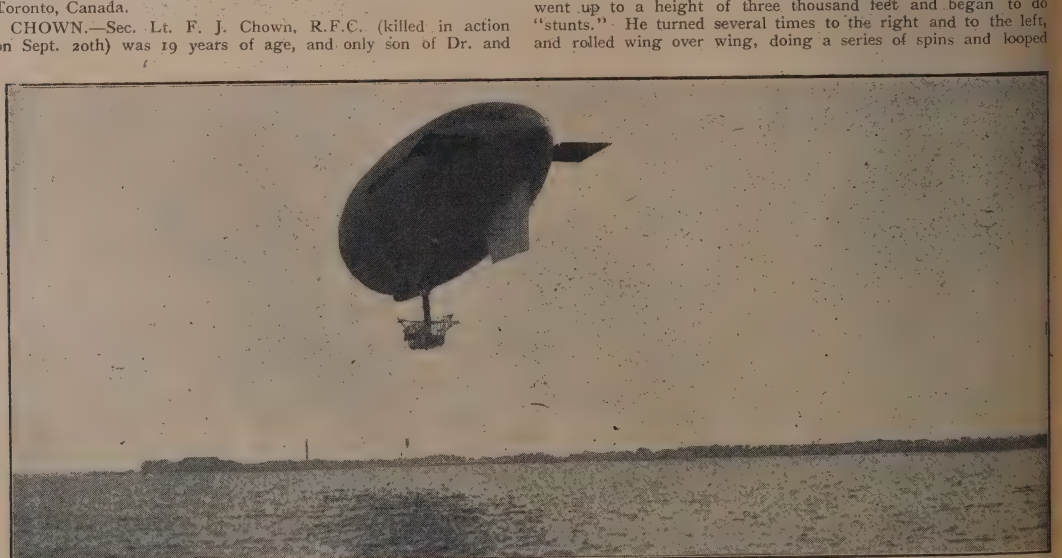
BOYD.—Sec. Lieut. Philip Bentinck Boyd, Gordon Highlanders, attd. R.F.C., who was previously reported missing, now reported killed in action on April 13th, was the husband of Dorothea Boyd and elder son of Mr. and Mrs. Gamble Boyd, Toronto, Canada.

CHOWN.—Sec. Lt. F. J. Chown, R.F.C. (killed in action on Sept. 20th) was 19 years of age, and only son of Dr. and Mrs. Chown, of Townshend, near Hayle, Cornwall. He had his commission in July, 1916, and received his "wings" in May of this year.

CRUICKSHANK.—Sec. Lieut. Kenneth George Cruickshank, R.F.C., reported missing on July 11th last, is now officially reported killed in action on that date, while engaged on an offensive patrol.

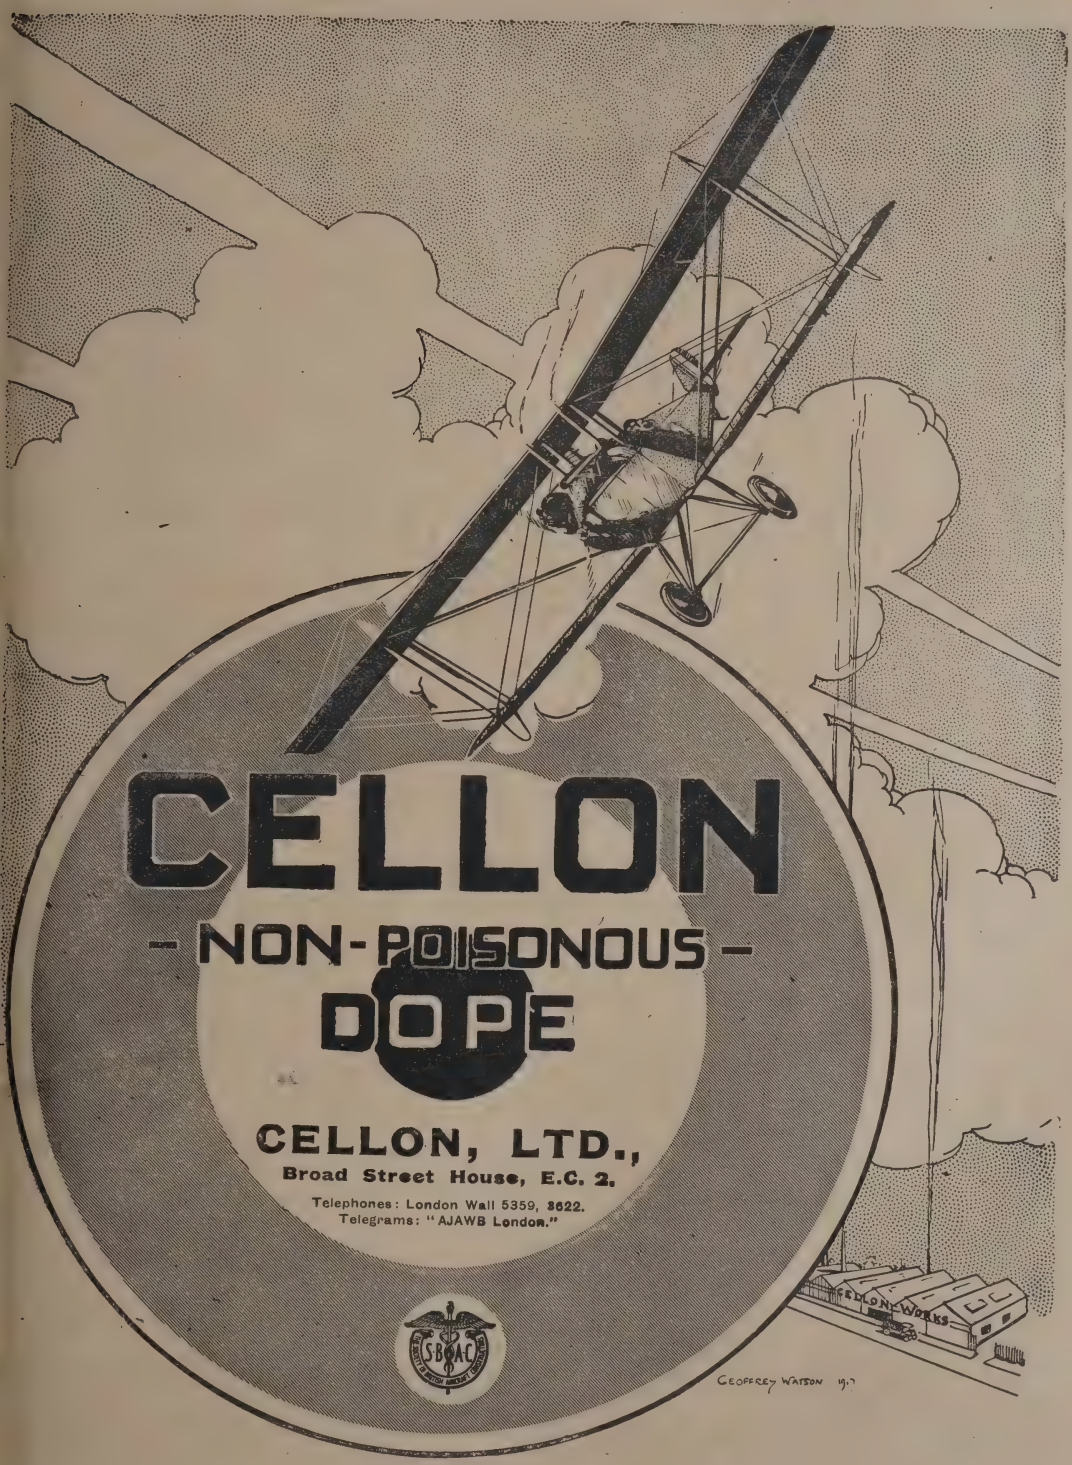
He was the only son of Mr. James Cruickshank, of 47, Northwood Road, Forest Hill, and the War Office. He was educated at St. Dunstan's College, Catford, and Finsbury Technical College, and joined the 20th London Regt. on the outbreak of the war. Obtaining a commission on December, 1914, in the Lancashire Fusiliers, he was transferred to the R.F.C. in June, 1916, while serving in Egypt.

He obtained his wings at home in March, 1917, and proceeded abroad on June 6th to join a scout squadron. He was 21 years of age.



LITCHFIELD.—An inquest was held at South Darenth on Sept. 27th on the body of Lt. Frederick George Litchfield, R.F.C., whose home was at Baring Road, Croydon, and who was killed by the falling of his machine on Sept. 24th. It was stated by a soldier that the machine was flying very low, only about 50 ft. up, and the engine was making a peculiar noise. The machine dropped to about 30 ft., and then suddenly nose-dived into a field. Major Maxwell said the machine was so badly smashed that it was impossible to say what caused the accident. A verdict of death from misadventure was returned.

A statement was published in this column last week that Lieut. H. Nunn, R.F.C., had been killed at Dartford through the aeroplane in which he was flying nose-diving to earth, and that his companion had been injured. The facts are that Mr. Nunn, who was acting as observer, was injured, but not killed, while Lieut. Litchfield, the pilot, lost his life.



McKERGOW.—Lieut. Robert Dudley Wilson McKergow, Dragoon Guards, attd. R.F.C., elder son of Lieut.-Colonel McKergow (Queen's Own) Royal West Kent Regiment, and Mrs. McKergow, of Twineham Grange, Sussex, was killed in action while flying on September 21st. Born in 1898, and educated at Rottingdean School and Uppingham, he entered Sandhurst in May, 1915, and was gazetted to the Dragoon Guards on October 20th, 1915. He joined the R.F.C. as an observer on September 13th, 1916, and served four months in France, returning to England to obtain his pilot's certificate. He returned to the front on August 11th last.

His commanding officer writes:—"Your son was one of the most popular members of this squadron, and had done very gallant work during the short time that he was with us."

MAITLAND.—An inquest was held on Sept. 25th, at Croydon, on Sec. Lieut. Arthur James Maitland, R.F.C., aged eighteen, who was killed on Sept. 22nd, as reported last week. The father said his son was a keen aviator and had been training since May, but had not won his wings. He was never happier than when he was flying. A Captain said that Mr. Maitland was flying a certain machine, which they found to be all right. He went up to a height of three thousand feet and began to do "stunts." He turned several times to the right and to the left, and rolled wing over wing, doing a series of spins and looped

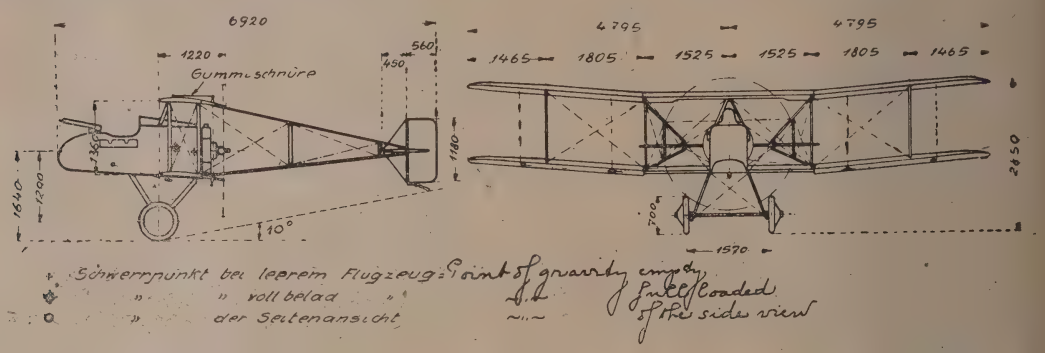
the loop. Suddenly he came down in a spinning nose dive known as the corkscrew, and witness thought he was "stunting," but unfortunately he misjudged the distance. He fell to earth, and the machine was smashed, with the aviator underneath. A verdict of accidental death was returned.

NOSS.—Sec. Lieut. Arthur Rex Burden Noss, M.C., R.F.C., only child of Mr. and Mrs. A. A. Noss, of 2, Dickenson Road, Crouch Hill, N., has died of wounds. He was educated at Herne Bay, and in his last year there won eight prizes in the athletic sports.

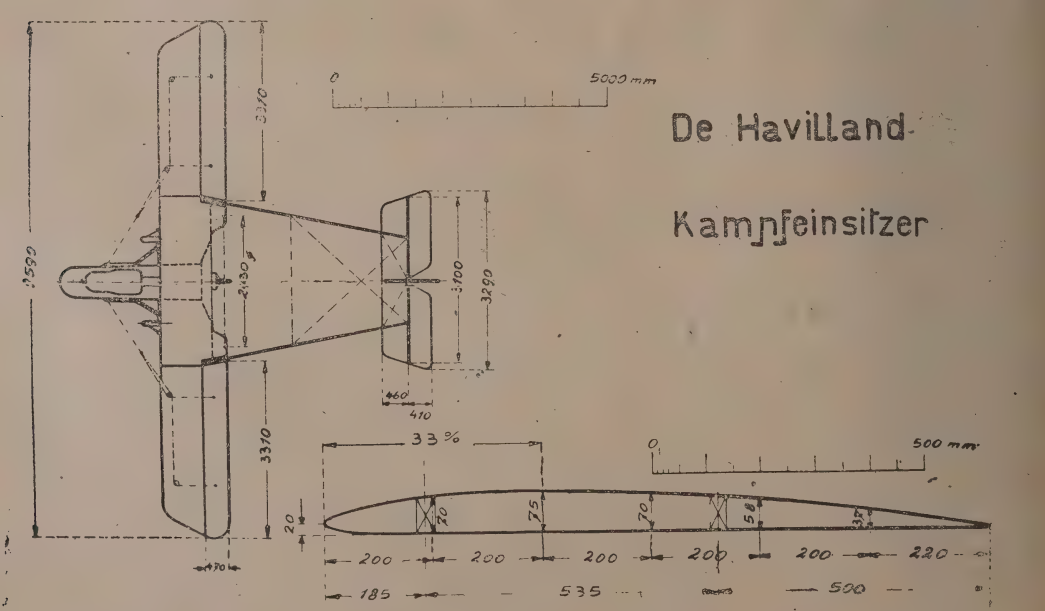
PEGGS and JAMES.—Inquests on the bodies of two air mechanics who lost their lives as the result of an observation balloon breaking away from Roehampton were held on Sept. 25th. Five captive balloons broke away on Sept. 21st. Two mechanics named Peggs and James were caught by the ropes and dragged into the air. James let go and fell after the balloon had travelled a short distance, and Peggs fell at South Norwood.

The flight sergeant said there were five balloons connected together by a cable, and nobody was to go up in them. They were being sent up as an experiment, the cable was fixed to the balloons, and the order was given to haul them down. There were 48 men holding them. "There was a gale," said the witness, "and my balloon was nearest to the wind. Suddenly there was a bang and the cable was broken. I shouted 'Stand clear; leave go, everybody.'" The balloon shot up into the air, dragging Peggs and James with it. They were caught in the rigging and had no chance. Eventually the other balloons broke away. James let go and fell, being killed instantly. The last he saw of Peggs was that he was hanging onto the balloon. The witness had never seen a cable break before.

A second lieutenant of the R.F.C. said the extra strain on the cable was the cause of it snapping. Both men were caught in the rigging. If they had been able to make themselves fast, they would have been saved, because the balloon would automatically deflate. The balloon had drifted eight miles before Peggs fell out.



A gardener at Falkland Park said that as the balloon approached him he saw Peggs falling, turning over as he fell. He crashed through the trees, and fell into the shrubbery about 3 ft. away from the witness.



In each case a verdict of "Accidental death" was returned.

TALBOT and MALCOLM.—An inquest was held on Sept. 27th at Southend on the bodies of Sec. Lieut. Arthur Sydney Talbot, R.F.C., aged 28, and Sec. Lieut. Geoffrey Malcolm, R.F.C., aged 26, who were killed as the result of a collision in the air. An officer of the R.F.C., who witnessed the accident, said the officers were flying at a height of some 500 to 800 feet, and as they were descending in spiral fashion a machine in charge of Lieut. Dick came into collision with them. It was thought that in the positions in which the machines were the pilots could not see one another. The machines fell to the ground and were wrecked. The two officers were killed, and Mr. Dick suffered a broken leg. A verdict of "Accidental death" was returned. Mr. Malcolm was taking his first lesson in flying.

WARD.—Major George Bernard Ward, M.C. (Squadron Commander), R.F.C., who was killed on Sept. 21st, was the eldest son of David Ward, Lower Hall, Foxearth, Essex. He was 26 years of age. Memorial service at 3.30 p.m. on Sept. 30th at Foxearth Church.

AERONAUTICAL ENGINEERING

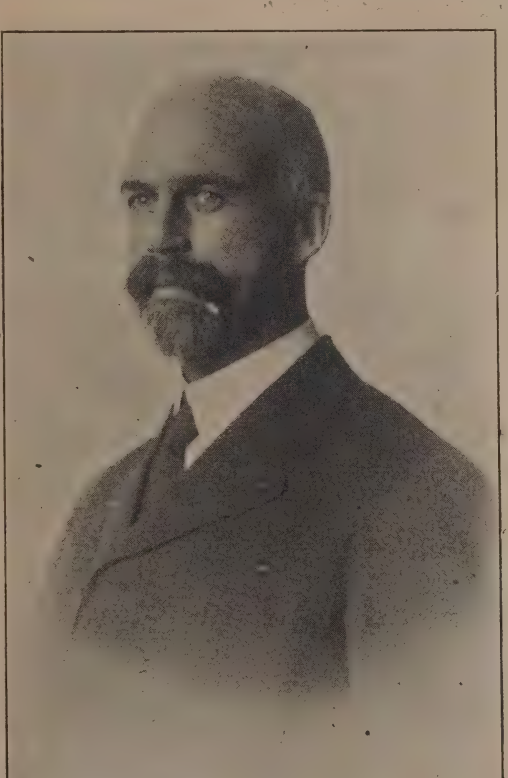
SUPPLEMENT TO "THE AEROPLANE"

INCORPORATING AIRCRAFT ENGINEERING, AERODYNAMICS, AND MATTERS PERTAINING TO THE AERONAUTICAL ENGINEER AND THE AIRCRAFT TRADER

A Canadian Pioneer of Scientific Aerodynamical Research.

By W. Bernard Murphy, M.Ae.S.

Mr. W. R. Turnbull, M.E., A.F.Ae.S., F.R.Met.Soc., was born on October 16th, 1870, at St. John, N.B., Canada. He received his University training at Cornell University, New York State, U.S.A., where he graduated in 1893 with the degree of mechanical engineer. He then proceeded to Europe and continued his scientific studies at Berlin and Heidelberg in Germany until 1895.



Then he obtained the position of experimental engineer with the General Electric Company, of Harrison, New Jersey, where he remained until 1900. Determining to undertake scientific research work he returned to his home in Canada, and, in 1902, became interested in aviation.

The following year he established a laboratory at Rothesay, New Brunswick, containing a small wind-tunnel, 2 ft. 6 ins. square. With the aid of this he investigated the problems of lift, drag, centre of pressure, etc., of various types of aerofoils.

His first results were published in the "Physical Review," New York, for March, 1907. At this time the only published data on the travel of the centre of pressure was by Joessl. Mr. Turnbull investigated these data and discovered that Joessl's Laws only applied to flat surfaces. He also discovered the principles of the double curvature surface, by which the centre of pressure advances steadily towards the leading edge of an aerofoil as the angle of incidence is decreased.

This question of the double curvative surfaces, involving as it does important considerations concerning the stability of aerofoils, has only recently been investigated by M. Eiffel, the National Physical Laboratory, and others. The results then obtained are incorporated in some of the fastest modern aircraft, and will be even more extensively applied to the heavier aircraft of the near future.

In 1906 Mr. Turnbull tried to produce a seaplane by first developing a hydroplane, driven from petrol motor by means of an air propeller, and afterwards attaching wings of his own design. He conducted numerous experimental trials with two different forms of hydroplanes during 1906-7. At that time, however, the only engines he could obtain were of such low power and so unsatisfactory in use that he had to abandon his experiments.

Mr. W. R. Turnbull, M.E., A.F.Ae.S., F.R.Met.Soc.

Most of 1908 he spent in laboratory research work, but towards the end of the year came to Europe in search of a reliable aero-motor. His search proved fruitless, but while in England he read a paper, entitled "The Efficiency of Aeroplanes, Propellers and Motors," before the Aeronautical Society of Great Britain, for which he was awarded the bronze medal of the Society. This was the first medal ever awarded by the Society.

On his return to Rothesay he commenced an exhaustive investigation into the design of air propellers. In 1910 he discovered the static laws of air propellers, which were published in the "Aeronautical Journal" for October, 1910. These laws have since been confirmed by Riabouchinsky, Eiffel, and many other scientists.

After this he built a special track several hundred feet long so as to be able to investigate more thoroughly the efficiency of airscrews travelling through air. The results obtained from these experiments he published in the "Aeronautical Journal" in January, 1911. Mr. Taylor also acknowledged Mr. Turnbull's pioneer work in this direction in his article for the same journal of a later date.

The following year he was elected an Associate Fellow of the Aeronautical Society of Great Britain and chosen to represent the Society at the first annual meeting of the American Aeronautical Society.

Later on he conducted a long series of experiments to discover the relative efficiency of the many devices proposed for aeronautical locomotion. These consisted of propellers, feathering paddle wheels, flapping wings, vacuum discs, and many others. It was while engaged in these experiments that he obtained the data for his "General Laws of Aerodynamics," published in the "Aeronautical Journal" for January, 1912. It was also at this time that he discovered that "Langley's Law" was only a certain phase of one of the above general laws.

On the outbreak of war he left Canada for England to give his services towards producing fighting aeroplanes. He became associated with one of the firms just starting to manufacture aircraft. Of his war-work it is impossible to give full details, but some outstanding features of it are already well known. His propeller work in par-

ticular has been highly successful. The present altitude record for seaplanes was obtained by aid of one of his propellers, and the propellers of his design have proved on occasion much more efficient than those of other designers, private as well as official.

He has also designed other apparatus to assist the fighting services in such branches of their work as bomb-dropping and prevention of submarine attack.

It is to be hoped that when peace returns he will find time to publish all the valuable data that he has discovered by his years of patient research and experiment. It must also be recorded that, although Mr. Turnbull may be classed among the scientific pioneers of aerodynamics, he did not obtain all his data within the ease and comfort of his laboratory. The plant for his early experiments had all to be devised and built by himself, and much of his knowledge was only obtained by travelling extensively between the aviation centres of Europe and America.

Not content with this, whenever any data are required which necessitate actual flying, he is always ready to go up in new and experimental machines to see for himself the results of his calculations. In spite of his mature age he recently went to a height of over 13,000 feet to watch the performance of one of his propellers. The propeller in question, as a matter of fact, beat one of official design by 100 per cent. in the rate of climb.

Those, however, who have the pleasure of meeting Mr. Turnbull on the tennis court soon realise that age has dealt lightly with him. In fact, his opponents have been heard to declare that many of his strokes must have been originated in the laboratory with the aid of slide-rules and the other satanic devices of scientists.

The Production of Aeroplanes and their Components

(Fifteenth Instalment).

BY STEPNEY BLAKENEY.

Testing and Stretching Cables.

The necessary material for the cable testing and stretching apparatus consists of two sound pieces of deal or pitch-pine, 16 ft. long, 9 in. by 2 in. These will have to be planed all over, after which two pieces of 9 in. by 9 in. by 3 in. will be sandwiched between the two ends of these long pieces of timber so as to keep them 3 in. apart, on edge. When fastened to the legs they will stand on, they should be about 3 ft. 6 in. above floor level.

These 9 in. by 9 in. by 3 in. packing or distance pieces will be securely glued and bolted in their permanent position. After this, ¾-in. holes must be drilled through the centre of each piece of timber on each side-face, exactly opposite each other, about 9-in. centres, to allow of the tension-head of the apparatus being moved, and the length of the apparatus being adjusted to suit different lengths of cable.

The Tension-head.

Having completed the apparatus so far, the next thing to do will be to construct the tension-head. This can consist of a piece of sound, well-seasoned ash, about 1 ft. 6 in. long, by 9 in. by 3 in. This will have a ¾-in. hole drilled through the 3 in. thickness of the piece, in the centre, and 4½ in. from one end, so that the ¾-in. bolt, which passes through the side of the 16-ft. timbers, can pass through this piece also and hold it in position. On the sides of this short piece of ash two chocks, each 9 in. long by 3½ in. by 2 in., will be glued and bolted. And further, through the edge of this piece of ash, which is 3 in. thick, will be drilled a ¾-in. hole. This is for the ¾-in. tension-bolt to pass through, to which the cable which has to be stretched is attached.

At the other end of the 16-ft. timbers will be fixed a 10 to 1 bell crank-lever, or combination of levers. The short end will project upwards between the two 9 in. by 2 in. timbers, and to this will be fixed a suitable swivel link to which to attach the cables.

At the long end of the lever arrangements and fittings will be made for attaching a spring balance, capable of reading up to a load of at least 300 lbs. This will be used for the purpose of indicating the amount of strain to which the cable is being strained. (See Fig. 20.)

The many uses for testing purposes to which this machine can be put, and the valuable data obtained thereby, quickly repay its cost. The use of one of these machines is badly needed in most works using cables and ropes. It is easily made, and cannot get out of order. Also, accurate readings can be obtained by any intelligent person.

Castle Nuts.

Regarding the use of nuts, it frequently happens that "castellated" nuts have to be used, and, assuming that supplies have run out, which occasionally happens, it may cause considerable delay in waiting for further supplies from the actual manufacturers. Therefore, having described in the Tenth Instalment of this article the method generally adopted for making small bolts, it may be as well to add in this Instalment a method frequently adopted for cutting the slots of castellated nuts.

A small or large plain milling machine will be utilised for this purpose.

To the table of the machine attach a machine-vice, and in between the jaws lay a rectangular bar of mild steel which has been "shaped" all over. The length of the bar being not less than the length of the jaws, the size of this bar will depend on the size of the nuts to be castellated.

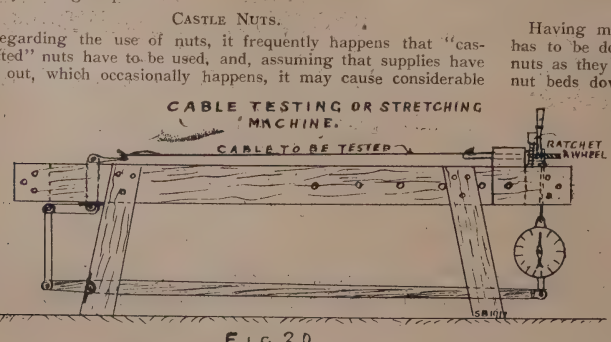


FIG 20

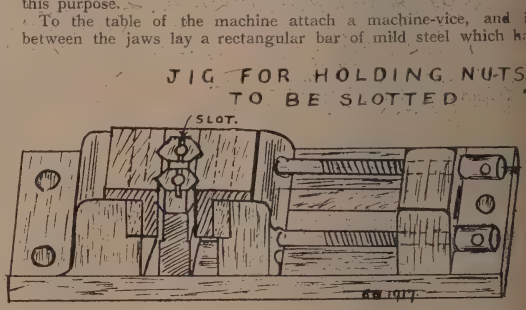

FIG 21

This bar of steel may be a few hundredths of an inch less in width than the width across the corners of the nuts (see Fig. 21). This is for the nuts to rest on, to keep them up to the slitting-saw.

For the purpose of holding, say, half a dozen nuts in between the machine-vice jaws, in their correct position for slotting, we must prepare two pieces of angle steel with vertical Vee slots cut in each of them. These Vee slots are for the purpose of gripping the corners of the nuts firmly, whilst they are being castellated.

Owing to these Vee slots being required in the angle steel pieces, it will necessitate them being made out of the solid bar, the angle for laying on the machine-vice jaws being either milled, planed, or shaped out. As these two pieces of angle steel will be subject to considerable work, it will be as well to make them at least ¼ in. thick all over, and case-harden them.

The Use of the Jig.

Having made the above jig for castellating the nuts, all that has to be done is to fill up the new angle jaws with as many nuts as they have Vee slots in them and carefully see that each nut beds down equally on the packing-up strips under them. Tighten up the jaws firmly, fix the slitting-saw in the mandril, and adjust the height of the milling machine table, and thereby regulate the depth of the slitting-saw cut in the nuts. Start the machine and the cross-feed and lubricate the saw with the cutting compound.

By this means half a dozen nuts can be quickly slotted across two flats, of each of them. As soon as this operation and cut is finished, stop the milling machine, unscrew the machine-vice slightly, turn each nut round, and slot twice more, and the six nuts are done. By this means nuts are slotted or castelled quickly, cheaply, and accurately.

KINDLY MENTION "THE AEROPLANE" WHEN CORRESPONDING WITH ADVERTISERS.

Hinge Bolts.

The milling of small hinge bolts is a subject which may be useful to consider, also the drilling of the pin-hole.

The small hinge bolts, having been turned out from the capstan lathes, and being made out of round bar, will at this stage of manufacture only have cylindrical heads, therefore, it is necessary to prepare a jig to hold them in whilst the heads are squared on the sides and the tops formed to a radius.

Making a Bolt Jig.

The jig may be formed in the following manner:—

The pattern-maker will be instructed to make a plain, rectangular pattern with the ends flanged for bolting down onto the table of the milling machine. The length will be about 10 in., the width 4 in., and the thickness about 3½ in. (see Fig. 22).

Plane up the top and bottom surface of the castings, which will be cast-iron. Then mark out the longitudinal centre line

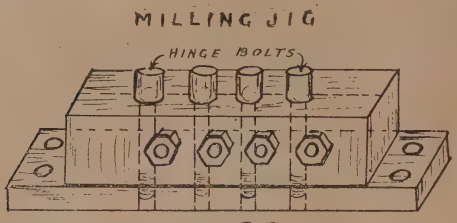

FIG. 22.

of the casting on the top side. On this line space out, at about 1-in. centres, the holes into which will be placed the hinge bolts to be milled. Drill these holes right through the casting to the bottom.

The next thing to do is to provide some means of fixing the bolts to be milled, therefore, a hole must be drilled through the centre of the side of the casting, at right-angles to the existing holes, at each one, in such a position that the circle of the fresh

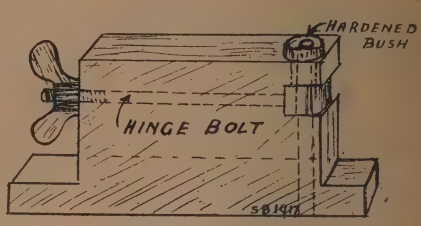

FIG 23

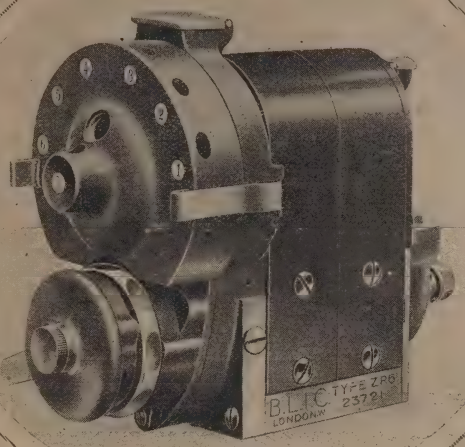
hole cuts the existing hole by about one-third of its diameter. Into these holes will be fitted plain bolts, with nearly one-third of their side filed off, so as to form a taper wedge against the bolt which is in the vertical hole to be milled. To prevent the wedge bolt from turning round and causing trouble when other bolts are required to be inserted for milling, a feather is fitted to the wedge bolt and a slot is filed in this bolt hole to take it.

Method of Use.



Having completed this jig, the method of working it will be to take, say, six bolts and drop them in the vertical holes, making sure that they are right home. Then firmly tighten up the nut at the end of each wedge bolt, thus locking all the bolts to be milled in position. Fix the jig on the table of the milling machine with bolts, and then fix the milling cutters. Adjust height of the table and proceed with the work.

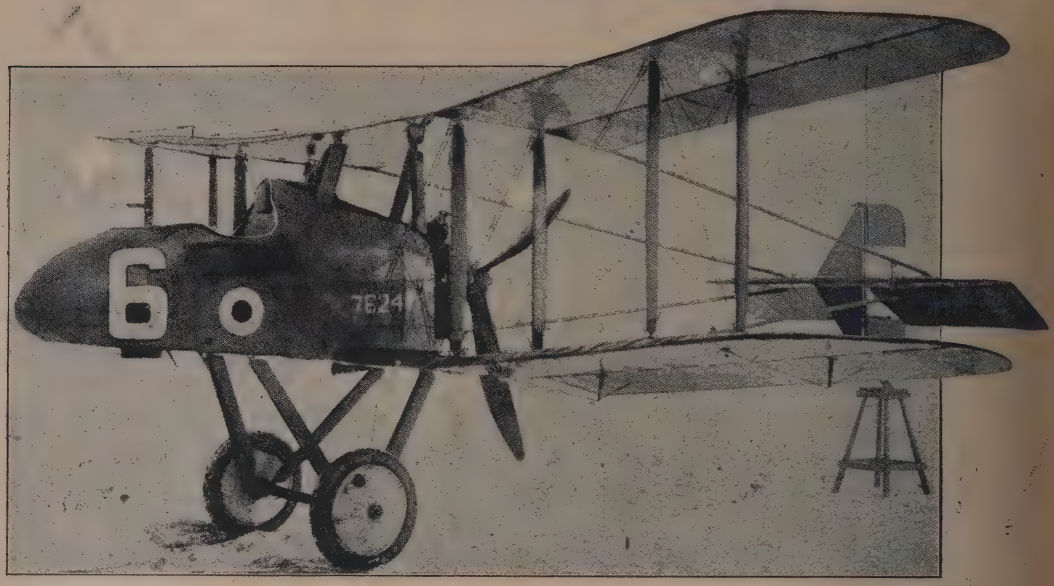
Having completed the milling of the heads of the hinge bolts, the next thing is the drilling of the pin-hole in them, and for this purpose a small drilling jig can easily be made (see Fig. 23).

(To be continued.)

IN THE HANDS OF THE ENEMY.—A Sopwith Triplane, evidently partly burnt, captured by the Germans. A detailed description, from the German point of view, is published on page 960.

British—and Best!

B·L·I·C



THE BRITISH LIGHTING & IGNITION Co. LTD.

Built in a British Factory by British workmen, with a unique experience of magneto manufacture, the "B.L.I.C." embodies every scientific principle in design and manufacture. It is the most reliable magneto yet produced—British or foreign.

At present our works are entirely engaged in meeting the requirements of the British and Allied Governments. We trust, however, you will specify the "B.L.I.C." Magneto for your post-war requirements.

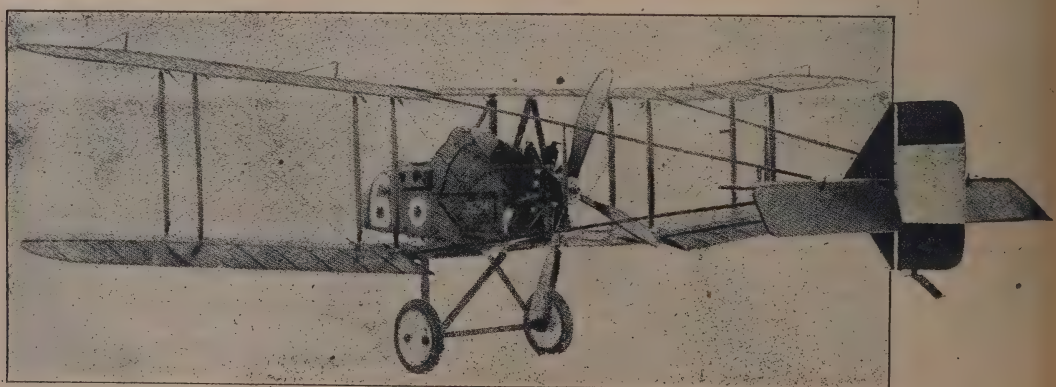
The BRITISH LIGHTING & IGNITION Co., Ltd.
(Proprietors: VICKERS, LIMITED),
204, TOTTENHAM COURT ROAD, LONDON, W.1.

IN THE ENEMY'S EYES.

A well-known British "Pusher" Scout, called by the Germans a de Havilland.

THE DE HAVILLAND FIGHTING SINGLE-SEATER (SO-CALLED).

The following particulars were published in "Flugsport," the leading German aeronautical paper, concerning one of our single-seat fighting pusher biplanes, which is apparently known to the Germans as a de Havilland. The mistake is, perhaps, excusable, and it could not matter very much if one told them wherein the mistake lies. Nevertheless, it might be a pity to destroy their cherished illusions. In any case, both machines are out of date in these days, having been put into use early in 1916. It seems well, however, to publish the illustrations and the description, which is given as translated literally by a neutral correspondent:—



"For the British designers it was difficult with the available means for even experts to produce a machine equal to the German ones, and the case was of producing a single-seated fighting aircraft. The main demands were: Maximum speed, control, climb and forward firing abilities. As the English aeroplane science was much behind, especially in the field of firing through the propeller, the producing of a tractor single-seater had thus to be excluded. Forced by need, the design resulted thus in a pusher type with tail-booms, being the small de Havilland scout, which was ordered in large quantities by the British armies.

"It is well known that this type was hurried to the British front early in 1916, where some whole squadrons were destroyed by accident. [Evidently a reference to the report of the announcement in Parliament of a squadron manned by new pilots being destroyed in a storm.—Ed.]

"As evident from the accompanying illustrations the de Havilland scout consists of a centre section of a span of 3.5 metres, to which the V-shaped tail-booms are fixed. The planes have two sets of struts. The boom tail, carrying the rudder and elevator, is led to the rear struts of the centre set. Mutually connected ailerons of a span of 3.31 metres are arranged at the ends of both planes. The ailerons are kept in the wing-curve direction by rubber cord, fixed on the top of the upper planes.

"A 100 h.p. Gnome monosoupape is the power plant, driving a four-bladed propeller of a diameter of 2.34 metres. The fuel tanks are placed in front of the motor behind the pilot's seat with a pivoted turnable gun in front. The empty load of the aeroplane amounts to 476 kilos, the load being 722 kilos when equipped with fuel for 2½ hours' run and with pilot and gun. The specific charge is thus 35.6 kilos per square metre.

"In spite of the resistance of the pusher type this aeroplane should at an estimation attain a speed of 150 kilometres per hour. It flies easy and is very soft on control."

Three-quarter back view of the British "Pusher" Scout.

SAFE BEHIND 'TRIPLEX'

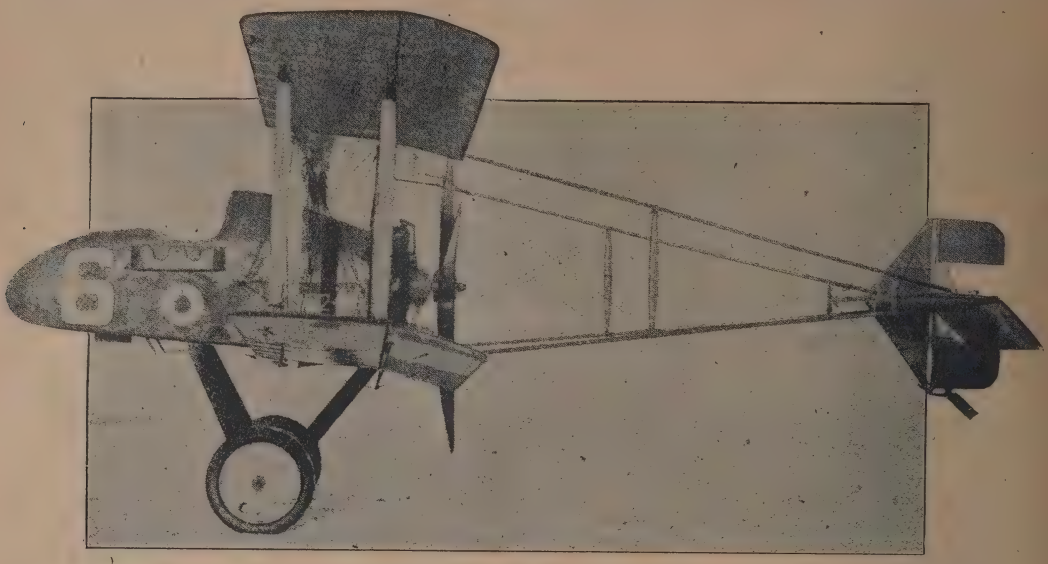
There is No substitute for **"TRIPLEX"**

The ***ONLY*** *Safety Glass.*

"Triplex is in a class by itself. It has proved its wonderful merit on active service at home and at the front. Refuse all imitations. There is only one "Triplex." Best for Goggles, Windshields, Windows, and Observation Panels in the centre section or lower wings. Successfully used and approved by H.M. Government and all leading aviators and motorists.

Telling Testimony.

"I thought you would like to see the Triplex Goggles I was wearing when I had my smash. You will see both eyepieces are cracked in innumerable places, and the force of the blow actually bent the aluminium frame. There is no doubt Triplex saved both my eyes, as they would have been done for with any ordinary glass."



Original can be seen at any time.

Investigate "Triplex." Illustrated Catalogue on request.

THE SOPWITH TRIPLANE.

In the August issue of "The German Airmen Journal" the well-known writer of aerial matters, Engineer Roland Eisenlohr, writes of the Sopwith triplane to this effect.

"Among the new aeroplanes that the war has created the Sopwith triplane holds a special position, being the first triplane to be employed on practical purposes. This type was out of date since the little successful experiments in the early years of aviation by Hans Grade in Germany during 1917, by A. V. Roe in England, and by Goupy in France, and one prophesied the type no big future. Since the American Curtiss aircraft works had at the end of last year for the first time again turned out a triplane, Sopwith has likely felt himself incited to produce too a triplane.

"The cause of falling back on this type may be foremost the small span which is made possible thereby. Perhaps Curtiss had from the start proceeded in the right design of the triplane type,

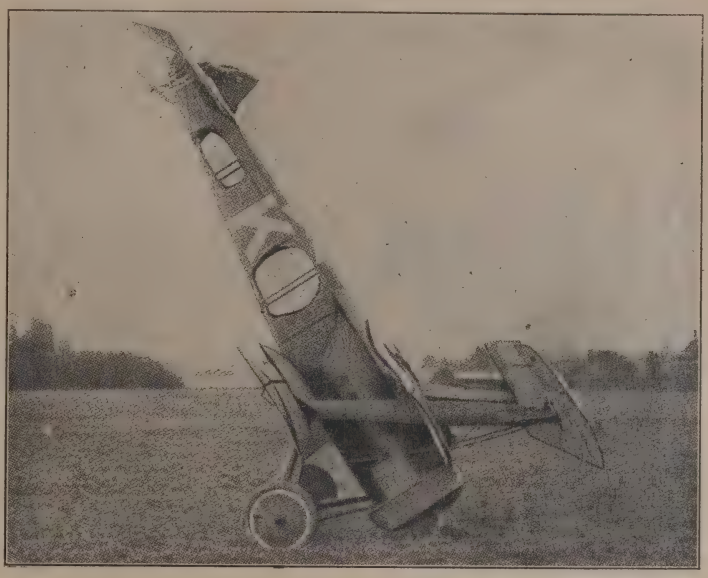
Plan View of a Sopwith Triplane.

triplane construction consists therein that the unfavourable turning it out almost wireless. Another advantage of the relation of the chord to the span turns here out better, as there is now a triple span owing to the addition of a third plane; for though the proportion shall not be less than 1.6, it has in most cases of aeroplanes of very small span to be reduced. Thus the chord amounts in the Sopwith triplane to little over 1 metre by a span of 8 metres.

"The increased head resistance of the planes is neutralised by the employment of single struts and simplified wiring. By employing the Curtiss strut construction wiring is in but one level, as is evident from the side view. By the smaller loading of the planes the main spars can finally be built pretty light and allow yet comparative large free spans, the Sopwith triplane about 2.75 metres with a free end of 1.40 metres. The weight of the total planes should therefore even be scarcely higher than biplanes of the same dimensions.

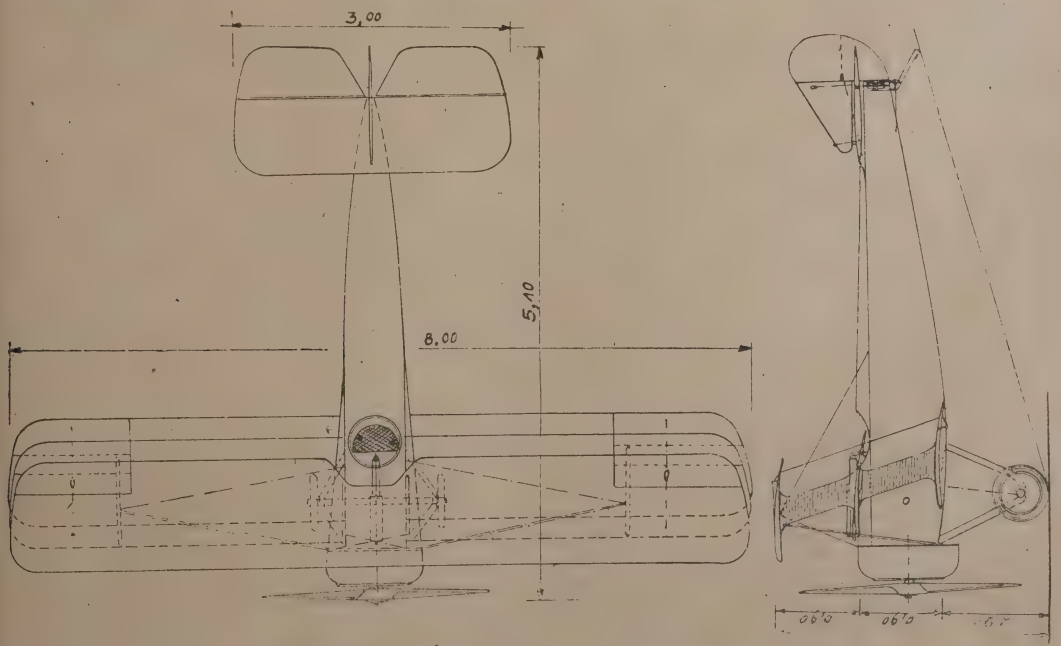
"Perhaps the plane arrangement affords the pilot a better view, as the middle plane lies in the level of the head, and the top and bottom planes hide less of the range of view by their smaller chord than the normal planes of small biplanes.

"Sopwith has a diagonal wire bteween the top and bottom strut junctions (see the below illustration), which we do not find in Curtiss, as mentioned already. While the two strain wires pass in front of the middle plane the opposite wire is pulled through the latter. A forward inclined diagonal wiring is arranged between the two inner struts, rising on the body sides, while the wires leading behind are not crossed. As evident from the scale drawings the planes are staggered about 25 per cent. at an intermediate space of 0.9 metre and all carry ailerons, connected by vertical steel bands, at their ends.



"The triplane has a small dihedral, but no arrow shape of the planes. The body carries a 110 h.p. Clerget rotary engine in front, housed in a round cowl, overhanging the body for the purpose of diverting the air.

"The body is of square section, passing over in the rounding of the motor housing forward by means of light wooden ribs to both sides. The body has width of 0.7 metre and slenders backwards to a vertical edge to which the rudder is attached with a fin in front.



"The elevator is built in two parts and has before it a fixed tail plane, 3 metres broad, the angle of which can be varied during the flight as in all Sopwith aircraft.

"The area of surface of the Sopwith triplane amounts to 27 square metres, the weight full loaded to about 670 kilos, the load of the planes being thus only 25 kilos per square metre. A high speed and a very good climb can no doubt be attained by this small load. Exact news of performance have not been published so far.

"The triplane is turned out both as single-seater and as two-seater, and is always armed with a fixed gun in front, lying on the body in the two-seated model, with a further turnable one for the observer, when the weight full loaded is increased by about 100 kilos.

Side View of a partly-burnt Sopwith Triplane.

Plan and Side Elevations of a Sopwith Triplane. Dimensioned in Metres. Reproduced from the "German Airmen's Journal."

"As in all Sopwith aeroplanes the undercarriage consists of two steel knees and of a divided wheel shaft, the links of which are tightened to the body.

"Up to this date the Sopwith triplanes are not much represented at the front and only about five or six are shot down each month. Whether it shall be engaged on the front in quantities depends likely from the experiences gained of it on active service, of which the foreign press has not yet reported."

THE AIRCRAFT INDUSTRY AND EXCISE DUTY ON PETROL.

By T. KEMP WALTON, A.C.I.S.

Under Section 85 of the Finance (1909-10) Act, 1910, any person using motor spirit for purposes other than supplying motive power for motor-cars shall be entitled, in accordance with the provisions of the section, to an allowance or repayment of the *whole of the duty* paid in respect of the petrol used. And, further, any person using motor spirit for any of the purposes mentioned in Part I of the Fifth Schedule to the Act shall be likewise entitled to an allowance or repayment of *half* the amount of the duty paid in respect of the spirit.

Included in the purposes set out in Part I of the Fifth Schedule is that of supplying motive power to a motor-car which is constructed or adapted for use, and is used solely, for the conveyance of any goods or burden in the course of trade or husbandry, and whereon "the Christian Name and Surname and place of abode or place of business of the person, or the name or style and principal or only place of business of the company or firm keeping the same shall be legibly and visibly painted in letters of not less than one inch in length."

Aviation Petrol.

Under Sub-section 3 of Section 85 of the Act, to which reference has been made, "If any person proves to the satisfaction of the Commissioners that he has within the previous six months used any quantity exceeding five gallons of spirit which is motor spirit within the meaning of the Act for purposes other than supplying motive power for motor cars, or in other circumstances entitling him to the repayment of the full amount of duty in respect of the spirit, he shall be entitled to obtain from the Commissioners a repayment of any duty which has been paid in respect of the spirit and if any person proves to the satisfaction of the Commissioners that he has within the previous six months used any quantity exceeding five gallons of motor spirit for the purposes mentioned in Part I of the Fifth Schedule to the Act, and that the full duty has been paid upon the spirit so used, he shall be entitled to obtain from the Commissioners a repayment of half the amount of duty so paid."

How to Get Money Back.

As some firms in the Aircraft Industry may not be aware that the price they pay for petrol includes the sum of sixpence per gallon for Excise duty, and that in respect of the majority, if not all, of this spirit repayment of the whole or part of the duty could be obtained, the method of claiming repayment is briefly explained:—

Application should be made to the Local Officer of Customs and Excise for copies of forms 232 and 232a, which are provided for the purpose of making claims for repayment of the full amount of duty and half the full duty respectively.

Claims must include only petrol used within a period not exceeding six months immediately preceding the date of the claim and the forms when completed must be returned to the Local Officer of Customs and Excise.

For the assistance of those filling in the forms for the first time, it may be mentioned that it is now necessary to fill in the front side only, as the particulars provided for upon the back are not now required by the Customs and Excise authorities.

Neither is it necessary to annex the Duty Certificates (which should be received with every delivery of petrol). These certificates should, however, be carefully preserved, as the officer when verifying the claim with the claimant's records, may desire to inspect them.

The records must show to the satisfaction of the Excise Officer the purposes for which the petrol to which claims relate has been used.

Repayment of the full duty of sixpence per gallon can be obtained upon all the petrol used in testing and flying aircraft, and in any manufacturing processes in connection with construction.

And a repayment of half the duty, amounting to threepence per gallon, can be obtained upon the spirit used for commercial cars and lorries upon which the owner's name and address appear. These are cars in respect of which the Local Taxation Licences need not be taken out.

No repayment of duty will be made in respect of petrol consumed by private motor-cars used by the claimant's managers and officials, although for the purposes of business only.

No difficulty will be experienced in getting claims settled if the records are clear and in a simple form.

RECEIVED			ISSUED										Balance in Stock
								Motor Cars.					
Date	Gallons	From	Date	Ref. No.	Gallons	Testing Aircraft	Manufacturing	No.	No.	No.	No.	No.	No.	

A Sample Petrol Stock Sheet.

It has been found in practice that a stock book ruled as above answers very well, as the inspector has only to check the various totals and agree them with the claims.

Abridgments of recently published Specifications.

108,155. Internal-combustion Engines. Roesch, G., 70, Avenue de la Grande Armée, Paris. June 19th, 1917. No. 8820. Convention date, June 24th, 1916. Not yet accepted. Abridged as open to inspection under Sect. 91 of the Act. [Class 7 (iii).]

Carburetting. — Float-feed apparatus for carburettors of aircraft and other engines is so constructed that the float-chamber is maintained by gravity always in the same position irrespective of the inclination of the vehicle on which it is mounted. A casing *a* is fixed with its axis at right-angles to the longitudinal axis of the vehicle and encloses a cylindrical float-chamber *e* containing a float *j* and float valve l^2. The float-chamber is mounted on ball-bearing trunnions e^3, e^4, the end of the trunnion e^3 being coned and forced by a spring *k* against a seating in the pipe a^2 which leads to the carburettor. Fuel enters the space between the casing and float-chamber through an inlet formed in the casing and having its axis at right-angles to the axis about which the float-chamber rotates. The float-chamber is maintained always in the same position by an inside counterweight *m* or an outside weight *p*, or both together, a pointer *o* indicating the relative positions of casing and float-chamber. The pipe e^3 is extended by a radial pipe e^5, and the pipe e^4, which is open to atmosphere by a radial pipe e^6. A stuffing-box is provided at *l*.

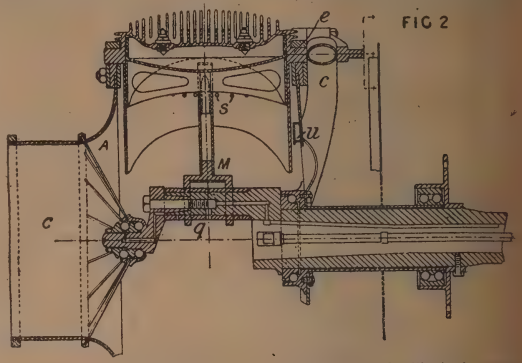

FIG 2

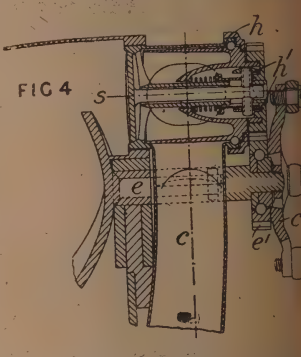
108,158. Internal-combustion Engines. Schultz, E. J. A., Chalons-sur-Marne, Marne, France. July 9th, 1917, No. 9899. Convention date, July 11th, 1916. Not yet accepted. Abridged as open to inspection under Sect. 91 of the Act. [Classes 7 (ii), 7 (iii), 7 (vi), and 122 (i).]



Four-stroke-cycle Engines; Pumps; Valves; Valve-gear; Cylinders, cooling and construction of.—Engines for aircraft have radial cylinders which revolve about a stationary crank-shaft and also oscillate about trunnions *e* adjacent their

FIG 2

closed ends. The cylinders, which may be of elliptical cross-section, carry cooling ribs on the portions of their heads facing the direction of running. Air for cooling and the formation of the charge enters the crank-casing A through a large orifice C containing fan blades, the air being subsequently carburetted by fuel supplied to troughs *u*, and then admitted to the cylinders through pipes *c*, the effect of centrifugal force in which augments the pressure of the entering charge. The combustion gases escape through terminal ports *s* and also through a combined inlet and exhaust valve S, shown in Fig. 4. Located behind the valve S, which is actuated by a cam on a gear wheel h^1, is an intermittently-rotated valve *h* which opens into the atmosphere and also to the admission pipe *c*. The valve *h* is geared to a wheel e^1 carrying arms c^1, having rollers which engage striking-plates, not shown, every half revolution. To secure the connecting-rods to the crank-pin, the rod shown in Fig. 2 is bifurcated and fixed to a sleeve *q*, the ends of the other rods being disposed three inside and three outside the end M. The ends each surround the crank-pin and have projections which engage recesses in adjacent ends to facilitate interlocking.

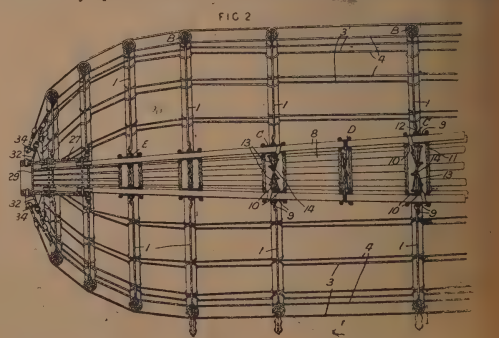


FIG 4

108,259. Aeronautics. Rooney, J., Naval Hospital, Twenty-fourth Street, Washington, U.S.A. Nov. 23rd, 1916, No. 16792. [Class 4.]

Aerial Machines with Aerostats; Aerostats.—A rigid airship, of the type comprising a tapering axial member built up of longitudinal struts secured to a series of stiffening-rings and connected by spokes to a series of external rings braced together

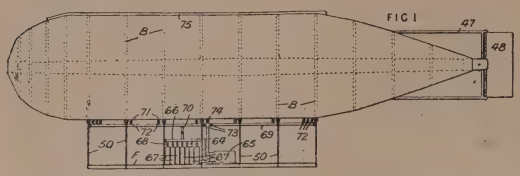
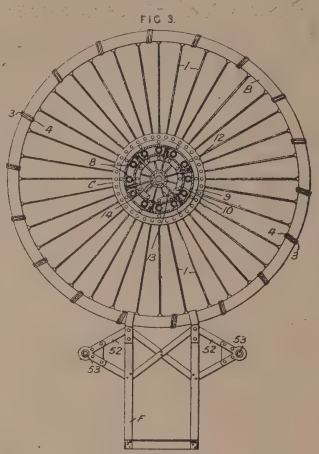
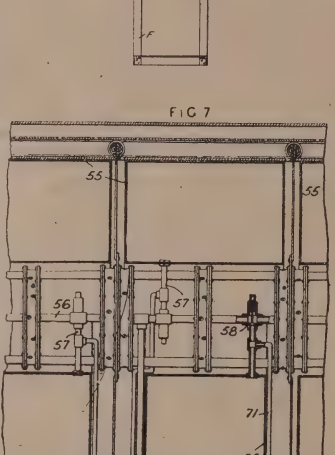
BEARDMORE
AERO ENGINES



"BEARDMORE"—a name famous throughout the world of engineering.



This historic name on AERO ENGINES is a guarantee of general excellence and highest possible efficiency.



THE BEARDMORE AERO ENGINE LTD.
London Showrooms and Depots:
112, GREAT PORTLAND STREET, LONDON, W. 1.
Telephone: Gerrard 238.

G.D.C.

by longitudinal wires, is provided with a special construction of stiffening-rings, and with a pendant car carrying means for storing excess gas from the gas-bags and for returning such gas to the gas bags when required. The axial member comprises tubular struts 5 connected by stiffening-rings C, D, E. The rings C are composed of pairs of outer and inner circular channels 9, 10, connected by end plates 11 and an intermediate plate 12, which is connected to the spokes 4 secured to external rings B. The rings 11 may be strengthened by spokes 13 attached to a hub 14. The rings D, E are of similar construction, the former being without intermediate plates. The ends of the axial member abut against end plates 29 of caps 27, which carry anchoring-plates 32, 34 for the ends of the outer and inner series 3, 4 of longitudinal wires, which are coiled round the rings B. Excess gas from the gas-bags may be compressed into containers 67, Fig. 1, by means of pump 65, from which lead pipes 64, 66, the former being connected through valves 73 with a feed-pipe 69 and through a valve 74 with an exhaust pipe 56, Fig. 7, and the latter being connected through valves 68, Fig. 1, to the containers 67 and by a pipe 70 to the feed-pipe 69. The gas-bags, 55, Fig. 7, are connected by pipes 57 to the exhaust pipe 56 through spring-controlled valves 58 adapted to open automatically when the pressure in the gas-bags exceeds a certain amount. Branch pipes 71 lead from the pipes 57 to the feed pipe 69 and are fitted with valves 72. When excess gas is to be pumped into the containers, the valve 74 is opened and the valves 73 closed; but when gas is to be pumped back to any of the gas-bags, the valve 74 is closed and the valves 73 and the appropriate valves 72 are opened. A ventilating-hood 75, Fig. 1, open at each end is provided along the top of the airship. Fins 47 and a rudder 48 are fitted at the stern.

Cars.—The car F may be constructed of angle-iron, the uprights 50 being secured to the rings B of the airship frame.

Propelling.—The propeller shafts are mounted in bearings 53, Fig. 3, in brackets 52 secured to the car F.

A.G.S. PARTS.

Aircraft constructors should note that Brown Brothers of Great Eastern Street hold large stocks of A.G.S. No. 136 Thimbles, and quantities can be supplied from immediate stock at distinctly competitive prices. Large deliveries of all sizes, passed A.I.D., can be supplied at very short notice.

MARKET REPORTS.

Prices given are for quantities on usual terms.

September 27th, 1917.

COPPER.—The authorities in America have now fixed the price of copper at 23½ cents f.o.b., subject to revision in four months' time, this price also to be charged to the Allies. This certainly can be considered a fairly liberal price and should remove any possibility of output suffering in consequence of price. The question of output is certainly a very serious consideration at the present time. The refineries are short of raw copper owing to the various strikes, and the stocks which they had accumulated are rapidly diminishing; on the other hand, the consumption is reaching abnormal figures. One still hears reports of the possibility of the United States Government endeavouring to restore peace, but nothing definite appears to have been done, and in any case it will probably take months before the maximum production is reached.

As foreshadowed in The Aeroplane of September 5th the authorities here have reduced the price Standard £10 to £9 10s. This, of course, has been rendered necessary owing to the U.S. price having cut the price ruling here.

Comparative Prices.

To-day	£110 per ton.
Last month	£120 per ton.
Last year	£116 per ton.
1916 highest	£153 per ton.
1916 average	£116 per ton.

TIN.—There is still a very apparent feeling of uncertainty about this market. After declining from £246 5s. September 17th to £243 September 20th, the market became rather lively and prices have advanced to £247 10s.

It is reported that large shipments of tin are arriving, and when they are delivered the situation should be eased, although in view of the anticipated rise in freights, buyers will probably endeavour to secure as much near tin as possible.

Comparative Prices.

24th September	£247 10 0
20th September	243 0 0
14th September	245 5 0
Highest prices, 1916	205 0 0

LEAD.—Regarding the recent order giving the Ministry of Munitions authority to take possession of all Pig Lead, Old and Scrap Lead and Lead residues, the regulations applying to White Lead, Red Lead and Lead Compounds appear to have been misunderstood. Where White Lead, Red Lead or Lead Compounds are required for urgent repairs or renewals, they can only be purchased or used after a special licence has been procured from the Ministry of Munitions authorising the sale.

One understands that these licences will only be issued where there is definite proof that damage to property will result if the material is not supplied. Official prices remain the same, and it is now "up to" the Ministry to see that firms requiring Lead for national purposes are kept supplied. For Prices see Prices Current List.

STEEL.—Supplies appear to be steadily increasing and the general feeling that the output would be in excess of the demand by the end of the year looks like being realised; of course, a great many things may happen before then.

The price of American Semi-Steel has been reduced £4 per ton, but even a large reduction like this does not bring the price within reasonable limits; furthermore, one understands that the American authorities have prohibited the exportation of iron and steel. There does not therefore appear to be any hope of American supplies relieving the general steel situation.

The Swedish position remains unsettled; this, of course, principally affects Cast Steel, and although the supplies of Ore received from Sweden were only small, they were very helpful. Should the authorities here decide to prohibit any exportations to Sweden, it is only natural to expect that our Ore imports from there will cease.

For Prices see Prices Current List.

TIMBER.—One now learns that the question of a substitute for Silver Spruce has been settled. No official instructions appear to have been issued, but we should not be surprised to learn that a formerly discarded wood was decided upon. Makers used this wood in the early days, and it apparently gives excellent results, although it does not possess all the splendid features of Silver Spruce. By the way, it would be interesting to know what the authorities intend doing with all the Spruce which was imported for aircraft work. One is given to understand that although this material was passed by three Government Inspectors, it was found upon arrival to be nearly useless for the purpose for which it was purchased.

There have been several loads of Mahogany and Walnut received during the past week. Supplies of the latter are, however, still very small compared with the demand.

Prices remain very firm; for present prices see Prices Current List.

STANDARD AUTOMOBILE SCREW THREADS.

By V. P. Benedict.

A MEMO BY WAY OF CAUTION AND ADVICE.

There appears in many directions a very considerable degree of misunderstanding as to what particular schedule is referred to in the term "Standard Automobile Screw Threads" now frequently applied to aeroplane components on the drawings thereof.

Which uncertainty, doubtless, arises from the fact that the British schedule of Automobile Screw Threads has only recently been officially adopted, so it has not yet had time to make its appearance in existing text books, whereas in most there does appear the older schedule [pronounced in U.S. "skedool."—Ed.] of the American Society of Automobile Engineers, known as S.A.E.

These two schedules—British and American—are totally distinct and differ essentially in form and dimensions.

BY WAY OF CAUTION—

To militate against the possibility of what may conceivably be very expensive mistakes, arising from the cause just mentioned, one recommends to the notice of all concerned, for their own benefit, to be read and noted for future reference, the definite intimation that any term such as "Automobile" or "Standard Automobile" applied to screw threads appearing on aircraft or other drawings and specifications of British design and origin must be taken as referring to the British Standard Automobile Screw Thread Schedule, and *not* to the S.A.E. or Society of Automobile Engineers (of America). [Which now calls itself the Society of Automotive Engineers.—Ed.]

—AND OF ADVICE.

The officially adopted British Automobile Standard Screw Thread Schedule consists simply of sizes ¼ in. up to 1 in., of the British Standard Fine Threads (B.S.F. or B.F.T.) plus numbers 2 and 4 British Association (B.A.) Screw Threads.

The fullest particulars, both of the British and American Standards for Automobile Screws, were included in the detailed Tables of Screw Threads printed in THE AEROPLANE (Aeronautical Engineering Supplement) under issue date September 5th last.

V. P. B.

[It should be noted that copies of the Screw Thread Table compiled by Mr. Benedict, published in this paper recently, and giving full particulars of all the screw threads in use on aircraft, may be obtained from this office on paper suitable for framing or posting up on notice boards, for three penny stamps.—Ed.]

ALEXANDER'S DESIGNS.

From the "Daily Telegraph" of Sept. 19th:—

At Bow Street, on Sept. 18th, before Mr. Graham Campbell, Faedo Cokinaki, aged 29, said to be of Greek nationality, described as a clerk, residing at Elgin Avenue, Maida Vale, was charged with stealing, on Sept. 7th, from an office at Charing Cross Mansions, Charing Cross Road, eleven plans relating to the manufacture of aeroplanes, and four files of letters, valued together at £200, the property of William J. H. G. Browne, A.M.I.C.E., of the firm trading as H. Alexander and Co.

Mr. F. H. Adams, solicitor for the prosecution, explained that Messrs. Alexander and Co. were civil engineers, and had for some time been engaged in patenting and designing aeroplanes and constructing hangars. The defendant occasionally visited their offices, and was there on Sept. 7th whilst Mr. Browne was engaged at work on his plans. Next morning, on returning to his office, Mr. Browne missed the plans and other papers mentioned in the charge. On Sept. 10th he met the defendant, and told him he suspected him of having taken them. Defendant made some reply to the effect that if Mr. Browne could get him payment of a sum of £27 10s. he might be able to tell him where the plans were. Mr. Browne then gave information to the police, with the result that the defendant was arrested.

Mr. A. E. Burton, solicitor, who said he had only just been instructed to appear for the defendant, intimated that his client, who had acted as he had done under an entirely mistaken view of his rights, was prepared on his advice to plead guilty if the magistrate would deal with the case.

After some discussion Mr. Graham Campbell declined to deal with the case, and said defendant must go to the sessions for trial. He agreed to accept bail for his appearance.

AIRCRAFT FINANCE

VOL I. No. 2. ISSUED AS A SUPPLEMENT TO "THE AEROPLANE"

CURRENT INFORMATION.

THE COMPANIES (PARTICULARS AS TO DIRECTORS) ACT, 1917.

An important addition to the Companies (Consolidation) Acts received royal assent on August 2nd, 1917, which affects every company incorporated on and after November 22nd, 1916, and, in view of the fact that aviation companies are necessarily of recent incorporation, the following particulars are of very great importance to the aeroplane industry. This legislation was enacted to circumvent the manœuvres of concerns in the United Kingdom, carrying on business under trading styles which afforded no real indication of the nationality to the principals. In December, 1916, when the registration of the Business Names Act was passed, a large number of trading and manufacturing concerns were immediately converted into private companies, with the object of avoiding disclosure of the nationality of their principals, by the cover secured under the Limited Companies Acts. It was at once recognised that by omitting to bring limited companies within the scope of the Business Names Act it permitted if not actually invited those to whom its provisions were unwelcome to convert their businesses into companies, and thus defy the objects for which the Act was passed. The new Act now compels every company registered since November 22nd, 1916, to furnish to the Registrar of Joint Stock Companies the Christian name or names and surname of every director, any former Christian name or names or surname, nationality or origin (if other than the present nationality), the usual residence and occupation of every director. A novel feature of the Act is the definition of what is meant by "Christian name," which is declared by Section 22 of the Business Names Act to cover any forename, and to include members of any non-Christian religion. Hitherto a director's address filed with the Registrar has been accepted as that of the company, but by the new Act the address at which the director "habitually resides" must be given. Under this new Act a director is further called upon to disclose any separate business that he may be interested in or carrying on. Secretaries, directors, and other officials are also notified that any change of director, residence, or occupation must be filed with the Registrar. A wide meaning is given to the expression "director." Section 3 of the present Act is as follows:—

"For the purposes of this Act and of Sections 26, 75, and 274 of the Companies (Consolidation) Act, 1908, as amended by this Act, the expression 'director' shall include any person who occupies the position of a director *and any person in accordance with whose directions and instructions the directors of a company are accustomed to act.*"

Another important point in the Act is that in the case of those companies to which the obligations apply it will now be necessary to set out the names of the directors in all "trade catalogues, trade circulars, showcards, and business letters" in which the name of the company appears, and which are issued or sent to any persons in any part of His Majesty's Dominions. Default in complying with these provisions renders every director, secretary, or other official of the company, who is knowingly a party to the default, liable to a fine of £5 for each offence. Company officials are advised to make themselves conversant with the requirements and obtain the requisite forms without delay.

The Treasury and New Issues.

Last week the official notice issued by the Lords Commissioners of the Treasury, through the medium of the Press Bureau, was given in these columns, and I pointed out that the New Issues Committee will have to revise their present policy if Treasury regulations against unauthorised new issues are to be observed and enforced. These remarks receive ample justification by the publication since this article was written of the annual report of the Controller of the Companies Department of the Board of Trade which has just been published. This report, which deals with the companies registered during the past year, shows that three thousand and eighty-one companies were registered, representing roughly forty-five and a half millions sterling, of which only one hundred and forty companies, representing a total of under the odd five and a half million pounds, were issued by prospectus to the public, clearly showing that close upon three thousand companies, representing in the aggregate over forty millions sterling, were "issued" without a prospectus, consequently, subscribed privately without Treasury approval or consent. In these days of stress and difficulty such a state of affairs ought not to exist, and demands the earliest attention of the authorities.

A Note for the Intelligent Investor.

In the course of a speech made by the Paymaster-General, Sir J. Compton Rickett, at Coventry last week on the subject of the future of the Aircraft industry, this Government official made a statement which must have a very important bearing on the future of Aircraft Finance. In the course of his remarks he stated:

"The aircraft of the future would come not in forties and fifties, but in hundreds and thousands. Chemistry would lighten their weapons, reorganisation of the Air Fleets would include stores, munitions, even ambulance craft, as well as fighting machines; there would be no fortresses to obstruct, no railroads to lay, no rivers to cross, the fate of an Empire might be decided in a fortnight."

Mr. Percival Gibbon, writing in the *Daily Telegraph* on the subject of the Italian Caproni, Says:—

"I asked the aviators, in view of Laureati's success, what they thought of the prospects of those Caproni fliers in America who are to make an attempt to fly the Atlantic. One and all were enthusiastic about it. They

pointed out that by choosing starting and landing places the passage could be done with only about a thousand miles of water to cross. We have already machines which normally go into action with a crew of four men, besides a cargo of bombs. By reducing the crew to two and substituting the bombs and the other two men by extra fuel supply, the thing is obviously possible." They laid stress on the value of multiple engines, and quoted the case of an aviator flying a three-engined machine, which got back safely, though two engines were out of action. 'We shall all be mail-carriers after the war,' said one of them."

This should give the intelligent investor food for reflection.

THE WELLS AVIATION COMPANY, LTD. (*In Liquidation*).

A meeting of the creditors of this company was convened and held at the Cannon Street Hotel on Tuesday, September 25th, at which Mr. H. M. Marriott (solicitor), acting for Mr. Wells, presided. The chairman complained on Mr. Wells' behalf that a proposal submitted by him had not been accepted by the liquidators. The company, it appears, was in financial difficulties in the early part of the year and went into liquidation on May 11th. It was reported that the liquidators had been negotiating with various parties, but all with one exception had proved abortive, and even this group withdrew their offer on the very day that a meeting of the committee was convened to consider the proposal. It appears, however, that on that same day the Aircraft Trust, Ltd., approached the liquidators and propounded a scheme under which the debentures would be dealt with, and would give the creditors approximately 10s. in the £. This was the only proposal before the committee, who comprise nine of the largest creditors, and whose debts total about £20,000. The committee authorised the liquidators to accept the proposal, which I understand they have done, and a deposit of £15,000 has been accepted. The alternative proposal subsequently submitted by the chairman was for the payment to the creditors of 6s. 8d. in the £, the balance to be "secured," but no information was given as to what form the security would take. The chairman suggested it would probably be a second debenture. This gave rise to some very sarcastic and pointed comment. A resolution of confidence in the liquidators was proposed, and an amendment in support of the alternative scheme was also proposed and seconded. The chairman then made reference to certain proxies he held, but it was pointed out from the body of the meeting that to use proxies held on behalf of absent creditors who could have no knowledge of the position without having heard the facts would be a very questionable proceeding, and it was proposed and seconded that the proxies be not used. A solicitor thereupon rose and expressed disgust at the attitude adopted by the chairman, and suggested that the meeting should disperse without considering any further resolutions, whereupon practically the whole of the meeting withdrew. I understand that as soon as the creditors' claims have been agreed, a first distribution will be made of 5s. in the £ to the creditors.

G. A.

NEW COMPANY REGISTERED.

Manchester Aircraft Company, Ltd., registered September 24th, 1917; nominal capital, £5,000 in £1 shares. Registered offices, 29, Cooper Street, Manchester.

ANSWERS TO CORRESPONDENTS.

A Financial Specialist will be pleased to answer in these columns inquiries on any subject affecting or relating to Investments, Stocks, Shares and Securities of Aircraft and kindred companies, free of charge.

"Novice" (Halifax).—It is specifically set out in the Companies Acts that a holder of debentures shall have the same right to receive and inspect the balance-sheet and reports of the Company as is possessed by the holder of Ordinary shares. If these documents are not regularly sent to you, you would be entitled to claim them from the Secretary of the Company. The reading of the Section of the Act, whilst specifically stating that the holders of Preference shares and debentures shall have the same right as is possessed by the holders of Ordinary shares, restricts the right to balance-sheets and reports. You would therefore not be entitled to receive notices of meetings.

"Nemo" (Worcester).—The only obligation on a Company to employ an Auditor is embodied in Section 26, Sub-Section 3 of the Companies Act, which provides that a balance-sheet shall be filed annually with the Registrar of Joint Stock Companies, which shall be audited by the Company's Auditor. There would appear to be some looseness in the wording of this point of law, as it does not define what is an Auditor. Many expert book-keepers and accountants might with very good reason adopt the title, whereas the Act undoubtedly intends that the Company's Auditor should be a member of one of the Institutes, but specially exempts Private Companies, and Section 113 sets out the rights and duty of an Auditor very clearly. However, as a Private Company is specially exempted from filing a balance-sheet, it would appear that such a Company is not legally compelled to employ the services of an Auditor.

"Investor" (Brighton).—No doubt the delay in the issue of the certificates is due to the common cause from which all offices just now are suffering, that of depleted staffs. In normal times share-certificates are usually prepared and delivered in twenty-one days. At present the preparation of new certificates generally demands one month, but for all practical purposes the transfer receipt which you hold covers your position.

"A Flyer" (Norwich).—The present quotation is "ex-div." consequently a purchase at the present moment would not entitle you to receive the dividend just declared, as this dividend would be the property of the seller.

October 2, 1917.

A NEW AIRCRAFT COMPANY.

One takes pleasure in announcing the formation of a new firm, to be known as Wycombe Aircraft Constructors, Ltd., whose operations are to be centred at Wycombe, Bucks.

One understands that Mr. G. Holt Thomas takes a controlling interest in the new concern. Mr. F. H. Payne, late of the Grahame-White Aviation Co., Ltd., has been appointed managing director, Mr. E. Ritchie, A.M.I.M.E., A.M.I.E.E., will be resident general manager, and Mr. T. Kemp Walton will be the resident secretary of the company.

The furniture making industry at Wycombe should be able to supply first-class labour for aircraft construction, and an important addition to the supply of aeroplanes will take place as soon as the new works are set going.

(Continued from page 950.)

WELCH.—Lt. Hugh Welch, R.F.A. and R.F.C., killed in an air fight on March 28th, was the eldest son of Thomas Hulme and Margaret Welch, Eltham, S.E.

WHITE.—Capt. Lewis Scott White, M.C., who was killed in a flying accident at Wantage on Sept. 28th, in his 22nd year, was the youngest son of Mr. Edmund White, M.B., of Green Park, Bath, and was educated at Victoria College, Grosvenor. He always took a keen interest in aviation, and was a prominent member of the Bath Aero Club. He entered the R.F.C. as a mechanic in October, 1914, and, receiving a commission, was gazetted Captain on May 5th last. It was only last Wednesday that he attended an Investiture at Buckingham Palace, and was decorated by the King with the M.C. For the last two months Capt. White had been Flight Commander of a flying squadron training at home, but was returning to the front in a few days.

It is stated that a new machine was being sent to an aerodrome, and the pilot having engine trouble descended near Wantage. Capt. White later arrived from the aerodrome and went up in the machine. Soon afterwards the aeroplane crashed to earth, and the officer died almost immediately after being extricated from the wreckage.

WHITTALL.—Sec. Lt. Noel Charles Whittall, Royal Fusiliers, attached R.F.C., who was killed on Sept. 13th, was the eldest son of Mr. and Mrs. F. J. Whittall, of 11, Torridon Road, Hither Green, S.E. Born in 1896, he was educated at Claremont House School, afterwards passing to St. Dunstan's College, which he left at the age of 17 to enter the works of Messrs. Elliott Brothers, Limited, electrical engineers, of Lewisham, remaining there until taking a commission in June, 1915. After seeing active service on the Western front for twelve months he transferred to the R.F.C., and came home last July to complete his training, leaving again for the front on August 14th last. Early this month in an air fight he encountered four enemy aeroplanes, and after firing 200 rounds of ammunition succeeded in bringing down a Hun machine and dispersing the remainder.

His squadron commander writes:—"He is one of the greatest losses that my squadron could have sustained. Although he had been with me such a short time I realised what an excellent fellow he was. His keenness reflected itself in his work, and he was getting on exceptionally well."

Marriages.

BOSTON—WOOD.—On Sept. 21st at Wolvercote, Church, near Oxford, William Harold Boston, Sec. Lt., R.F.C. (late Suffolk Regt.), eldest surviving son of the late John Boston, of "St. Wyburn," Birkdale, was married to Lucy Maria, daughter of the late Dr. James Wood and of Mrs. Wood, Grove House, Southport, by the Rev. A. J. Carlyle, D.D.

HAWKSLEY—McCLEARY.—On Sept. 18th, at St. Osburg's, Coventry, Sec. Lieut. Gerald Eugene Hawksley, R.F.A., attd. R.F.C., elder son of the late Mr. and Mrs. Robert Paton Hawksley, of Nottingham, was married to Violet Mary, third daughter of Mr. and Mrs. W. J. S. McCleary, of Smarden, Kent.

HOUSDEN—PRITCHARD.—On Sept. 22nd, at the Baptist Chapel, Whitstable, Lieut. R. J. Housden, R.F.C., only son of the late Mr. J. A. J. Housden, late of the G.P.O., and Mrs. Housden, of 19, Compton Road, Canonbury, was married to Maud Elizabeth, elder daughter of Mr. and Mrs. George Pritchard, of Whitstable, by the Rev. J. Wallis Humphreys.

MORTON—BOWDEN.—On Sept. 22nd, at St. John's Church, West Ealing, Capt. Gerard Hume Morton, of Victoria, B.C., Canadian Infantry, attached R.F.C., son of Capt. A. W. Morton, Canadian A.S.C., was married to Norah, fifth daughter of the late Frank Meno Bowden, of Madras, and Mrs. Bowden, of 109, Uxbridge Road, Ealing, by the Rev. James Summerhayes.

SMART—IRWIN.—On the 26th inst., at St. Paul's Church, Kersal, Capt. C. D. Smart, M.C., R.F.C., second son of the late Arthur Smart, of Kersal, was married to Helena May, only daughter of Mr. and Mrs. Henry Irwin, of Chorlton-cum-Hardy, formerly of Melbourne, Australia, by the Rev. Reginald Petch, M.A.

YATES—TILDEN-SMITH.—On August 29th, Major H. T. F. Yates, M.C., R.F.C., was married to Yvonne, youngest daughter of R. Tilden-Smith and Mrs. Tilden-Smith.

Births.

BIRD.—On Sept. 23rd, at 13, Colville Mansions, Bayswater, W., to Clarice Rosalie, the wife of Sec. Lt. C. O. Bird, R.F.C., a son.

MACMASTER.—On Sept. 24th, 1917, at Tower House Nursing Home, Crouch Hill, N., the wife of Cadet R. E. G. Macmaster, R.F.C., of a daughter.

RODWELL.—On Sept. 23rd, at Lincoln, the wife of Major J. T. Rodwell, R.F.C.—a son.

WOOD.—On Sept. 24th, at Danes House, Aldeburgh, Suffolk, the wife of Capt. F. J. Wood, R.F.C. (and of the Indian Finance Dept.), of a daughter.

Mrs. Archibald I. Orr-Ewing has received news unofficially via Amsterdam that her husband, Sec. Lt. A. I. Orr-Ewing, Yeomanry, attached R.F.C. (officially reported missing on Sept. 20th), is unwounded and a prisoner of war in German hands.

* * *

If any officer or man can give any information, or if relatives of prisoners of war in Germany would ask for news of Sec. Lt. E. H. P. Streather, R.F.C., who was reported missing on Sept. 11th, the same would be gratefully received by Mr. Streather, of D'Arcy House, Finchley Road, Golder's Green, N.W.4.

* * *

News of Lieut. A. J. C. E. Phillippo, R.F.C., whose machine fell near Hollebeke, in the German lines, June 7th, will be gratefully received by his mother.—Box E.980, "The Times."

* * *

Mr. Bonar Law has been informed that his son, Captain J. R. Law, R.F.C., is missing.

Captain Law, who is the eldest son of the Chancellor of the Exchequer, joined the Royal Fusiliers at the outbreak of the war, and then transferred to the Royal Flying Corps, in which he has been serving for two years.

* * *

Lt. John Knight, R.F.C., grandson of the Rev. B. Knight, of Torquay, has succeeded in making his escape from Germany. He was compelled to descend behind the German lines in Flanders some time ago, and was captured. On the occasion of his first attempt to escape he remained free for three days, being discovered as he lay asleep beneath a heap of straw in a stable. The second attempt proved a complete fiasco, Mr. Knight being shot in the leg before he had got clear of the place of detention. Profiting by experience, the third attempt was successful, and he reached the frontier after ten days' thrilling adventures, which included the swimming of a wide river.

A special correspondent of the "Morning Post" writing on September 26th of the recent advance east of Ypres, says:—"The surveillance of his counter-attacks since last Thursday's advance has undoubtedly flurried the enemy. He has shifted troops in an unusually extravagant manner, altering their routes repeatedly to try to avoid our guns; but they have been followed from route to route and back again, and punished all the way.

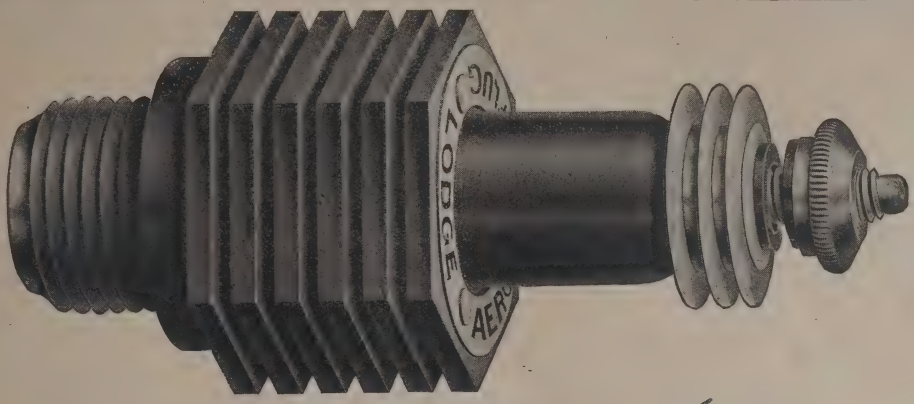
"Of nine counter-attacks made on September 20th only three were able to get within rifle or machine-gun range. Those delivered yesterday were harassed by airmen, as well as the batteries. Our aeroplanes were thick over the enemy areas around Zandvoorde and Gheluvelt last night, and the whole were made hideous with every kind of bomb and shell.

"The German Staff apparently thought something of the kind was in store for them to-day, and the fighting in the air yesterday was unusually severe in consequence. Our 'low flyers' were up and down our lines from noon onwards, and others went further afield. The reports they brought back were convincing enough—in the language of one of my informants, 'the Huns had the jumps.'

"They had reason. The activity of our airmen alone is sufficient to keep their infantry in a state of nerves. The other night the raiders went out with flares and found the Menin road full of troops coming up to take part in the new counter-offensive. They made some thirty attacks with their bombs and machine-guns, lighting up the crowded highway 'like a circus,' and came back before dawn to say that they had had the time of their lives."

FRANCE.

Official Communiqués.



Sept. 25th.—Three German aeroplanes were brought down during the day yesterday by our pilots.

Our aeroplanes carried out various bombardment operations in the daytime yesterday and in the course of last night. Ten thousand kilograms (about 10 tons) of projectiles were dropped in the course of these expeditions, especially on the railway stations of Cambrai, Luxemburg, Longuyon, Brieulle, etc. Several fires broke out in the bombarded buildings.

Army of the Orient.—There was great activity by the artillery and aviators on both sides.

Sept. 26th.—On the 25th inst. two German machines were brought down after aerial fighting and two others were seriously damaged.

The railway stations of Roulers and of Lichtervelde, in Belgium, the hutments of Nantollois (north-west of Verdun), the

of Plates, Gauges and Dials for Aeroplanes, etc., etc.

Write for our "A" List.

stations Brieulles (north of Nantollois), Metz, Woippy (near Metz), etc., have been plentifully bombarded by our squadrons.

Army of the Orient.—British and Serbian aviators successfully bombarded enemy cantonments in the neighbourhood of Demirhissar (Struma front), Doiran, and Nonte (west of the Vardar).

Sept. 27th.—Army of the Orient.—British aviators bombarded the enemy encampments in the region of Doiran.

Sept. 28th.—In spite of unfavourable atmospheric conditions our bombarding squadrons during the night abundantly showered with bombs the aviation grounds of Marville (south-east of Montmédy) and Mars la Tour (west of Metz), the railway stations of Brieulles (north-west of Verdun), Fléville (west-south-west of Brieulles), and Romagne sous les Côtes (north-north-east of Verdun), and the cantonments of Peuvillers and Sivry-sur-Meuse (north and north-west of Verdun respectively). All the objectives were attained.

Sept. 29th.—German aeroplanes bombarded the region of Bar-le-Duc.

On Sept. 27th two German aeroplanes were brought down by our fire. During the night of the 27th our squadrons bombarded the aviation grounds at Staden, Roulers, and Cortemarck, and the camps in the vicinity.

Sept. 30th—Some German aeroplanes bombarded the region of Dunkirk on the 27th, 28th, and 29th. The two first bombardments only caused material damage.

The last, which was particularly violent, resulted in the death of several civilians.

Two German machines were brought down by our pilots during the day of the 29th.

During the night of the 28th the railway station of Colmar and the enemy establishments to the north of Soissons were visited by our aeroplanes. Four tons of bombs were dropped with success.

Oct. 1st.—The enemy's aircraft last night bombarded the region of Bar-le-Duc, inflicting material damage and causing several casualties.

During the day yesterday five German aeroplanes were brought down in air fights, and seven other enemy machines fell out of control into their own lines.

Our bombarding squadrons dropped bombs on the railway station and cantonments of Fresnoy-le-Grand, where violent fires were seen to break out, on the railway stations of Thionville, Mezières, and Dieuze, and on the works of Hagondange.

As a reprisal for the bombardments carried out by the Germans against the open town of Bar-le-Duc, two of our aeroplanes last night dropped three hundred kilograms of bombs on the fortified city of Stuttgart.

In Belgium we bombarded the aerodromes in the Roulers and Thielt regions, the railway stations of Lichtervelde, Staden, Cortemarck, etc.

It was reported from Paris on Sept. 25th that Captain Guynemer is missing. He started on a reconnaissance over the Flanders front on the morning of Sept. 11th, and became separated from the comrade with whom he was patrolling while chasing some enemy aeroplanes. He has not been seen since. Every possible means of throwing light on his fate had been tried without result.

Captain Guynemer was the champion "ace" of the French Army. He had brought down fifty-three German machines. One of the most characteristic of his recent feats was to force a German aviator to land and surrender behind the French lines, although Guynemer had not a single cartridge left. He accomplished the feat by sheer mastery of flying and terrorising his enemy. Captain Guynemer flew over and under the German machine, heedless of the German aviator's bullets, and forced him to drop to a lower level, completed the circle, and then passed over the German machine again. He repeated the performance until the amazed German gave up and landed. The whole time he expected to be riddled with bullets as Guynemer passed him. The German never suspected until he was told that the reason his adversary did not fire his machine gun was that he had not a cartridge left.

Another of Guynemer's feats was having his photograph taken while attacking a German machine. He and another pilot went up together and found a Hun, whereupon Guynemer assumed his favourite position of attack, while the other pilot flew wide and photographed the two other machines, with Guynemer a few feet from the Hun's tail. When the photographs were taken he signalled to Guynemer, who promptly shot the Hun.

Guynemer, despite all his promotions and decorations, was one of the quietest and most modest of men, and quite unlike a "star" of any kind. Consequently he was immensely popular with everybody who knew him. He has been badly wounded at least twice; on one occasion, it is said, when trying a new gun, with which he brought down two Germans in the first two shots, and which blew out its breech-block in his face at the third shot.

Guynemer was born in Paris on Dec. 24th, 1895, and was a student at the Ecole Polytechnique when war broke out. He tried to join the Army, but was refused on account of delicate health. Finally he succeeded in entering the Aviation School at Pau as a pupil-mechanic. After a short training as a pilot, he left for the front on June 8th, 1915, to join the "Stork" squadron, in which he soon distinguished himself by his courage. A month after his arrival at the front he brought down his first enemy aeroplane. Recently he brought down in a single day his 51st, 52nd, and 53rd enemy aeroplane.

The "Journal" says:—Finally, on Sept. 11th last Guynemer started on a flying expedition at 10.30 a.m., and encountered a whole squadron of enemy chasing aeroplanes. He might have avoided a fight, but such a thing never entered his head. He made straight for the enemy and brought down two. He was, however, overwhelmed by numbers, and fell with his machine into the sea.

Other accounts say that he fell in the Forest of Houlthoulst. Some say he was seen attempting to land, and others that he fell out of his machine.

The correspondent of the "Cologne Gazette" (Sept. 28th) on the Western front says that, according to the "Gazette des Ardennes"—which is under German control—Capt. Guynemer was killed on September 11th about 800 yards east of the cemetery of Poelcapelle. A German serjeant found there a one-seated machine with a wing broken and the pilot dead from a bullet wound in the head, and on him an identity disc with the name, Georges Guynemer.

* * *

Writing on Sept. 27th an expert French commentator says:—

The British aviators during this fighting showed particular victorious activity. They used their machine-guns on marching troops from a low height, and bombed the enemy military organisations. The importance of aviation is emphasised in each new offensive. The German communiqué naturally shows a subtle discretion on the results obtained by our Allies, but it, nevertheless, partially confesses them.

* * *

From the "Times of Sept. 29th:—

During the past few days there have been disputes about wages in French aeroplane factories. An arbitration award, given on September 20th by the Permanent Committee of Conciliation and Arbitration of the Seine, has, however, been accepted by both parties. The further questions of wages for skilled female labour and for unskilled labour are to be settled without delay.

* * *

DONZE—MACKENZIE PENNY.—On Sept. 25th, at St. Joseph's Church, Newton Abbot, Robert Louis Donzé (Brigadier-Pilote, French Aviation Corps), youngest son of Mr. and Mrs. Donzé, of Santa Barbara, California, U.S.A., was married to Gladys Isabel Mackenzie, only daughter of the late Don Mariano and Mrs. Penny, of Aberdeenshire, N.B., by the Rev. Thomas Barney.

GERMANY.

Official Communiqués.

Sept. 25th.—Last night our aviators attacked England.

Bombs were dropped on military buildings and warehouses in the heart of London, on Dover, Southend, Chatham, and Sheerness. Fires gave evidence of the effect.

All our machines returned undamaged.

Dunkirk was also attacked with bombs.

Western Front.—The enemy lost 13 aeroplanes. First Lieut. Schleich won his 22nd and 23rd aerial victories, and Lieut. Wüsthoff his 21st.

Sept. 26th.—In the evening our aviators again attacked London and the English (sic) coastal towns on both sides of the Channel.

Bombs dropped on Ramsgate, Margate, Dover, as well as on Boulogne, Calais, Gravelines, and Dunkirk, were observed to have incendiary effect.

One of our aeroplanes did not return.

On land the enemy lost 15 aeroplanes yesterday. Ober Lieut. Berthold brought down his 24th adversary in aerial battle.

Sept. 27th.—Seventeen enemy aeroplanes were brought down yesterday.

The bombardment of Ostend in the night of September 25th-26th, apart from damage to buildings, demanded sacrifices also from the population. Fourteen Belgians were killed and twenty-five seriously wounded.

Sept. 28th.—As the result of successful battle flights during the last few days 1st Lt. Berthold brought down his 25th opponent, Lt. Wüsthoff his 22nd, and Lt. von Bülow his 21st. 1st Lt. Waldhausen yesterday succeeded in bringing down one aeroplane and two captive balloons.

Oct. 1st.—English and French aviators, by the dropping of bombs, recently wrought considerable material damage in Belgium territory, their attacks also causing numerous victims amongst the civil population.

"Our aviators again dropped bombs upon the military build-

ings and warehouses in inner London. Numerous fires showed this attack to be particularly effective.

"Other aeroplanes successfully attacked Margate and Dover.

"All our machines returned unharmed."

RUSSIA.

Official Communiqués.

Sept. 25th.—On September 22nd our aviators bombarded the enemy's stores in the region of the village Huta Borovenskaya (27 miles north-east of Kovel) and the small town Lubachevo, dropping about four poods (144 lb.) of bombs.

Sept. 26th.—Baltic Sea.—Since September 14th the enemy activity has become more intense, and has been chiefly characterised by aerial reconnaissances and submarine manœuvres, which are endeavouring to prevent our vessels approaching the Courland coast.

During the night of September 25th our coast of the Irben Channel was attacked by Zeppelins. During two raids nearly 40 bombs were dropped.

Sept. 27th.—On Sept. 25th the enemy made several aerial raids in the region of the Gulf of Riga, with the object of ascertaining the exact position of our naval forces. The enemy aeroplanes kept themselves beyond the reach of our naval guns and coast batteries.

Sept. 28th.—Our aviators dropped bombs on the Turkish camps to the west of Kalkit and on Kemon. In the last place explosions were observed.

Sept. 29th.—On Sept. 26th, in the Tarnapol region, our aviators brought down two enemy machines, which fell into the enemy lines. In the Husiatyn reigon our aviator Lieutenant Okennen brought down an enemy machine, which also fell into the enemy lines. In this region our aviators Ensigns Kirsanoff and Leman brought down an enemy machine, but in this combat the machine of Ensign Kirsanoff was damaged and fell into the enemy lines.

In the Focsani region the Rumanian aviator Lieutenant Dragetchano brought down an enemy machine whilst over the enemy lines.

Sept. 30th.—Near the village of Ohlenorovka, a German aeroplane was brought down by one of our "Muromets" machines. On the same front one of our aviators, Lieutenant Dobrukhotoff, brought down an enemy aeroplane, which fell in flames.

On September 23rd, in the region of Husiatyn (Russo-Galician Border) our pilot Ensign Iantchenko forced down an enemy aeroplane. In the same region our pilots Captain Kozakoff and non-commissioned officer Chirinski attacked four enemy aeroplanes. One of them was brought down by Chirinski, but the machine of the latter was in its turn damaged and put out of action. Captain Kozakoff continued the fight alone and forced the enemy to land in his own lines.

In the Baranovitchi region north of the railway, near the village of Polonetchka, an enemy aeroplane set on fire with burning liquid one of our captive balloons. The observer descended by means of a parachute.

In the region of the mouth of the Danube, north-east of the town of Kilia, an enemy aeroplane was captured. Its occupants—an officer and a private—were taken prisoners.

Oct. 1st.—On September 28, in the region of Kowel our aviators dropped on the enemy camps about 7 cwt. of bombs, and in the Buczacz region our giant aeroplanes of the Muromets type dropped about 2 cwt. of bombs. (!)

Supplementary reports establish the fact that N.C.O. Aviator Sapozhnikoff shot down an enemy machine in the village of Vollovetz, south-west of Radautz.

ITALY.

Official Communiqués

Sept. 25th.—During the day four tons of high-explosive bombs dropped by our aviators caused destruction and conflagrations in the railway establishments and stations of Podiberga (Podberdo) (Bazza Valley) and Rifemberga (Reifenberg) (Carso). In the night one of our airships surprised in the Chiapovano Valley (north-east of Gorizia) intense movements of troops and motor-lorry columns and dispersed them with a ton of projectiles.

Sept. 26th.—In the morning our aeroplanes bombarded the railway establishments of Podberdo (Bazza Valley), and in the afternoon those of Prosecco (coastal line). Altogether five tons of bombs were dropped, with results visibly effective.

Sept. 27th.—The railway plants at Grahovo (Bazza Valley, 20 miles north-east of Gorizia) and Dottogliano (Dutovlje, eight miles north-north-east of Trieste) were yesterday the object of attack on the part of our air squadrons, which dropped altogether five tons of bombs. The enemy reaction was very lively. One of our machines is missing. An enemy machine brought down in an aerial combat over Asiago fell in flames in our lines.

Sept. 28th.—Yesterday our aviators, persevering in the intention of interrupting the railway traffic in Bazza Valley (north of Gorizia), caused great destruction to the railway plant at Podberdo.

Last night one of our bombardment squadrons consisting of numerous machines, notwithstanding the heavy mist, reached the fortified maritime centre Pola and effectively bombarded the Arsenal and the submarine base at the Olivi Rock (the naval dockyards) with over three tons of high explosive shells.

On the evening of the 26th inst. enemy machines flew on the Lower Isonzo and bombed some inhabited centres without doing damage or causing casualties.

Sept. 29th.—Our air attacks were concentrated on the military zone of Voiscizza (Carso), which was effectively bombarded with about three tons of bombs, and on the fortified maritime centre of Pola, where the submarine base and the arsenal were again bombed with numerous projectiles by a strong bombardment squadron.

An enemy machine was forced to land in the plain of S. Lucia (Tolmino), where it was subsequently destroyed by our artillery. Last night hostile aircraft dropped incendiary bombs on the town of Palmanova; very slight damage and no casualties.

On Sept. 29th Serjt. Stoppani, on a Savoia Verduzio chaser aeroplane, flew from Turin to Rome, a distance of over 375 miles, in two hours and 50 minutes. The average speed was 137⅓ miles an hour. A strong wind was blowing.

Sept. 30th.—Air fighting was very brisk along the whole Julian Front. Our air squadrons yesterday bombarded the enemy depôts at Berje (north-east of Nabresina) (Gulf of Trieste) and last night the known military works of the fortress of Pola with excellent results. The reaction of the enemy was vigorous everywhere. One of our machines did not return to its base. Two enemy aeroplanes brought down in aerial combat fell in the neighbourhood of Montfalcone and east of Ternova.

Oct. 1st.—During the night of the 29-30 ult. hostile aircraft dropped bombs on Palmanova, Aquileja, Monfalcone, and other localities of the Lower Isonzo without doing material damage. One woman was killed.

* * *

On Sept. 26th Austrian seaplanes bombarded Grado, Gulf of Trieste, and killed several civilians, chiefly women, says an Exchange telegram from Rome.

TURKEY.

Official Communiqués.

Sept. 23rd.—In an aerial fight with two enemy aeroplanes, one of our machines put one enemy machine to flight and compelled the other to descend behind the enemy's lines.

Sept. 27th.—Tigris Front.—Two enemy aeroplanes which flew over our lines on the morning of September 24th were attacked by one of our aeroplanes piloted by Proby. Flt. Officer Reyner, who forced these two British machines to land in our lines. The pilots and observers of these machines—four unwounded British aviators—were made prisoners.

Sept. 28th.—On the 27th a cruiser, accompanied by a patrol vessel and a seaplane motor ship, appeared off the port of Beirut. While the cruiser bombarded the open town two seaplanes also dropped bombs on the town.

BELGIUM.

Official Communiqué.

Sept. 27th.—To-day our aviation service performed its duties as usual.

* * *

The military correspondent of the "Temps" on the British front writes on Sept. 26th:—

"The statements of captured German aviators are full of interest. The aerodrome at Ghistelles (south of Ostend) is now being disbanded because its personnel, which is bombarded incessantly day and night, will not remain there any longer."

DENMARK.

It was reported that Danish aeronautical circles have decided to co-operate in the regular Scandinavian aerial service, which will be instituted after the war.

SWEDEN.

A Nieuwediep motor-boat on Sept. 26th brought in a British seaplane adrift off the Dutch coast through lack of petrol. Its occupants were taken on board a guard vessel, pending internment decision.

HOLLAND.

A message from Amsterdam on September 26th states that two German seaplanes have been shelled down near Flushing by a Dutch torpedo-boat. The four aviators who manned them, including one injured, have been interned.

A Reuter message adds that one of the seaplanes was of a new type, and quotes the newspaper "Telegraaf" as reporting that whilst one of the seaplanes was shot down by a Dutch

torpedo-boat, the other had previously descended near Cadzand. The one which was shot down was flying very close to the torpedo-boat, and refused to surrender when summoned to do so. The torpedo-boat thereupon fired, wounding one of the occupants, both of whom then surrendered. The "Telegraaf" adds that about half a dozen German aeroplanes appear to have been flying over Dutch territory at the time.

The "Handelsblad" reports that a French seaplane, manned by an officer and a sailor, was brought into Nieuwediep on September 26th. The seaplane was forced to come down through lack of petrol off the Haaks Lightship, where it was picked up.

* * *

The two British aviators who were landed in Holland on Sept. 25th by a Dutch fishing vessel after they had been obliged to come down on the open sea have been set at liberty, but their machine has been seized by the Dutch authorities.

* * *

A telegram from Sluiskil states that on Sept. 29th a German aeroplane of the newest type, G.O.G.4 No. 602/16, descended near Sas van Gent. One of the three occupants was severely wounded. The machine was armed with three machine-guns, and had six bombs on board. The unwounded occupants attempted to escape to the frontier, but were caught. All three will be interned.

A telegram from Sas van Gent says that the aeroplane came from a raid on England. A map of Southern England, including London, and maps of Zeeland, Flanders, and the Belgian coast were also found in the aeroplane.

* * *

The "Telegraaf" learns from Zevenaar that a German aeroplane appeared on Sept. 27th over Doornenburg. It was fired on from a fort near Pannerden, and was obliged to descend, but it managed to go up again, and disappeared before it could be captured.

THE INVASIONS OF ENGLAND.

The Commissioner of Police draws attention to the new Lights Order which came into force on Monday. Its provisions are substantially the same as in previous orders, but the revised times, from which, until one hour before sunrise, blinds are to remain drawn, are given below:—

October 1st to 15th	6.30 p.m.
Oct. 16th to 31st	6.0 p.m.
November 1st to November 15th	5.30 p.m.
November 16th to January 31st	6.0 p.m.
February	6.30 p.m.
March	7.30 p.m.
April	8.30 p.m.

According to Greenwich mean time in each case.

* * *

A meeting of the Committee on War Damage was held at the Mansion House on Sept. 28th, the Lord Mayor in the chair.

The Lord Mayor reported that the Sub-Committee, consisting of himself, Lord Parmoor, and Mr. Mark Judge, had been in communication with Mr. Lloyd George's private secretary, but so far the Prime Minister had been too busy to deal further with the question of Government compensation for damage caused by air raids and bombardments.

A resolution was passed agreeing that the pronouncement made by Mr. Lloyd George on July 14th offered a satisfactory solution, and the Committee of three was requested to meet forthwith the body authorised by the Government, in order that a practical scheme might be formulated without delay.

* * *

The following is from the "Times" of Sept. 27th:—

The crowding of the Tubes long before the issue of any warning or any indication of attack, is also engaging the serious attention of the authorities. Great numbers of the alien population of the East-End, many men of military age, have taken to camping with their families three deep on the Tube platforms as early as 5 o'clock in the afternoon. Later arrivals are crowded to the edges, whence any movement, from panic or crowding would thrust them on to the live rail. Serious accidents of this kind were only avoided at certain stations in the Hampstead district by strenuous exertions on the part of the special constables. At some points, the campers refused to budge when informed that all was clear, and, crowding round the lifts and emergency staircases, delayed the egress of others for nearly an hour. Last night they were camped in large numbers on all the Tube stations from Charing Cross to Hampstead as early as 5.30, and at 7 o'clock there was scarcely room for passengers to pass to and from the trains. The majority of these people come from the East, where it is pointed out there is safe accommodation for 20 times the number of people who flock to the Tubes.

Complaint is made of the filthy condition and habits of these people and their migrations seriously threaten the health of the invaded districts. [Their germs are worse than the Germans. One also notices that many of the refugees fill up their time with "joy-rides" up and down the line to the discomfort and annoyance of bona-fide passengers.—Ed.]

* * *

A London Coroner held an inquest on Sept. 26th on the bodies of two men who were killed on Sept. 24th. The victims were Patrick Kennedy, aged 23, a native of Wooloomaloo, New South Wales, and Peter Ryan, 29, of Clifton, Bristol.

Inspector Arthur White, of the London Police, gave evidence of the warning being given, and said that ample opportunity was given to those in the streets to take cover. The dead men, with many others, remained in the street. The bomb fell outside an hotel, doing considerable damage. Twelve people were fatally injured.

The Coroner: "How many were injured?"—"About 18. The bomb fell about 12 ft. from the hotel entrance."

The Coroner: "Thirty people altogether—12 killed and 18 injured, all in the street. There's a useful lesson to be drawn from that." He added that as all the people who were killed or injured were in the street, it emphasised the necessity of taking cover or stopping indoors directly one heard gunfire. People who continued to walk about or stood in doorways or gazed up at the sky were seeking trouble. No one would deny admission to pedestrians at a time like this, and in this locality there were any number of hotels.

* * *

In view of the German admission that one of their aeroplanes had not returned from the raid of Sept. 25th it is interesting to note that a Gotha was reported to be so badly damaged by gunfire from an Essex district, as it was making its escape seawards, that petrol fell in large quantities over a wide area in the eastern part of a town. And this despite the fact that even water would disperse in a few hundred feet. German war petrol cannot be so unevaporable as all that.

WAR WORK FOR WOMEN.

A thousand women are wanted at once to train for engineering and other advanced forms of work in the munition factories.

The Training Section of the Ministry of Munitions is providing free instruction in machine work (general and more advanced), oxy-acetylene welding, aeroplane-woodwork, optical instrument work, draughtsmanship, electrical work, and core making.

Instructional workshops have been set up in London, Birmingham, Bristol, Luton, and Manchester, and other training centres have been established in twelve metropolitan areas and in twenty-four country districts, as well as in four centres in Scotland.

An appeal is made to women of good physique, and between the age of 18 and 35, to offer themselves at once for training. Such women are to be found in every class of society, and they are asked to apply to the Director, Training Section, Ministry of Munitions, 6, Whitehall Gardens, S.W.1.

THE LORD MAYOR'S LETTER.

Among the letters brought by Captain Laureati on his flight from Turin to London was one addressed to the Lord Mayor by Signor Agnelli, the managing director of the F.I.A.T. Company, of Turin, which said:—

"For the first time an Italian machine, built by the F.I.A.T., has flown from Italy to England, establishing, through the great highways of the sky, new ties to add to those which already on the fields of battle unite our two peoples in the holiest alliance. To you, my Lord Mayor—the first citizen of the great metropolis—ay arrive, over the peaks of the Alps and the valorous land of France, my respectful salutations and the most fervent wish for the victory of the brave soldiers of the Allies."

The Lord Mayor, in his reply, said he trusted that Captain Laureati's great flight might only be the forerunner of many simliar aerial enterprisee which might hasten victory.

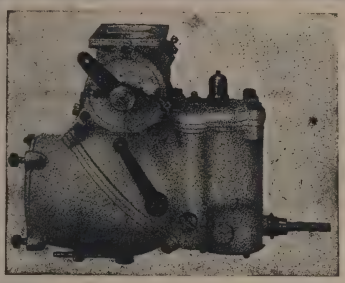
SIR GEORGE WHITE'S WILL.

Probate of the will of the late Sir George White, Bt., managing director of the British and Colonial Aeroplane Co., Ltd., has been granted to his son, Sir G. Stanley White.

The will provides for the division of all the unsettled property between the late baronet's son and daughter, Mrs. Ernest J. Hudson. Probate has been taken out on a gross sum, exclusive of the value of property settled or transferred in the lifetime of the late baronet, of £185,000, with net personality of £137,000.

PRESENTATION AEROPLANES.

The Secretary of State for the Colonies announces that the High Commissioner for South Africa reports the contribution of a further sum of £10,000 to war funds by the Paramount Chief and the Basuto nation.



His Majesty the King has expressed his high appreciation of this gift, which is being used for the purchase of aeroplanes.

MILITARY AERONAUTICS IN SWITZERLAND.

(The following article was published by the "Bulletin de l'Aéro-Club Suisse" as a reprint from the "Deutsche Luftfahrer Zeitung." It incidentally proves that nowadays even neutrals have to rely upon foreign publications for keeping posted on developments at home.—TRANSLATOR.)

Thus far, little information has reached the world regarding the organisation of Swiss military aeronautics. Of late, however, the Swiss General Staff's Press Bureau has published a memorandum dealing with the development of aeronautics in the belligerent countries, and referring also to the present status of aeronautics in Switzerland. Regarding the latter it says in part :—

"The war-born evolution of aircraft cannot but force us to greatly increase our aerial establishment if we want to remain efficient in this field, too. Here it is necessary to consider that, unlike the Great Powers, who can keep large aircraft factories working even in time of peace, Switzerland does not possess a real aircraft industry.

"Therefore, if we succeeded to build during the war aircraft of our own, it is chiefly due to the fact that our mobilisation recalled a number of engineers who were previously working in foreign countries. The construction of aero-engines, which is of a more exacting nature than that of ordinary petrol engines, has also been successfully undertaken; likewise, the training of pilots, which formerly was entirely dependent on foreign schools, is now satisfactorily done at home.

"Such is, then, briefly the development of national military aeronautics. If some think that the progress realised was not rapid enough, one should keep in mind the great technical difficulties and the corresponding expense of creating and developing this new arm. The Swiss people have—just like their neighbours—generously contributed to the national subscription for military aeronautics in order to enable the Army to increase their aerial establishment. But this purpose cannot be achieved if the military expenditure will not brace it in a marked degree, for there is still a long way before such degree of perfection can be attained, as is required by our military readiness."

This report permits to assume that the fund of the national subscription is nearly exhausted, as a consequence of which the Confederacy will undoubtedly authorise a considerable expenditure for military aviation. For it is generally understood that Switzerland does not intend to build airships, as their cost would be too great for so small a country. It is, however, proposed to enlarge the kite-balloon branch of the Army, since these craft have proven highly valuable in the great war as fire-control stations.

* * *

Thanks to the successful construction of national aeroplanes, the Swiss Flying Corps has now become a reality. Some time ago a squadron of 10 aeroplanes could be seen over Zurich, whither it had flown from the Confederate Air Station of Dübendorf. The first of a series of air bases (*points d'appui aérien*), which will be established in the near future, has now been created at Aarau, and Lt. Bider, the famous cross-Alps aviator, has been made the first Army Aviation Instructor. In order to prevent accidental violations of neutrality, Swiss aviators are under orders not to trespass the following zone :—Yverdon—Lake of Neufchâtel—Bienne (Biel)—Soleure (Solothurn)—Aar—Lägern—Rorbas—Winterthur—St. Gall—Reichenau—Tödi—St. Gotthard—Berne Alps—Rochers de Naye—Yverdon.

* * *

The war has influenced the situation of Swiss aviators in various ways. The Aero Club had certificated by October, 1916, 61 pilot-aviators; 12 of these lost their lives accidentally, and about as many gave up their profession before the war. Of the latter are Bianchi, Bucher, Gsell, Maffei, Salvioni, Schumacher, and Taddeoli. Nine aviators, namely, Audemars, Bider, Burri, Comte, Cuendet, Durafour, Grandjean, Lugrin, and Parmelin, offered their services to the Army, and are, though mobilised, kept on the reserve list. This enables them to look after their business; thus it was that Audemars broke the world's height record last year in France. Durafour is engaged at Buc, and Burri is with the Franco-British Aviation Cie.

Among the Swiss who are not Service-bound, Domenjoz is on an exhibition tour in South America. (He has lately gone to the United States.—TRANSLATOR.) Favre is chief-pilot of the Levasseur Works, and E. Baumann runs an aviation school at Hendon. The youngest Swiss aviator, the 19-year old Pasche, is testing, apparently with little success, an aeroplane of his own design, at Lavaux. Parmelin is in Geneva, and had to refuse advantageous offers from Russia and England, because the military authorities would not let him leave the country.

Among the Swiss aviators serving with the French *Aviation Militaire* Blancpain fell on the field of honour.

To his name should be added that of Sergeant Théophile Ingold, of Escadrille N. 23, who died of injuries received during a reconnaissance. He was recipient of a *citation à l'ordre de l'armée* and was proposed for the *Médaille militaire*; he was a cousin of Karl Ingold, serving with the German Flying Corps.—TRANSLATOR.

RESPONSIBILITY.

From the "Morning Post" of Sept. 20th :—

Sir,—I am an official working under the War Office, not under Munitions, but the gibes at "departmental tanglefoot" are being continually made at W.O. administration, and apparently produce no good result. They will not produce any result until the "causa causans" is removed.

And this cause—what is it? Money. How—waste? No; saving. The bed-rock trouble is the unwillingness of the people at the top to rely on the honesty of their subordinates. It is simply impossible for the senior Treasury official, whose concurrence would be necessary for any fundamental alteration in the methods of safeguarding the public purse, to give complete discretion to any lower official.

There is no parallel whatever to be found in what is called business—i.e., private enterprise as distinguished from Government service. The general manager of a railway company can, for example, allow a person to use a train in an emergency without paying for it. He is a trusted official, and whatever he did he would be backed up by his directors. Not so the public servant. Regulations are drawn up by the supreme authority, and practically no discretion at all is allowed to those who have to administer them.

It is no use girding at officials for being timid and being bound by red tape. I have a great deal of financial administrative work. My salary is £500 a year, and I am a married man. Do you think I am going to risk passing a claim of £3 or £4 when I know that if, on examination, it is found to come within the letter of the law I shall have to pay up that £3 or £4?

What I shall do is one of four things—either turn it down at once, or pass it to a subordinate to hunt up precedents, parallels, or previous decisions, or pass it to a colleague for his opinion, or pass it up to my superior for him to deal with.

If I turn it down, the claimant (and the public) call me stingy; if I follow either of the three other courses, the immediate consequence is delay, typing, writing, indexing, reading, talking, thinking, discussing, agreeing, disagreeing—in short, "bureaucratic incompetence." The cases that come up to me are the vexed ones, and it is precisely then that I should find more *power* so useful. But no; our theory of government is that I am not to be trusted.

A case occurred recently of a British serjeant travelling by train on duty in North China. For certain reasons it was impossible for him to travel third class, so he went first. The Regulations only allow a serjeant to travel third. All the power in the hands of our General Officer Commanding the China station was unavailing to sanction this extra expenditure. None but the Lords Commissioners of the Treasury were competent to do so.—Yours, etc.,

CALAMUS.

Sept. 19th.

A LESSON WANTED.

It might be well if someone of superior rank and intellect would give a few lessons in flying to the young gentlemen in the R.F.C. who visited Henley on a mono-avro on Sunday last about 12.30 p.m. He should at least be taught to handle his engine properly before he is let out alone. He first appeared as a sound only, fairly high up, then after a silence of several minutes he appeared at something like 1,000 feet, making frantic efforts to get his engine to start. Fortunately for him, it picked up at about 300 feet, and by the time he was down to 200 or so it was firing properly again. Having found his engine he proceeded to fly up the river from Henley to Marsh Lock, just level with the tops of the trees, and well away from any possible landing-place in case of engine failure. Thereafter he proceeded to do some rather crude turns over the town, finally landed on the golf course, and went to the Red Lion for lunch. His exhibition was not in the least pretty to watch, as his flying was quite of an elementary nature. All he did, in fact, was to endanger the King's property by flying absurdly low, and to annoy sundry perfectly peaceful persons with his antics.

C. G. G.

ROYAL FLYING CORPS CASUALTIES.

Under the title "Royal Flying Corps" a handbook has been compiled by Captain G. L. Campbell, R.F.A., T.F. Res. of Officers, assisted by Mr. R. H. Blinkhorn, which contains in tabular form the casualties and honours won by the R.F.C. during the period of the war brought up to July, 1917.

In the preface the compiler points out that many mistakes and omissions occur, and invites anyone who notices anything wrong therein to communicate with him at the publishers.

The paper cover edition costs 1s. 6d., and a cloth cover edition 3s. The book is published by the Picture Advertising Co., Ltd., and can be obtained from the Wm. Dawson Publishing Co., Ltd., Rolls House, Breams Buildings, E.C.4. Threepence extra per copy should be added to mail orders for postage.

Aeroplane Construction

In aeroplane construction the vital factor is "how many machines can be turned out in a given time." This depends entirely upon the efficiency of the machinery employed. And no machine reaches its highest point of production until its clutches, brakes, etc, are fitted with Ferodo Fabric.

Ferodo Fabrics are the most efficient transmitters of energy. Leather, wood, textile beltings, etc., are out of date for Friction drives and Braking purposes. The moment they become soaked with oil they are useless; Ferodo Fabrics never slip, never seize; are not affected by water, oil or acid, and are absolutely reliable under all conditions.

AN EXHIBITION OF WAR WORK.

An important official exhibition was opened on Wednesday, Sept. 26th, at the Mappin Art Gallery, Sheffield, where samples of women's work, in connection with munition making, together with photographs of the different processes, are on view.

The exhibition is under the ægis of the Labour Supply Department of the Ministry of Munitions, and, as three sections are devoted to aircraft work, those interested in the manufacture of aeroplanes, engines and their parts, in the Sheffield district, are strongly recommended to pay a visit.

In the engine section are photographs and specimens illustrating the various operations entailed in the manufacture of parts of Clerget, R.A.F., Beardmore, Gnôme, and le Rhône engines, details being given of the nature of the tool or tools employed, the limits of tolerance allowed, the time taken to perform the operations, and the manner of setting up the tools.

In a similar way, sections of the exhibition are devoted to aircraft fittings (metal), and to aircraft woodwork, and samples are shown both of tinclips and wood members, many of which are made completely by women, and under female supervision.

The exhibition will be open until October 9th, and it is hoped that it will be well attended, not only by woman munition workers and prospective workers, but by the employers of labour who are still sceptical as to delegating important and accurate work to woman workers.

RED CROSS AEROPLANES.

Mr. A. J. Greenwall, writing in the "Daily Express" from Paris on Sept. 27th, says:—

Dr. Chassaing, who represents Puy-de-Dôme in the Chamber of Deputies, interviewed by 'Exclesior,' says that in most cases the quickness of first-aid is a question of life or death to the wounded. "Men who are wounded in the abdomen must be attended to at once, and no matter how perfect the sanitary organisation may be, it cannot overcome the congestion of the roads, which sometimes means that the ambulance wagons have to wait hours before they can leave the front lines.

"In the air there are no obstacles. Therefore, I have adapted an army type of aeroplane. I had two stretchers installed, and the results of the first trial, which took place at the Villacoublay aerodrome last week, exceeded my expectations. I occupied one stretcher and a soldier occupied the other. We flew about 15½ miles in 12 minutes, which represents a speed of about 80 miles an hour, and during the flight we did not feel the slightest inconvenience; the equilibrium of the aeroplane was perfect."

Dr. Chassaing believes that many thousands of lives may be saved by aerial transportation, and he suggests that the machines shall have red crosses painted on the wings and fly at a low altitude.

[This was a favourite idea of the late Mr. S. F. Cody.—Ed.]

"THE AEROPLANE SPEAKS."

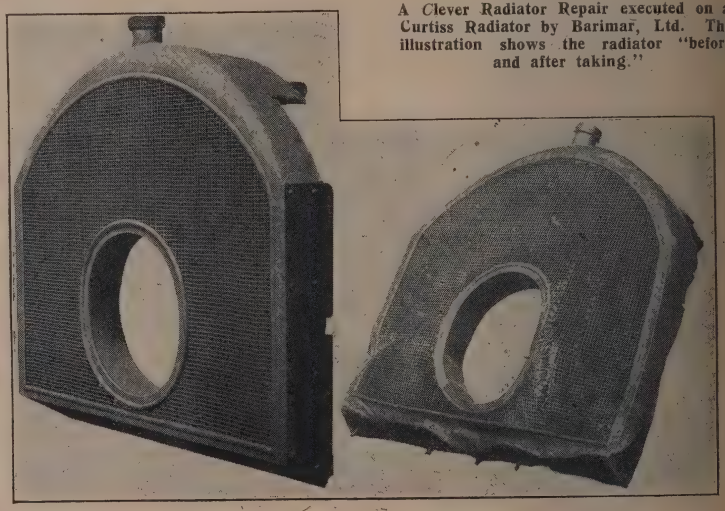
The fourth edition of that invaluable work, "The Aeroplane Speaks," is now on sale, and its author, Captain H. Barber, R.F.C., is heartily to be congratulated upon a book so popular as to attain its fourth edition in little more than half a year.

For the benefit of those who have not had an opportunity of reading earlier reviews, it may be pointed out that "The Aeroplane Speaks" presents the whole theory and practice of flying in an entirely new manner, which may readily be understood by the layman, but in which the accomplished pilot will also find charm.

Industrial conditions may make it impossible to produce a further edition during the period of the war, and readers are, therefore, recommended to order copies early.

Copies may be obtained from the Wm. Dawson Publishing Co., Ltd., Rolls House, Breams Buildings, E.C.4. Price, 7s. 3d., post free.

THE OVERSEAS CLUB.



In less than six months the Over-Seas Club has collected more than £13,000 for the two Royal Flying Corps hospitals which have recently been opened—one in Eaton Square and one in Bryanston Square. The members have already contributed just on £500,000 for war purposes.

In a letter of thanks Sir David Henderson, Commanding the Royal Flying Corps, writes:—

"The Over-Seas Club has a strong link with the R.F.C., as we have already to thank its members for the presentation of over 100 aeroplanes; while, as you know, nearly 1,000 Britons from over-seas hold commissions in the Corps. In the near future we hope to open an up-to-date convalescent home, if possible by the sea, where our officers will be able to regain strength under ideal conditions. I hope, therefore, that we may count on your continued help. I cannot close this letter without a few words of special appreciation of your little monthly magazine, 'Overseas,' which has been so largely instrumental in making the appeal so successful."

A BARIMAR REPAIR.

One of the outstanding features of the war has been the extraordinary degree of perfection to which surgery of all kinds has been brought; and not the least interesting branch has been the repair of all kinds of mechanical appliances which would in ordinary times be consigned to the scrap heap. The illustrations show two views of a Curtiss aeroplane radiator before and after it has been treated by the Barimar Company's expert radiator repair. In the words of Mr. Brett, the managing director of the firm, that "not even the historic Sam Weller's double-million magnifying glasses" would enable the reader to discover in the larger illustration the spots where the original injuries were received.

A Clever Radiator Repair executed on a Curtiss Radiator by Barimar, Ltd. The illustration shows the radiator "before and after taking."

The Barimar firm are still able to undertake a certain amount of private work for persons concerned with occupations of national importance, and defective engine parts of all kinds should be sent to Barimar, Ltd., 10, Poland Street, Oxford Street, W.1, where similar treatment will be given to them.

A REPUDIATION.

The Whitehead Aircraft Co. have asked that no further publicity be given to an absurd paragraph which appeared in the "Daily Sketch" and the "Evening Standard" apropos a proposal to build a machine to fly the Atlantic next year. The paragraph was entirely unauthorised by the Whitehead Co., and the alleged facts were apparently communicated to the Press by an employee of the firm in the desire to obtain publicity.

ON GETTING OUR OWN BACK.

This past week may reasonably go down to history as "Reprisals Week." Everybody has been speechifying and writing and talking and shouting about reprisals. Personally I am all against agitation for reprisals, simply because it makes us look so ridiculous to be shouting for reprisals, when what has really happened is simply that the Germans have developed a special branch of warfare which we have neglected in a manner which can only be described as idiotic.

If I am not very much mistaken, the first bombs dropped on enemy territory in this war were dropped by R.N.A.S. pilots at Düsseldorf and Cologne, and after that at Friederichshafen, so we can, at any rate, claim that some of our people had the sense to see that bomb-dropping was worth while. One of our futile little bombs actually blew up a brand-new Zeppelin and its shed. Afterwards another airship shed and its contents were destroyed in Belgium, and two other Zeppelins were destroyed in the air by R.N.A.S. bombs from aeroplanes. And yet we never really took bomb-dropping seriously.

At first bombing was regarded rather as a kind of sport for young and energetic aviators, after the serious work of the day was done, or on an off day when the particular aviator was not down for reconnaissance or anything that mattered. Later on the bombing of railway and munition dumps in Hunland—which is Allied territory occupied by the enemy, as distinct from Germany proper—was tackled more or less seriously, but very unscientifically, for any old machines were used for the job, bombs were stuck outside them in the crudest of bomb-release gears, guaranteed to carry the minimum of bombs with the maximum of head resistance. And yet we had before us all the while that beautifully neat revolving bomb-carrier, built into the fuselage of the machine, designed by M. Coanda, of the Bristol Company, and exhibited at the Paris Aero Show of 1913.

Until quite recently, it was never worth the while of any designer to design a machine specially for bombing, because the authorities did not want it, in spite of the fact that we built the first specially designed bomber—as mentioned—and although the first little R.N.A.S. raids were successful. We even went to the trouble of sending a special bombing wing of the R.N.A.S. to Eastern France last year, equipped with machines "faked" for bombing, instead of designed for that job and no other. (Some day, after war, I hope to write the history of the wing.) And yet we are surprised when the German goes to the trouble of building as good a bombing machine as he knows how, and proceeds to use it for the purpose for which it was built.

M.Ps. and Generals and all sorts of people start agitating for reprisals when what they ought to do is ask those who have been responsible for the Flying Services in the past to explain why they have neglected their opportunities. Bomb Germany by all means, but let us bomb it in a proper spirit. The very word reprisal is enough to make one sick. A reprisal implies an act of righteous vengeance for wrong-doing, whereas what we want is to get our own back on the Germans because they had sense enough to hit us really hard before we had the sense to hit them. All our efforts hitherto have been merely enough to indicate to them how to begin to set about the job themselves.

The Solution of a Puzzle.

A good many people have been puzzled as to why the raids at the end of September were made so early in the evening, when in the ordinary course of events one would have expected them about midnight or after, so as to annoy people who have gone to bed. The reason cannot have been that the Hun, in a fit of generosity, desired to have the firing over in good time, so that people in London could get to bed at a reasonable hour. Nor can it have been altogether because the O.C. Hun Flying Corps in Flanders wanted himself to see his raiders return and did not want them to be kept up late—unless he is very different from British C.Os. of bombing squadrons in this respect.

When one comes to think it out, the reason is, after all, fairly simple. The Hun is, at any rate, a painstaking and scientific beast, and he has probably worked it out carefully that at this time of the year, on a calm night after a hot day, most of England is under a thick blanket of white mist. Therefore, if his raiders are to see their way and get a sight of their objectives, they must arrive early before the mist rises.

After midnight the mist becomes really thick, especially along the Thames Valley, and by the early morning it amounts to a fog, which, with the moon shining on top of it, would simply present a white sea to the raiders. Therefore it is essential that the raiders should arrive early in the evening. If anyone can think of a better reason, it would be interesting to hear it.

Incidentally one almost regrets the increase in consumption of gas for heating and the introduction of improved combustion fire-grates during the past thirty years or so, for the atmospheric condition of those recent raid nights would have been ideal for the production of a real pea-soup fog, which would have hidden London completely.

Thanks.

One may perhaps make use of this opportunity to point out the excellence of the work done by the organisers of the defences of London. It is obvious that one or two aeroplanes may come unscathed through an aerial barrage, just as a number of men will get through an artillery barrage on the ground, but where quantities are concerned the position is very different. The barrage now put up by the London "Archies" shows that capable heads have taken charge, and anything

like a real raiding fleet would certainly have a very unpleasant time.

However, the effectiveness of purely home defence arrangements certainly does not detract from the advisability of carrying on an offensive-defensive against the German aerodromes in Flanders, where London defence really begins. After all, the cost of the shells in any one raid night by all the guns between the coast and London in various directions would pay for a good few aeroplanes to hunt the Hun in Flanders.

Also, those who are crying out so loudly for *immediate* raids on German towns might well consider whether it is not wiser first of all to achieve a definite effect and stop the raids on London by smashing all the German aerodromes in Flanders, before flying over those same aerodromes without touching them for the sake of doing moral and intellectual damage in Germany itself.

Those who remember a certain "Open Letter to the Air Board" in this paper some months ago will recall the various benefits therein set forth as bound to follow a really big aerial offensive on Germany, and to-day the value of such an offensive would be greater than ever, in that recent set-backs to the German Army in Flanders make any attack behind them of increased value, both because it will weaken the Army, and because it will have greater effect on the weakened *moral* of the people.

One at a Time.

Nevertheless, it is generally well to do one job properly first, and such bombing machines as are at first available may do better work on the aerodromes in Belgium. As General Smuts admitted, we should have started bombing Germany sooner if we had had enough machines to spare for the job. It would be a fatal error to neglect our opportunities in Belgium and to start bombing Germany with two or three machines at a time as they become available, and so just provide useful practice for the defences, without doing serious damage.

And apropos bombing aerodromes in Belgium, let it be here put on record that no praise can be too high for the able young officers of the R.N.A.S., who, despite all sorts of hindrances and obstructions, have built up not merely the nucleus of a real bombing fleet, but have evolved a science of bomb-raiding with its own strategy and tactics. Some day, perhaps, it may be possible to publish the real history of the bombing squadrons in Flanders. An interesting and surprising history it is—and yet not very surprising when one knows the people who obstructed, or failed to assist, progress when they had the opportunity not merely of serving their country, but of making history, and of winning undying fame for themselves as the founders of our offensive and defensive air fleets of the future.

However, when those squadrons have done their job as the advanced posts of the London defences, we can begin to think about hitting Germany really hard.

Our Geographical Advantage.

It does not seem to have occurred to many people that, despite the abolition of the Channel and the North Sea as a barrier against invasion, we in this country have an immense geographical advantage.

Imprimis, let it be assumed that the extreme range for bombing aeroplanes at present, and for some months to come, is somewhere in the region of 200 miles, that is to say, 400 miles in all, out and home in a straight line, with perhaps another 50 miles thrown in for divergences from the true course to avoid barrages and pursuing enemy machines. This is true to-day, despite Swedish rumours of 1,000 h.p. Gothas, capable of flying for 10 hours, as reported under the German Notes in this issue, but it is well that we should prepare for the advent of such machines in the future.

Many machines, in fact any respectable bombing machine, could fly for 800 or 1,000 miles, but it would have to carry all petrol and no bombs, and one may put a round trip of 450 miles as about the present limit with enough bombs to make the journey worth while.

Now it so happens that if you take any aerodrome in Belgium as a centre and draw from it an arc of a 200-mile circle across England, London is the only city, or even town, of importance within that circle. Harwich comes in, but that is a Naval port, anyhow, and so is Dover. Hastings, Eastbourne, and Brighton also come in, but they are only holiday resorts, and if they were bombed to bits it would not influence the mass of the population in the least, and probably a goodly number of undesirable aliens would be mercifully removed.

Even if London itself were made uninhabitable, it would not seriously affect England as a whole, and such a result is scarcely likely to happen, seeing that London can be adequately defended, by going to some little expense. Therefore, it is not likely to make any very serious difference to this country whether Germany goes on invading with a dozen aeroplanes at a time, as hitherto, or starts in with a couple of hundred. Also, even if Germany produced machines capable of doing an extra 200 miles, the industrial centres in the Midlands are by no means easy to find in the dark, none of them being on a tell-tale river.

Germany's Position.

Germany's position is, however, entirely different. The bulk of her important manufacturing centres are well within the 200-mile radius of Dunkirk, and even nearer to Arras—as the "Morning Post's" map pointed out. And very many of them are either on or close to the Rhine, a landmark which is easily picked up on the darkest night, provided there is no fog.

Now, a mere 500 machines—provided they are real big bombers, and not just "Christmas Trees," with bombs hung on as decorations—would do quite considerable damage if let loose all at once in batches of 50 on ten of those cities. The actual material damage would certainly be large, and the moral effect on a purely industrial population would be larger still. The result would be an immediate decrease in the output of munitions and an immediate increase in "peace talk."

The German people have been brought up to believe in the impregnable defence of the German Army. If they can be shown that the Army cannot defend them, they will receive the best possible lesson on the beauties of peace.

A Too Subtle Reason.

It has been suggested that the raids on London have been made with the express intention of forcing us to retaliate, with the idea that a few good raids on Germany would stir up the inhabitants of the industrial cities to resist strongly all aggression, and would thus create a powerful determination to fight to a finish—in fact, that our raids would pull the German people together, put democratic ideas out of their heads, and induce them to stick it out to the bitter end. The notion is ingenious but not convincing.

Apart from the Prussians the German peoples are docile and subservient to their masters, otherwise the Prussians would not have been able to dragoon whole kingdoms of them into obeying the will of Potsdam. Any merchant skipper will bear witness that the "square-head" German seaman is easier to bully than any other of the Pentecostal crew which he has been in the habit of bossing. Therefore, the Prussian High Command has made the psychological mistake of thinking that the English people can be as easily bullied into obedience. Hence the air raids.

The other reasons for the raids are, the perfectly good

intention to hang up our production of munitions—as Sir George Cave stated some months ago—and the equally good intention of forcing us to keep men and guns and aeroplanes for defence purposes on this side of the Channel, thus depleting our forces in France—in both of which intentions the enemy has had some limited success. The obvious way to put a stop to such successes is to retaliate, and to retaliate on a big scale.

Honesty the Best Policy.

The great thing is to do it properly. Let us get away from the cant of reprisals. Nothing can be more derogatory to our dignity as a nation than the semi-official notice issued last week, which read thus :—

"On the highest authority Reuter's Agency states that in consequence of the continued policy of Germany wantonly to attack open and unfortified places, and to cause death and destruction to the civilian population and civilian property, His Majesty's Government, after the most careful consideration, has decided to adopt air reprisals against Germany."

One prefers to believe the other semi-official notice, issued on Oct. 4th, thusly :—

The Central News learns from a highly-placed authority that the question of reprisals was yesterday seriously occupying the attention of both the Prime Minister and General Smuts, both of whom are, it is understood, strongly in favour of bombing the Rhine towns.

Our difficulty in the past has been that we have not had a sufficiency of aeroplanes to carry out reprisals on an extensive scale (said the authority). It is obviously of no use sending one or two machines to drop a few bombs. When we send our aeroplanes over the Rhine, they will have to go in very large numbers, for the bombing will have to be effective and attain far greater results in a single raid than those which the Germans have attained here in a number of raids.

At the moment all our machines are needed for military work, such as the bombing of hangars and hutments, and the essential work on the front. We have certain very definite objectives to attain before the winter sets in, and if these objectives are to be attained we cannot afford to release aeroplanes, at the moment, for the bombing of open towns. But the output of powerful machines has been greatly accelerated, and we shall before long be in a position to send them over to Germany.

The idea that the enemy possesses better and more powerful machines than we do is a totally erroneous one. Germany is doing nothing like the work on the front with her machines that we are doing with better and more powerful machines. When the time comes we can bomb German towns, and we shall bomb them heavily.

The Points of the Argument.

The chief point of that notice is that we have not had enough aeroplanes in the past, or, presumably, we should have hit Germany first. Someone is to blame for that lack of machines, about which this paper has been agitating for years, though the London Press has apparently only just discovered the lack.

The second interesting point is that "the output of powerful machines has been greatly accelerated." That output must be accelerated still further, and the people who can best do the accelerating are the workpeople engaged in building the machines. It is up to the workpeople of England to save themselves and their friends from being bombed.

The third interesting point is that we shall bomb German towns heavily when the time comes. The arrival of that time, like the acceleration of output, depends on the workpeople who are building the big bombing machines—which, presumably, is why some of them went out on strike recently.

Anyhow, it is now pretty clear that the chief protection of the British workman and his family against

GONTRODE AERODROME.—Photographed on Oct 1st after sundry raids. Bomb craters may be seen in the fields in the aerodrome itself, and the points where other bombs fell are indicated by arrows on the left. A number of aeroplanes may be observed near the big airship shed. The big quadrilateral figure in front of the shed is apparently the rolled-out landing and starting straights.

enemy air raids is the British workman himself, and managers may well impress that fact on their hands.

A Clear Course.

The course is now clear for a straight race with Germany for the mastery in the air. We have greater resources than Germany if we can use those resources. So far as the people at the top are concerned all is well. The political heads of the Empire are at last resolved to attack Germany thoroughly by air.

If we are to have an Air Ministry, as so many people believe, then, obviously, the first Air Minister should be Mr. Winston Spencer Churchill, whose splendid work at the Ministry of Munitions has confounded his critics, and has confirmed the high opinions which he won at the Home Office and at the Admiralty, and by his work in forming the R.N.A.S. against all opposition. He, at any rate, would have no hypocritical objections to bombing Germany. That is if he can leave Munitions.

The people who are officially responsible for the output of machines are equally resolved to get maximum quantities at all costs, and are going the right way to work to get them.

The people who are responsible for the technical design of the machines to be used are just as resolved to have the best quality of aeroplanes and engines for the job, and they are not likely to make many mistakes.

On Whom the Responsibility?

But the people at the top cannot get results unless those below are absolutely loyal. In that great and grimly humorous book, "The Secret Agent," Mr. Joseph Conrad sums up the situation with his usual skill in psychology. The Assistant Commissioner of Police, studying the case round which the book is written, becomes suspicious that the Chief Inspector of the Special Crimes Department is "up to something" on his own account, and reflects, "Here I am stuck in a litter of papers, supposed to hold all the threads in my hands, and yet I can but hold what is put in my hand, and nothing else. And they can fasten the other ends of the threads where they please."

There you have the whole philosophy of a Government Department. The chief may be the cleverest man in the world, and yet if his subordinates do not fasten the other ends of the threads in the right places, he must be a failure. Which is why a man of mediocre mind with a Heaven-sent gift for delegating duties to trustworthy subordinates is so often a greater success than a really brilliant man who is cursed with a faculty for backing the wrong horse, where the choice of assistants and their subordinates is concerned. We have had some notable examples of the latter type.

However, the moral of this sermon is that if Germany is to be bombed into her senses, and if real military damage is to be done at the same time, the responsibility for providing the machines and for bringing close the start of the invasion of Germany now rests not on the chiefs of departments, but on the subordinate officials, and on the workpeople in the factories.

The date on which the great invasion begins depends on Acting-Deputy-Sub-Assistant-Directors and their clerks in the Hotel Cecil, on A.I.D. inspectors and examiners and viewers in aeroplane and engine factories and on foremen, charge hands, and workmen—and women—in those factories. They, and they alone, can advance, or delay, the day when we shall get our own back on Germany.—C. G. G.

ST. DENIS WESTREM AERODROME.—Photographed on Sept. 30th. Various bomb craters may be seen in the aerodrome, and several sheds have been destroyed. The herring-bone white lines near the sheds appear to be recently made drains in a wet patch. The big black lines have been drawn on the photograph to indicate the bombed area.

THE REORGANISATION OF THE GERMAN FLYING CORPS.

THE 1916-17 PROGRAMME.

BY "AUSTERLITZ."

The Allied offensive of the Somme, in July, 1916, proved beyond doubt the overwhelming superiority of the Royal Flying Corps and of the French *Aviation Militaire* over the aerial forces of the enemy. During the preliminary stages of that battle a powerful aeroplane barrage of the Allies effectually prevented enemy aviators from crossing our lines to discover our preparations; in addition to this strategical blinding, the enemy's artillery was also deprived of its *eyes*, all of its kite-balloons being either destroyed or driven down by Allied aviators. German army orders, found on officers taken prisoner, acknowledged with great frankness the inferiority of their air service, and directly ascribed to it the costly defeat the enemy suffered.

Since then, however, the enemy has furnished a very considerable effort, with a view of re-establishing the aerial situation in his favour, and this effort, pragmatised by an ambitious building programme, eventually resulted in a complete reorganisation of the German Flying Corps.

This reorganisation, which now appears to be completed, affected both the tactical formation and the *matériel*. There are at present four major tactical formations within the German Flying Corps; these are:—

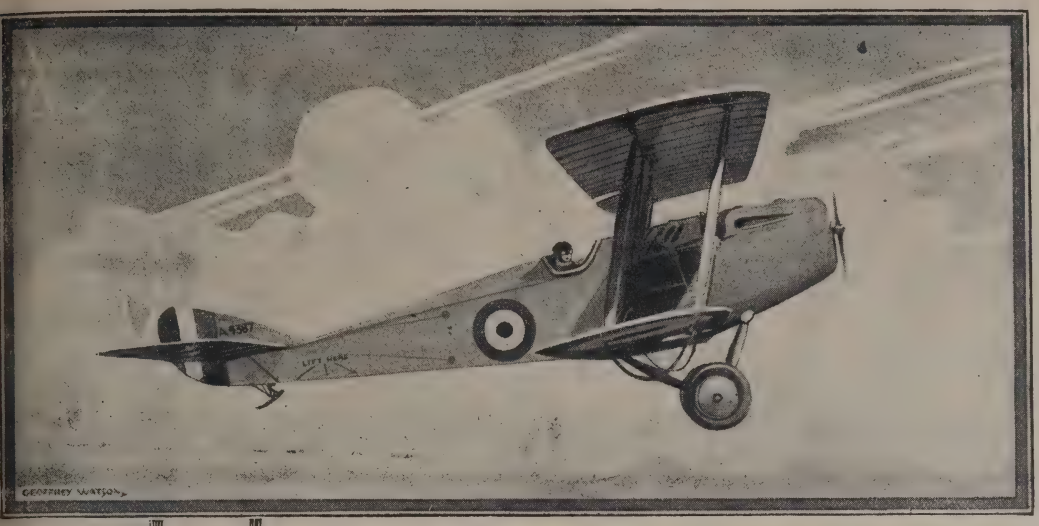
(1) Army squadrons (Armeeflieger-Abteilung).
(2) Army corps squadrons (Truppenflieger-Abteilung).
(3) Pursuit squadrons (Jagd-Staffeln).
(4) Battle wings (Kampf-Geschwader).

1. The *Army squadrons* are placed under the direct orders of the O.C. the aviation service of each army; they are primarily employed for strategical reconnaissances, but may sometimes be detailed on photographic work and even bombardments.

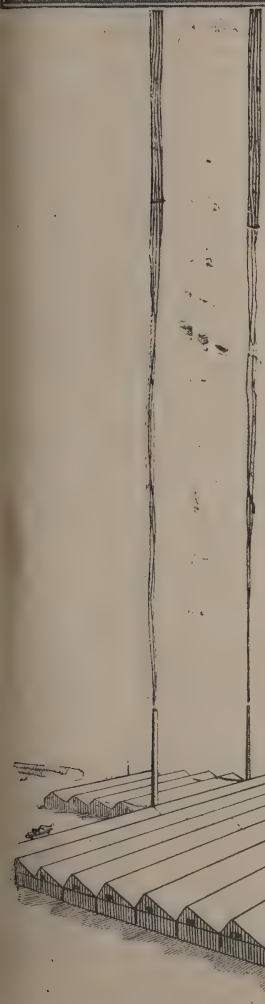
The *machines* forming the Army squadrons all belong to a standard model in which only minor details may vary, as a certain latitude is given the contractors in this respect. The machines are two-seater tractor biplanes of from 41 to 45 feet span, and are fitted with a stationary Benz or Mercédès engine developing from 22 to 240 horse-power. Their horizontal speed is from 10 to 105 miles per hour.

The *armament* consists of (1) two machine guns, on of which is mounted on a fixed emplacement in front o the pilot, and fires through the propeller by means o a synchronising device; the other machine gun i mounted *en barbette*, aft of the pilot, on the observer' seat; (2) one or two bomb gears, munitioned with fou or six bombs.

The firms building this type are the L.V.G., th D.F.W., the Aviatik, and the Albatros. The latter firm has, however, recently produced a more powerful mode which is fitted with a 260-h.p. Mercédès engine, an develops a horizontal speed of 115 miles per hour. Th climbing speed is said to be 6,600 feet in 9 minutes fully loaded. It is confidently expected that eventuall all the machines of the Army squadron type will b fitted with the new 6-cylinder, 260-hp. Mercédès engin which is, though but slightly heavier, much more re liable than the 8-cylinder, 240-h.p. model. As th engine base of both models has the same width, onl slight alterations would be necessary to fit the abov described type of machine with the 260-h.p. mode although the wing area would probably have to be some what increased. It is worth noting that in 1916 th standard 150-h.p. two-seater tractor biplane was sim larly modernised when it was fitted with the 175-h.p Mercédès.



2. The *army-corps squadrons* are assigned to ind vidual army corps, and are, as a rule, commanded by captain who is placed directly under orders of the secon bureau of the army corps staff. Their chief function tactical reconnaissance, photography, gun spotting, an during active operations, contact patrol work betwee the units engaged in an advance.



The army-corps squadrons are equipped with machine which are in every way similar to those forming th

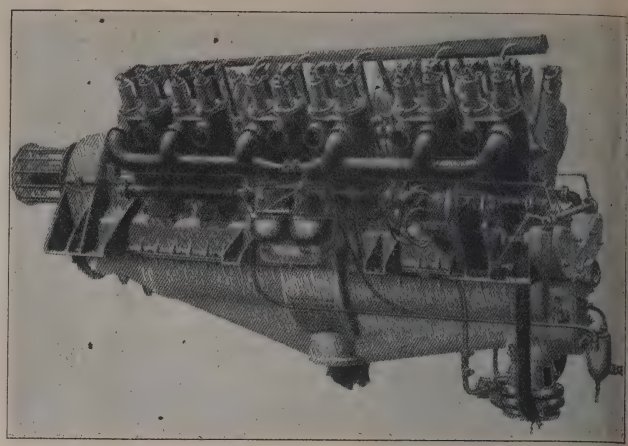
S.B.A.C. THE SOCIETY OF BRITISH AIRCRAFT CONSTRUCTORS

KINDLY MENTION "THE AEROPLANE" WHEN CORRESPONDING WITH ADVERTISERS.

army squadrons, except for a smaller power plant which endows them with lesser speed. Such are, at present, the two-seater tractor biplanes built by A.E.G., Albatros, Aviatik, L.V.G., and Rumpler, which have a span of from 39 to 43 feet, and are fitted with a 6-cylinder, 175-h.p. Mercédès engine. The horizontal speed is from 90 to 95 m.p.h.

The armament is the same as on the army squadron type. Provision is made on these machines for the quick exchange of the bomb gear against a radio installation or a photographic apparatus.

3. The *pursuit squadrons* are assigned to individual armies in numbers varying in accordance with needs. Although their principal function is the defence of the army corps squadrons engaged in tactical reconnaissance work, they are also employed, in some instances, on convoy duty with bombers and for the destruction of Allied kite-balloons.



There appear to be, at present, on the Western front, about 40 pursuit squadrons, each of which consists of 12 machines. In some instances two or more squadrons are combined into pursuit wings which are placed under the leadership of particularly capable chiefs; these units are not permanently assigned to particular sectors, but are entrusted with special missions according to needs. Such are the now celebrated "travelling circuses" of Von Bülow and Von Richthofen. These special wings generally scour the Western front for Allied machines travelling up and down the line from Nieuport to Belfort.

A number of pursuit squadrons are detached to the local defence of important German towns, in particular at Metz, Strasbourg, Mulhouse, Friedrichshafen, Stuttgart, Essen, Cologne, and Trèves.

The pursuit squadrons are equipped with one-seater biplanes of from 28 to 30 feet span which are fitted with a 175-h.p. Mercédès engine driving a tractor screw. The horizontal speed of these machines is from 110 to 125 miles per hour; they are principally built by Albatros, Fokker, L.T.G. (Lufttorpedo-Gesellschaft), and Roland.

The armament consists of two Spandau machine guns, mounted "fixé" in front of the pilot, which are synchronised to fire either simultaneously or alternately through the propeller. No bomb gear is provided.

The older pursuit machines, such as the Halberstadt, with a 120-h.p. Argus engine, the Rex, with a rotary 100-h.p. Rex engine, and the Fokker, with a 100-h.p. rotary Oberursel (German Gnôme), all of which are tractor biplanes, appear to be employed, at present, chiefly on the "easier" Eastern front.

A recent type of Körting Engine showing distinct signs of English influence. Sundry Sunbeam and Rolls-Royce points seem to have affected the German designers.

How long the 175-h.p. Mercédès pursuit machine will remain in commission on the Western front is already open to speculation, for it is known that the Teutonised Dutchman Fokker is experimenting with a pursuit machine fitted with a 260-h.p. Mercédès engine, with which he expects to break all speed and climb records.

4. The *battle wings* are placed under the direct orders of General Headquarters, and are not, as a rule, permanently assigned to particular sectors.

These wings consist of from 40 to 50 machines, and are subdivided into four or five squadrons. The machines are mostly Gotha twin-pusher biplanes, which have a span of 78 feet, and are fitted with two 260-h.p. Mercédès engines. (A detailed description of these machines appeared in The Aeroplane of July 18th, 1917.) A certain number of bomber squadrons are, however, equipped with A.E.G. twin-tractor biplanes and a huge Rumpler bomber will shortly be placed in commission, unless it is already in service. The Germans have no mean hopes of this machine, particularly as regards speed and climb.

There are, at present, three battle wings in commission. Wings No. 1 and No. 2 are mobile formations, each of which disposes of a special railway train for the transport of the *matériel* and the *personnel*. These wings are assigned by General Headquarters, from time to time, to such sectors as may require the co-operation of a powerful bombing unit.

Wing No. 3 is stationed in Belgium, and appears to be chiefly entrusted with expeditions against Great Britain. This wing consists of Squadrons No. 13, 14, 15, 16, and 17, all of which are equipped with Gotha bombers.

AN INTERESTING ALLIANCE.

Those who were concerned with the early days of aviation will be interested to learn that Lieut.-Col. Mervyn O'Gorman, C.B. (T.F.Res.), late Superintendent Royal Aircraft Factory, has joined the forces of Mr. G. Holt Thomas, and has accepted a responsible post on the staff of the Aircraft Manufacturing Co., Ltd. Owing to his official positions in the past, Colonel O'Gorman has not been a familiar figure among people in the Aircraft Industry, and is, in fact, better known personally in the Motor Trade, with which he was connected before being absorbed into Government employment.

Nevertheless, those who had the privilege of hearing or reading the Wilbur Wright Lecture delivered by him to the Aeronautical Society recently will have recognised in him a mentality and a personality of no ordinary kind. The foresight and the ability to envisage the possibilities of aircraft, as demonstrated in that lecture, show the great potentialities of Colonel O'Gorman as concerns aviation after the war, and undoubtedly his mental gifts in alliance with the organising power and business acumen of Mr. Holt Thomas will strengthen considerably the already important position of the Aircraft Mfg. Co., Ltd.

Apart from his mental brilliance, Colonel O'Gorman possesses singular facility of expression, and one hopes that at future meetings of the Aeronautical Society, of whose Council he is a member, he will now be able to find time to give the members more of those entertaining little speeches which were so valued a feature of the pre-war meetings of the Society.

Admiralty, Sept. 27th.

Sept. 29th.—R.N.A.S.—Flt. Comdr. T. A. Rainey, R.N., who relinquishes his appt. on account of ill-health contracted in the Service, to retain his rank, Sept. 17th.

War Office, Oct. 2nd.

REGULAR FORCES.—Staff.—Attd. to Hdqr. Units.—The following temp. appt. is made at the War Office:—

Staff Lt.—Temp. Lt. J. E. B. Thornely, Gen. List, from a Flying Officer, Aug. 31st.

Establishments.—R.F.C.—Mil. Wing.—Flt. Comdrs.—From Flying Officers:—Lt. P. V. Tanner, Spec. Res., and to be temp. Capt. whilst so empld., July 18th. Maj. E. G. Joy, Canadian Local Forces; temp. Capt. H. R. Coningsby, Midd'x R.; Capt. G. E. Chadwick, M.C., E. Lan. R.; and to be temp. Capts. whilst so empld.:—Temp. Lt. H. E. Scoones, Gen. List; temp. Lt. W. M. Fry, M.C., Gen. List; temp. Lt. C. H. B. Readman, Gen. List; Lt. L. V. Hirst, Spec. Res.; Lt. C. Faber, Spec. Res., Sept. 1st. Temp. Sec. Lt. A. J. P. Hytch, Gen. List, Sept. 17th. Sec. Lt. (temp. Lt.) C. Eales, Devon. R., T.F.; temp. Sec. Lt. W. R. Fish, Gen. List, Sept. 18th.

Park Comdr.—Temp. Capt. L. Y. K. Murray, Gen. List, from an Equipment Officer, 1st Cl., and to be temp. Maj. whilst so empld., Aug. 31st.

Special Reserve of Officers.—Supplementary to Regular Corps.—R.F.C.—Mil. Wing.—Lts. (temp. Majs.) to be Capts.:—S. A. Currin, G. P. Grenfell, April 1. Sec. Lt. (temp. Maj.) T. G. Clarson to be Lt., Sept. 1st.

War Office, Oct. 3rd.

REGULAR FORCES—Establishments.—R.F.C.—Mil. Wing.—Flt. Comdr.—Temp. Sec. Lt. A. A. N. Pentland, Gen. List, from a Flying Officer, and to be temp. Capt. whilst so empld., Sept. 18th.

Equipment Officers, 1st Cl.—From the 2nd Cl., and to be temp. Capts. whilst so empld.:—Sec. Lt. (temp. Lt.) H. J. de C. Moore, Spec. Res., Aug. 31st. Qrmr. and Hon. Lt. (temp. Lt.) W. E. Aylwin, R.F.C., Sept. 10th.

Schools of Instruction.—Schools of Mil. Aeronautics.—Instr.—Graded as an Equipment Officer, 1st Cl.—Sec. Lt. (temp. Lt.) W. N. Cronshaw, E. Lan. R., T.F., from an Asst. Instr. (graded as an Equipment Officer, 2nd Cl.), and to be temp. Capt. whilst so empld., July 6th.

School of Technical Training.—Chief Instr.—Graded as a Park Comdr.—Lt. (temp. Capt.) C. G. Tucker, Spec. Res., an Equipment Officer, 1st Cl., and to be temp. Maj. whilst so empld., Sept. 10th.

Gen. List.—Sec. Lt. (temp. Lt.) E. S. Cohen, Spec. Res., an Equipment Officer, 2nd Cl., to be temp Capt. whilst specially empld., vice Lt. (temp. Capt.) C. H. Awcock, R.A., who relinquishes his temp. rank, Aug. 11th.

Memorandum.—To be temp. Hon. Capt.:—Temp. Hon. Lt. R. E. Rollings, whilst empld. as Inspr., Aeronautical Inspn. Dept., Aug. 1st.

* * *

The following is included in a list of decorations and medals conferred by the King of Serbia to the British Forces for distinguished services rendered during the course of the campaign:

Order of the White Eagle, 4th Class (with Swords).

Temp. Capt. Gilbert Ware Murlis Green, D.S.O., M.C., Gen List and R.F.C.

War Office, Oct. 4th.

REGULAR FORCES—Establishments.—R.F.C.—Mil. Wing.—Sqdn. Comdr.—Sec. Lt. (temp. Capt.) J. T. P. Whittaker, M.C., A.S.C., from a Flt. Comdr., and to be temp. Maj. whilst so empld., June 21st. (Substituted for notification of Aug. 31st.)

Flt. Comdrs.—From Flying Officers, and to be temp. Capts. whilst so empld.:—Temp. Sec. Lt. A. C. H. Groom, Gen. List, Sept. 18th. Lt. R. Duncan, Canadian Local Forces, Sept. 19th.

Oversea Contingents.—Canada.—Can. Gen. List.—Temp. Lt. (actg. Maj.) W. A. Bishop, V.C., D.S.O., M.C., to be temp. Capt., April 8th. Temp. Capt. M. R. Taylor is secd. for duty with the R.F.C., Aug. 31st.

War Office, Oct. 5th.

REGULAR FORCES.—The following N.C.O.'s to be Sec. Lts. for service in the Field:—

R.F.C.—Mil. Wing.—Actg. Sjt.-Maj. J. H. Ferguson, Aug. 1st. Sjt.-Maj. F. C. Griffin, Sjt.-Maj. C. W. Brown, Sept. 3rd.

N.C.O.'s to be temp. Sec. Lts.:—

R.F.C.—Mil. Wing.—Sjt. W. F. Mayoss, Sept. 1st. Flt. Sjt. W. W. Grant, Sept. 5th.

Establishments.—R.F.C.—Mil. Wing.—Staff Officer, 2nd Cl.—(Graded as a Brig.-Maj.).—Maj. A. H. W. Elias Wynn, Ind. Inf., Sept. 10th.

Flt. Comdr.—Sec. Lt. A. C. Youdale, Spec. Res., from a Flying Officer, and to be temp. Capt. whilst so empld., Sept. 21st.

Balloon Co. Comdr.—Graded as a Flt. Comdr.—Capt. G. F. M. Warner, R. Berks. R., from a Balloon Officer, Aug. 1st.

NAVAL.

The following appointments have been made in the Royal Naval Air Service :—

Oct. 4th.—Mr. E. L. Taylor granted a temp. commission as Lt., R.N.V.R., with seny. Oct. 3rd.

Oct. 5th.—Mr. H. Batsford entered as Lt., R.N.V.R. (temp.), seny. Sept. 28th.

Oct. 6th.—Proby. Flt. Officer (temp.).—B. H. Sisson, promoted to Flt. Sub-Lt. (temp.); seny. Sept. 10th; and to be Flt. Lt. (temp.), Oct. 4th.

The following temp. entries (R.N.V.R.) have been made :—Lt.—F. Rooks, seny. Oct. 4th. Sub-Lts.—H. Churchman and B. Walker, seny. Oct. 2nd and 6th.

A.M. (II.).—J. A. C. Sumner granted temp. commission as Lt. (R.N.V.R.), seny. Oct. 5th.

Admiralty Communiqués.

Oct. 2nd.—During the night of Sept. 30th naval aircraft dropped bombs on St. Denis Westrem aerodrome (south-west of Ghent), which fell among hangars and set fire to one on the south side. The fire spread, and was visible thirty miles away.

Bombs were dropped on Zeebrugge Lock gates.

Another bombing raid on St. Denis Westrem was carried out by day, at 12.30 p.m. on Oct. 1st, several direct hits being observed, also two sheds on fire in the south-east corner of aerodrome. The large shed on south side of the aerodrome reported as being hit and set on fire on Sunday night appears to be completely gutted.

All machines returned safely.

Oct. 3rd.—During the night of Oct. 1st-2nd a bombing raid by naval aircraft was carried out on lock gates at Zeebrugge. Many bombs were dropped.

Yesterday (Tuesday) afternoon an attack was made on St. Denis Westrem aerodrome, where a quantity of explosives was dropped on sheds and machines.

During usual fighter patrols two enemy aircraft were shot down out of control.

All our machines returned safely.

Oct 4th.—Bombing raids were carried out during yesterday (Wednesday) by naval aircraft on the following objectives :—

St. Denis Westrem,
Zeebrugge Lock Gates,
Bruges Dock and other targets.
Thourout Railway Junction.
All our machines returned safely.

The Casualty List.

Reported on Oct. 3rd.

Previously reported Missing, now reported Killed.—
Reeves, Flt. Lt. F. P., R.N.
Hillaby, Flt. Sub-Lt. E. C., R.N.
Ramsay, Flt. Sub-Lt. D. W., R.N.

Smith, Flt. Sub-Lt. H. D., R.N.

PERSONAL NOTICES.

Deaths.

DOUGLAS.—Lt. James Douglas, R.N., was killed while flying on Oct. 4th. The seaplane side-slipped and fell in the sea, and turning over pinned him under the water.

HILLABY.—Flt. Sub-Lt. Eric Crowther Hillaby, R.N., the second son of Dr. and Mrs. A. Hillaby, The Limes, Pontefract, who was previously reported missing on July 6th, 1917, is now reported by the Admiralty as killed on that date, aged 19. He joined the Grahame-White School of Aviation in January, 1916, and after a short course of instruction gained his pilot's certificate, and was gazetted Flight Sub-Lieut. in August, 1916. His Squadron Commander in a letter to his father described him as a valuable pilot and one who had made for himself an excellent name in his squadron.

LAUGHTON.—Sub-Lieut. Bertram Douglas Laughton, R.N.V.R., attd. R.F.C., who died from wounds received in aerial combat on Oct. 1st, was the younger son of Mrs. E. J. Laughton, of 35 Cloudesdale Road, London, S.W.17. He was 23 years of age.

NEWBERRY.—At an inquest at Edmonton on Oct. 4th on Flt. Comdr. John Newberry, R.N., aged 24, it was stated that on Sept. 28th he ascended from an Essex aerodrome with a Probationary Flight Officer, whom he was instructing. The machine suddenly nose-dived and fell to the ground. It was stated that the pupil lost his nerve in mid-air and clung on to the controls, thus preventing the pilot from handling the machine. Had the aeroplane been flying higher Flt. Comdr. Newberry might have been able to recover control. The probationary flight officer was stated to be still in hospital. A verdict of accidental death was returned.

Flt. Comdr. Newberry was the second son of Mr. and Mrs. C. Newberry, of the Orange Free State. He was born in South Africa, and was educated at St. Andrew's College, Grahamstown, where he gained the Goold Adams medal for science. In 1913 he entered King's College, Cambridge, and thence joined the R.N.A.S., having independently taken his pilot's certificate at the Beatty School. He became an instructor, and then went abroad, where his work with the French Air Service gained him the Croix de Guerre.

On Feb. 20th last he married Mollie, second daughter of Mr. H. P. Cowper, of New South Wales. Early in March he was moved to Dunkirk, and it was there he helped to bring down the first Hun actually over the town, for which the citizens presented him with a specially struck medal. Shortly after this he was given the rank of Flt. Comdr., and after a much-needed

rest took up instruction work at Chingford. It was here that the accident occurred which caused his death on Sept. 28th. The machine nose-dived from about 200 ft., and Flt. Comdr. Newberry only survived a few minutes.

RAMSAY.—Flt. Sub-Lt. Donald W. Ramsay, R.N.A.S., aged 20, who was reported missing on July 7th, while fighting over the enemy's lines, is now officially reported as killed on the same day. He was the second son of Mr. and Mrs. N. F. Ramsay, of 131, Osborne Road, Newcastle, and The Grange, Alnmouth. He was educated at Corchester Preparatory School, Corbridge-on-Tyne, and at Oundle, where in 1915 he was captain of the school and also captain of the Rugby XV.

His Squadron Commander has written to Mr. Ramsay's father:—"When I was leading a flight your son was with me, and I am proud to say was as staunch and reliable a follower as I had. We had been in many little fights together, and really had something in common with each other. He went out to do a job over the enemy's country, and was last seen keeping some enemy scouts off a machine he was protecting. It is well known in this squadron what a noble and gallant effort his was, and his place in the squadron will be hard to fill. He was a most good-natured and sterling officer, and loved by all with whom he came in contact."

THOMAS.—Flight Lieutenant John Emyr Thomas, R.N., second son of Mrs. Thomas, of 7, Castle Street, Ruthin, N. Wales, and brother of Mr. G. H. Thomas, N.P. Bank, Denbigh, who was killed while flying near Yeovil some weeks ago, was 23 years of age, and was educated at Ruthin Grammar School, Denbigh, and Wrexham County Schools, and was apprenticed to the engineering trade at Messrs. Singers, Coventry. He had only just served his apprenticeship when the war broke out, and he was among the first Denbighshire men to join the colours. He joined the Royal Naval Division in Sept. 1914, was with the division in Antwerp, and as a dispatch rider experienced his share of the rigours of the Gallipoli campaign, being temporarily invalided and being sent to Malta in November, 1915.

On his recovery he joined the Royal Naval Air Service in April, 1916, and "gaining his wings" developed into one of the most efficient men in the service. After flying on the Somme he was made a "ferry pilot," taking new machines over to France. Quiet, genial, and unobtrusive in manner, he had nevertheless any amount of grit in his composition, as his record in Gallipoli attested.

His Squadron Commander writes:—

"His duties necessitated a considerable amount of flying skill, in that he had to be prepared to fly every type of machine, and this I can say he did to my utmost satisfaction, having delivered innumerable machines from the various makers' works in this country to the war centres in France."

His Flight Commander writes:—

"He was one of the finest and most reliable pilots we have had, and the work of his department suffers very considerably owing to his absence."

VERNON.—Sqdn. Comdr. Theophilus Vernon, R.N., who was killed in an attempt to save a machine of his squadron, was second son of Mr. and Mrs. J. Y. V. Vernon.

WRIGHT.—Flt. Sub-Lt. Noel Stafford Wright, R.N. (killed on Sept. 18th), was son of Dr. and Mrs. Southey Wright, of The Firs, Wool, Dorset. He was in his 19th year, and had seniority of Jan. 21st, 1917.

Engagement

YOUNG—GROSE.—The marriage of Lt. T. Kenneth Young, R.N.V.R., and Miss H. Dorothy Grose, of "Tiutogel," Beckenham, will take place quietly on Oct. 27th at Elm Road Baptist Church, Beckenham, at 9 a.m. Will friends please accept this, the only invitation.

Marriages.

BARTHOLOMEW—SMERDON.—On Sept. 29th at Binfield Church, Flt. Lt. Cyril Hargreaves Farquharson Bartholomew, R.N.A.S., eldest son of Mr. and Mrs. James Bartholomew, of St. Leonards, was married to Nino, only daughter of the late Col. F. G. B. Smerdon and Mrs. Smerdon, of Binfield, Berks, by the Rev. O. S. Laurie, rector of Poplar, E., and the Rev. A. V. Richards.

MURRAY—THORPE.—On Sept. 26th, at the Parish Church, Great Yarmouth, by the Rev. H. H. Thorns, M.A., Rector of Rockland, Norfolk, Flt. Lt. Leslie Ethelbert Ruthven Murray, R.N., elder son of Mr. and Mrs. Ethelbert T. Ruthven Murray, of The Eyrie, Radlett, Hertfordshire, and eldest grandson of the late Sir James A. H. Murray, LL.D., D.C.L., of Oxford, was married to Ethel Mildred Dorothy, younger daughter of Mr. and Mrs. H. L. Thorpe, of Westhaye, Salisbury Road, Great Yarmouth.

The "Morning Post" of Oct. 6th published some further reports of how the Navy deals with the air and submarine services of the enemy. Here, for instance, is an account by a Squadron-Commander of the Royal Naval Air Service after a recent hostile air raid. He had been flying continuously under war conditions in France, bombing and fighting, for upwards of 18 months.

"When at 11,000 feet," runs his report, "I saw 10 Gothas coming inland. I climbed up to them, and engaged one on the right of the formation, about three miles out to sea, at something over 12,000 feet. Fired 100 rounds from straight behind his tail at 100 yards range. Bullets were seen to enter the Gotha's fuselage. Machine started into a slow spin. I followed and fired about 25 more into him to make sure. My gun then jammed; and, in trying to clear, I got into a very fast spin with my engines on. Got out of this just in time to see the enemy crash into the sea.

"I then landed, had my gun jam cleared, and went up after the remaining eight Gothas—one had been shot down in flames—and caught up with them at 14,000 feet, and engaged them in turn from both above and below. Then devoted all my attention to one Gotha, and after firing 200 rounds into him, silenced both his guns. I think both German gunners must have been hit, as I was able to get within 60 feet of him without being fired at. I finally ran out of ammunition."

Two British seaplanes on submarine patrol above the North Sea sighted a submarine on the surface travelling at about 14 knots. Two men were observed on the conning-tower. The seaplanes swooped down to a height of 800 feet, and the leading machine dropped a bomb, which burst on the starboard side of the submarine half-way between the stern and conning-tower. The submarine heeled slowly over to port and remained in that position. The bow rose into the air as she stopped and began to sink.

The second seaplane then dropped her bomb, which burst in front of the conning-tower, and as the submarine sank another bomb was dropped by the first machine, which had wheeled round and passed over the spot 15 seconds later. Having disposed of their quarry, the two then circled round for a quarter of an hour searching for possible survivors. None were seen.

On another occasion a seaplane on patrol overheard a hostile wireless signal, apparently in close proximity; shortly afterwards a large submarine was sighted lying on the surface a mile ahead. Flying at 80 miles an hour, the seaplane whizzed over the enemy and released a bomb. The submarine simultaneously fired a round with his foremost gun, the shell bursting 50 feet in front of the seaplane. As the latter turned, the bomb which he had dropped exploded, tearing a great rent in the hull of the submarine.

Flashes of flame were then seen spurting from the water ahead, and through the mist three more hostile submarines were sighted in line abreast, reinforced by three hostile destroyers and two seaplanes. All were firing at the British seaplane, which, however, turned and again flew over the sinking submarine. A second bomb was dropped, and the submarine sank, leaving a large quantity of oil, air-bubbles, and wreckage floating on the surface. Her bombs exhausted, the seaplane returned; having first photographed the sinking submarine and its would-be avengers.

MILITARY.

G.H.Q. Communiqués.

Oct. 2nd, 9.30 p.m.—On the 1st inst. a heavy ground mist hindered aerial work until the evening. Some successful observation was then accomplished for the artillery, and our aeroplanes took many photographs.

Bombing was again carried out by day and night. Gontrode aerodrome (south-east of Ghent) was twice attacked, and several bombs were observed to burst on the sheds. Carnières aerodrome, near Cambrai, was also bombed, and a large hangar was hit. Two attacks were made on a German long-range gun and two others on hostile billets in the battle area.

During the month of Sept. 125 tons of bombs have been dropped by our aeroplanes on various enemy targets.

Hostile aircraft were not particularly active during the day, but carried out some bombing by night. Five German machines were brought down and three others driven down out of control.

Two of our aeroplanes are missing.

Oct. 3rd, 9.13 p.m.—On the 2nd inst. weather was again misty, but in spite of this much successful observation work was done for the artillery and many photographs were taken. Some of these showed the damage done by our bombing raids.

About eight tons of bombs were dropped by our aeroplanes on various targets, and hits were observed on three aerodromes in the Courtrai area and on a fourth near Cambrai. Huts and dumps near Douai and sidings at Roulers were also successfully attacked.

The enemy generally avoided our fighting aeroplanes, but attacked our long-distance bombing machines vigorously when far east of the line. Six German machines were brought down in air fighting and four others were driven down out of control. Six of our aeroplanes are missing.

Oct. 4th, 10.11 p.m.—The weather, which, during our preparations for the attack (east of Ypres), gave promise of continu-

From a painting by Mr. SANDFORD PITT.

KINDLY MENTION "THE AEROPLANE" WHEN CORRESPONDING WITH ADVERTISERS.

ing to be favourable, yesterday became less settled. The wind steadily increased, and last night and throughout the battle has blown strongly from the west, at times with the force of a gale, and has been accompanied by storms of rain. These adverse conditions added to the difficulties of the advance and to the work of our aviators. Notwithstanding this, our aircraft performed valuable work, and afforded useful information from time to time both regarding the positions of our own troops and the assembly of the enemy for counter-attack.

On the 3rd inst. low clouds and a high west wind made aerial work almost impossible.

In spite of these conditions a little artillery work was carried out, and four of our machines attempted to bomb one of the enemy's aerodromes.

One of these machines reached and bombed its objective, and two succeeded in dropping their bombs on other targets behind the enemy's lines.

Very few hostile aircraft were seen.

One German aeroplane was driven down out of control, and one of our machines is missing.

A later report shows that a seventh hostile machine was brought down on the 2nd inst., in addition to the six already reported.

Oct. 5th., 10 p.m.—On the 4th instant the weather was almost impossible for flying, but, in spite of the rain, low clouds, and exceptionally strong wind, our artillery machines watched our advancing troops and reported their positions and the movements of the enemy.

Some of our fighting scouts flew over and attacked troops, transport, and guns from the air.

One of our machines is missing.

Oct. 6th, 10.1 p.m.—The weather on the 5th instant continued to be unsettled and stormy, and again made flying difficult. Successful artillery work was, nevertheless, accomplished, and many photographs were taken.

Enemy aerodromes in the Lille area were attacked with bombs. Railway stations at Westroosebeke (north-east of Poelcappelle), Iseghem (south-east of Roulers), and Courtrai (east by south of Ypres) were attacked during the day—the latter two were also attacked at night—and over two tons of explosives were dropped.

Enemy aircraft were active in the battle area. Four of his machines were brought down, and three driven down out of control.

Five of our machines are missing.

Oct. 7th, 9.57 p.m.—The weather was still very unfavourable for flying on the 6th inst., but a little artillery work was done. One and a-half tons of bombs were dropped on enemy targets, including a railway station, and our fighting machines went out whenever possible.

One failed to return; a bombing machine is also missing, which went out on the night of Oct. 4th-5th.

Oct. 8th, 10.14 p.m.—There was a short spell of fair weather on the 7th before the heavy rain which fell almost all day. While this lasted considerable work was done by our artillery machines, and our bombing machines dropped over two and a half tons of explosives on Staden and Courtrai (respectively north-east and east of Ypres) railway stations and other targets.

The enemy showed marked activity in the vicinity of our newly-won territory and attacked our bombing machines vigorously. Two hostile machines were brought down and three were driven down out of control.

One of our machines is missing.

War Office Communiqués.

Oct. 4th.—The G.O.C. British Forces in Macedonia reports:—

Our aeroplanes have carried out a most successful raid on an extensive scale, bombing the enemy's camps and dumps on the Belashitza Planina (north-west of the Struma Valley).

Hostile troops were scattered by machine-gun fire, and one of several enemy aeroplanes which attacked our formation was brought down near Matnica (north-west of Poroi).

All our machines returned safely.

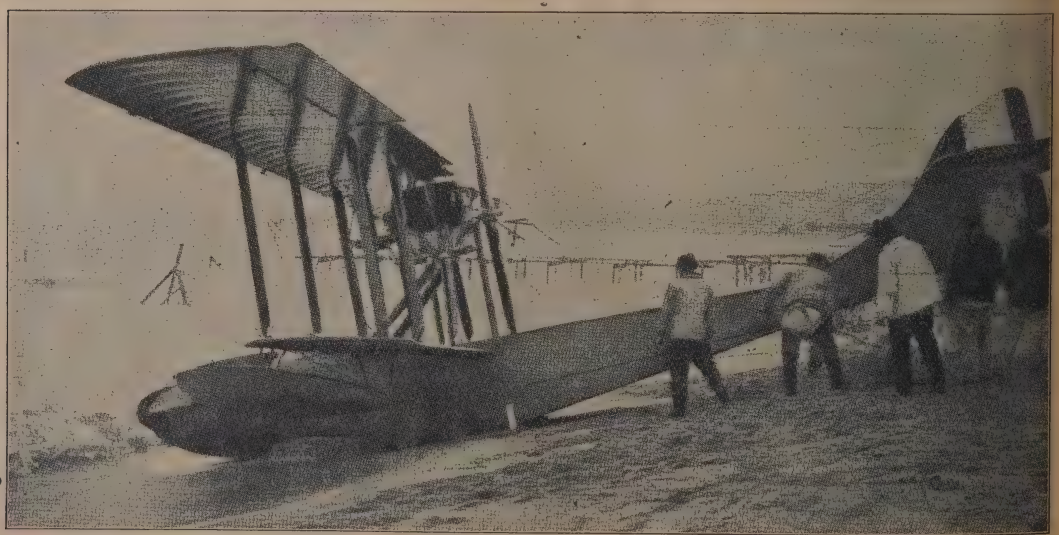
Oct. 8th.—The G.O.C. the British Forces in Macedonia reports:—On the morning of the 6th we successfully raided Akindzali and Bulamac (east of Lake Doiran). Our aeroplanes co-operated by dropping bombs on the enemy's batteries and engaging his infantry with machine-guns.

Our aircraft have also carried out bombing raids on Ciftlidzik (west of Demir Hissar), where a hostile anti-aircraft gun was put out of action, and on Cestovo (north-west of Lake Doiran), where an ammunition dump was damaged.

Home Command Communiqué

Oct. 2nd, 12.15 p.m.—The latest police reports state that in last night's air raid the casualties in all districts visited by the raiders were:— Killed, 10 Injured, 38.

The Casualty List.



Reported Oct. 3rd.

Killed.—Bailey, Sec. Lt. J. B., E. Yorks R., attd. R.F.C

PERSONAL NOTICES.

DEATH.

BALDWIN.—Sjt. Cuthbert Godfrey Baldwin, R.F.C., previously reported missing, now presumed to have been killed in action, was the eldest son of the late Rev. A. G. Baldwin, Vicar of Burnopfield, Durham, and of Mrs. Baldwin, 2, Priory Villas, Friern Barnet, N.11.

AIRCRAFT SUPPLIES.

OUR NEW PREMISES

are situated in the heart of London and adjoin two tube stations (Covent Garden and Leicester Square). In addition to the well-arranged General Offices of the Company, we have provided a spacious Show Room, which enables us to display, in orderly sequence, all the requisite parts and equipment for modern aircraft construction. Here actual fittings may be examined and supplies may be taken away without any delay whatever. The Stores contain nearly two thousand bins, comprising almost every conceivable standard aircraft part.

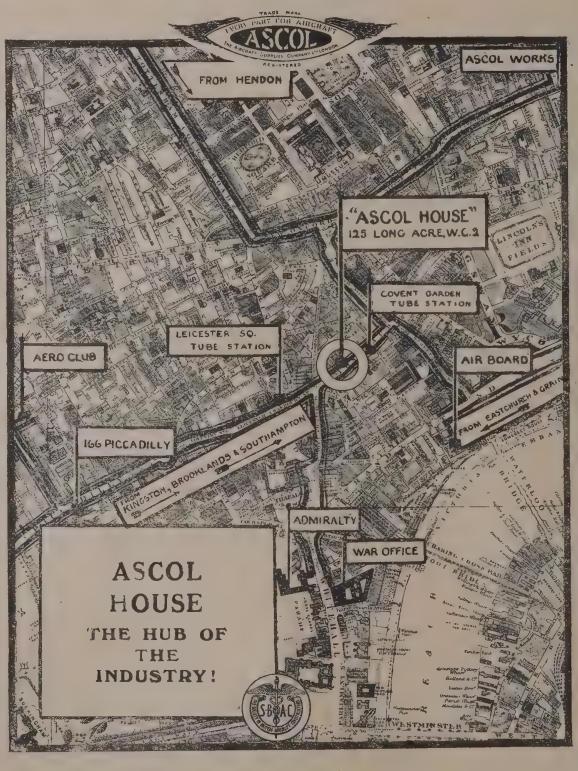
It will pay you to see our Fortnightly Stock and Quotation List!

FOR ILLUSTRATED STOCK AND QUOTATION LIST SEE

"AIRCRAFT SUPPLIES"

OUR FORTNIGHTLY HOUSE JOURNAL.

Vol. 2. No. 9. READY TO-DAY!



PUBLISHED fortnightly, on alternate Thursday evenings, and issued FREE to the Air Services and to the Aircraft Industry (those in charge of Stores and other Works or Service Departments ONLY), on application to the Secretary.

CONTAINS a complete LIST OF STOCK of Aircraft Parts up to the time of going to press, CURRENT PRICES, details of NEW ITEMS, ENQUIRY BUREAU, and other A.S.C. announcements. A SHORT ARTICLE will also appear in each issue on a topic of interest to Aircraft Constructors.

STOCK LIST contains over 400 items.

A.G.S. and other STANDARD PARTS from STOCK.

SPECIAL AIRCRAFT and ENGINE PARTS for EARLY DELIVERY FROM OUR OWN WORKS.

"The A.G.S. Book"

By BERNARD ISAAC.

130 Pages. Over 230 Illustrations.

AN IMPORTANT WORK of REFERENCE FOR THE AIRCRAFT INDUSTRY AND THE AIR SERVICES.

CONTENTS.

CHARTS of A.G.S. Rafwires, Tie Rods and Joints, Nuts, Bolts, etc., covering extracts from 82 blue prints—Metric Equivalent Charts—Numerical List of A.G.S. Parts—Alphabetical List of A.G.S. Parts—A.G.S. and other Screw Thread Systems—A.G.S. Standard for Bolt Heads and Nuts—Photographs, Drawings and Dimensions of all important A.G.S. Parts—A.G.S. Fits and Limits—Test Pieces—Articles on "Standardization of Aircraft Parts" and "Accelerating Aircraft Output"—Chart of Admiralty Strainers—Illustrations of R.A.F. and other Aircraft Parts, etc., etc., etc.

THE "A.G.S. BOOK" is issued to **approved applications** from the Air Services and the Aircraft Industry. Persons connected with the Aircraft Industry should make application through their firms. Applications from the Air Services should be made through the Commanding Officer. One copy is supplied **free** to each firm, and additional copies may be obtained at 2/6 each, the whole of the proceeds, without deduction, being given to The Royal Aero Club Flying Services Fund.

APPLICATIONS must be made on the special forms which may be had from The Aircraft Supplies Co., Ltd., 166, PICCADILLY, LONDON, W.1.

SUPPLEMENT TO "THE AEROPLANE"

INCORPORATING AIRCRAFT ENGINEERING, AERODYNAMICS, AND MATTERS PERTAINING TO THE AERONAUTICAL ENGINEER AND THE AIRCRAFT TRADER

Fits, Mis-Fits, and Limits Aeronautical.

(Applied to Things Material rather than to Personnel.)

BY V. P. BENEDICT.

Terms of Reference.

To supply enlightenment to the uninitiated on the subject of "fits" and the "limits" outside of which they become "mis-fits," is the object of the following paragraphs.

For information as to the medical application of the former term, my readers are referred to any appropriate work on the subject (or to their medical officer), and the relation of the two latter to official departments is the subject of frequent editorial comment in this journal.

Reference of Terms.

Fits.—This term, fits, has reference to the quality of two or more components to assemble together with a greater or lesser degree, either of firmness or workable freeness, according to their relative functions one with the other.

Example.—The function of a crank-shaft demands that it shall rotate freely in its bearings, therefore, the term "running-fit" is applicable to the portions in contact. If the difference in diameter size between them is too great, sloppiness or play results. Line contact only is obtained, with consequent rapid wear or displacement of the metal under the pressure involved.

If there is too small a difference, they decline to function owing to friction, or if the necessary force is applied to produce rotation, something happens—in the case of soft or white-metal bearings these may take up the quality of running, but in the sense due to fusion.

Allowances.—To ensure obtaining the desired fit, it is the designer's part to state the dimensions in which "allowance" is made to provide the correct functioning demanded.

The need for an "allowance" may stand explanation. The idea popularly held that a round or other section-piece of given diameter will freely assemble in a hole of corresponding shape and exactly the same dimensions is fallacious. To get, say, a one-inch peg into a dead size one-inch hole would be almost as much some job as would be the making of them to dead accuracy or the measuring of them when made.

So in practice, if it is desired that a part shall assemble freely in a given hole, that part is made slightly less in dimension than the hole, which is termed making an "allowance."

Tolerances.—The term "allowance" is not to be confused with the term "tolerance," this latter being the extent of variation from stated size, which is permissible for errors in workmanship. This is a very necessary provision, even with skilled hands using the very best of facilities, and is more obviously essential when arranging the repetition production of aeroplane and engine parts by semi or unskilled labour.

Limits.—"Limits" is a term denoting dimensions in which both allowance and tolerance are combined.

In application, thus:—Say a shaft is needed one-inch in diameter and to be a free running-fit in the corresponding hole. First, must be allowed a tolerance for error in the hole and a similar tolerance for error in the shaft, while between the smallest diameter thus permitted to the hole and the largest size allowed on the shaft, must be inserted a dimension of allowance for fit.

To illustrate:—The tolerance for a one-inch hole is usually put at from half-a-thousandth oversize to a quarter-thousandth undersize, and stated thus:—1 in. plus 0.0005 in., minus 0.00025 in.; or thus, high, 1.0005 in.; low, 0.99975 in., from which it is to be understood that the hole size is not to exceed half-a-thousandth over one inch, nor to be under one-inch less a quarter-thousandth. A total tolerance is thus allowed of three-quarters of a thousandth inch (0.00075 in.). Since it is usual to make allowance on the shaft or male part, the above figures will form the limits for the hole size.

For the shaft—since the hole may be as small as 0.99975 in.—it will be obviously necessary that the largest permissible size be something less than this figure. So here the allowance for fit is inserted, fixing the high limit for the shaft at 0.9995 in., equal to a quarter-thousandth, minimum clearance. Then is allowed the tolerance for error, taken at a further quarter-thousandth, fixing the low limit for shaft diameter at 0.99925 in., and the maximum clearance at one-thousandth of an inch (0.001 in.), which is the difference between 1.00025 in., largest permissible hole, and 0.99925 in., smallest permitted shaft diameter.

Shafts and holes produced within the above limits would be absolutely certain to assemble interchangeably, and to give a nice running-fit, particularly since, in repetition practice, the extremes would seldom meet, and the average difference would, therefore, run about half-a-thousandth.

The extent, both of tolerance and allowance, will, of course, depend on the grade of work to which applied, to the materials used, the machining finish called for, and also to the ratio of length to diameter. In the case of aero-engines and 'plane parts the limits naturally are really fine.

Necessity, the Mother of—Achievement.

Achievements.—In my verdant days, when first introduced to thousandth parts of an inch, I have hazy recollections either of scoffing or marvelling thereat. Now, in the fulness from the ocean of knowledge of my own cup—albeit a small one—I can of petty wisdom's magnanimity appreciate somewhat that, to the lay-mind, it may sound in the regions of the ridiculous to talk of half-thousandths of an inch, let alone to expect the production of parts by unskilled labour to such degrees of fineness.

So to dispel any such fog of delusion, the following review shows how far present-day capacity for minuteness in measurements actually carries.

A one-millionth part of an inch—think of it, a thousandth-part of a thousandth—is, incredible though it may seem, a measurable quantity. Yet is it more amazing than the assay of minute quantities of gold to define the small percentage of base metal contained therein?

Naturally, dimensions in millionths can be handled only by very special scientific gadgets, employed almost solely in checking microscopic work for such uses as astronomical instruments, where an error of a thousandth might mean the devil to pay, by causing a couple of planets to collide—on paper.

The method employed is based on the wave length of certain kinds of light, and on what is known as the interruption thereof, and is so costly in time and apparatus as to be clean out of court for practical application even to so specialised an industry as the construction of aeroplanes.

Ten times a millionth—a one-hundred-thousandth—still well in the realms of the minute, is, nevertheless, within the capacity of a special mechanical measuring device used in many of the larger and better equipped works for checking sizes of accurate gauges.

Describable broadly as a glorified micrometer—an instrument with which every worker in metal for aircraft ought to be reasonably familiar—the machine consists of a frame with a gap, into which projects the end of a fine pitch screw carrying a fairly large wheel calibrated round the rim to read minute portions of a turn.

The piece to be measured is laid in the gap against the side opposite to the screw, which is then brought into contact by turning the wheel. Each complete turn is a fortieth-part of an inch, and the rim is divided into 250 parts, so that each represents a ten-thousandth part of an inch. By means of a vernier rule attached, one-tenth of this can be read off, equalling hundred-thousandths.

A similar machine graduated in millimetres has a finer pitch-screw and reads to a ten-thousandth part of a mm., equal to only four one-millionths of an inch (approximately).

Measuring Ten-Thousandths.

So by tenths one comes to ten-thousandths, actually the finest degree likely to be called for, and then only for the most important of gauge work. And even gauges are seldom tied to a closer tolerance than from two to four ten-thousandths, according to size and application.

Micrometers are made provided with vernier rules to give readings in ten-thousandths of an inch, but even if accurate to this degree when brand new, it is doubtful if they are to be sworn to after a few weeks' wear, particularly since very delicate touch would be needed to adjust the screw every time to exactly the same tension. Such vernier micrometers have, of course, their uses in fixing divisions less than a thousandth nearer to the mark than would be possible by judgment and eyesight otherwise assisted.

In thousandths and half-thousandths parts of an inch run the general limits for the finest production work—measurements which, in view of preceding remarks, might almost be called coarse. They are, in fact, sufficiently broad to permit of being attained by semi-skilled labour on repetition production, but per contra they are fine enough to demand the most ingenious and perfected of manufacturing appliances backed by the keenest supervision through the medium of what is known as the Limit Gauge System, to be described in a later issue.

Necessity the Mother.

Since even things abstract have, or should have, in war-time particularly, a sole object in utility, one is moved to inquire into the very genuine necessity, shown by the results of many years' practice, and the studied conclusions based thereon by leading experts, to obtain for these—to the unfamiliar, keen—standards of measurements.

Take a ¼-in. or ⅜-in. diameter pin, of which dozens are used on every aeroplane for swivels, fork ends, valve-rocking levers, and similar, where a free working fit without wobble or play is necessary. Here—if the hole is accurate, as it should be—half a thousandth undersize in the pin will give a nice easy working fit, while a second half-thousandth would mean absolute sloppiness, with corresponding short life, owing to rapid and uneven wear. Oppositely, if the pin were not a half a thousandth under the hole size, it would only assemble to give a tight fit, or possibly would not go together at all without persuasion of the four-pound hammer type.

To view the importance of accuracy in running or sliding-fits in correct perspective, it needs be borne in mind that the play or sloppiness—albeit in itself, and for its own sake, objectionable—is none the less but an outward manifestation of a deeper and more potent ill.

In an efficient and long-lived bearing it is essential that the surfaces of contact be as wide an arc of the full circle as possible. Theoretically, the load should be spread over the full half-circle divided by the line of load, thus to distribute the load over as much area as possible, and also to ensure that essential smooth sliding action between the rotating portion and its bearing round a centre common to both

Where there is much negative difference in size between the shaft and hole, the surface of contact is limited to a fine line (modified somewhat by enlargement due to elasticity of the metals which compress under stress), and thus the whole load is concentrated over a small area with consequent rapid wear in the direction of the load.

Where the direction or extent of the thrust is not constant, wear occurs unevenly in different places, with the result that the centre of resistance jumps about and fails to correspond to the centre of load, setting up friction and torsions which—if nothing worse—detract from efficiency.

An example of inconstant load is found in the bearings—big and small ends—of a connecting-rod. Any car or motor-cycle owner knows (probably from experience) that only a few thousandths of play resulting from wear are needed to generate "Ford music," while, on the other hand, the least sign of tightness may set up enough friction in the bearings and between the pistons and cylinder-walls to knock 50 per cent. off the revolving capabilities of the engine.

And the loss of efficiency from a long crankshaft distorting when its bearings wear out of alignment needs to be experienced to be appreciated, but is understandable, given a conception of the amount of energy expended in bending what is probably a two-inch section of high tensile, hardened and toughened steel, some thousand or two times per minute, even if the deflection is only an infinitesimal fraction of an inch.

Which is some of the difference between a rolling Ford (Ford drivers will appreciate), and a Rolls-Royce, and the same is partly why aeroplanes are not, as yet, a proposition for the million.

Uniformity Essential.

To get on with the Agenda. Consider the necessity for accuracy, as established on the score of working efficiency alone, and quite apart from the all-important phase interchangeability, take reams unwritten as read, or for granted, and let us back to the straight and strict path from which all this divergence is perhaps but journalistic trapping, designed to make printable length of facts dry in their fewness and compactness. If therein is anything educative or informative of your charity write it down rather to blind chance than to malice aforethought.

Obviously, to work accurately for efficiency and interchangeability implies strict uniformity of practice, since one man's meat must prove no man's poison, and, as perchance, a shaft turned in Brummagem may, under the stress of war, meet in Baghdad introduction with a hole fra' Lancasheer ("If yer knows a better 'ole," etc.), we must have some consistent basis on which all tolerances and allowances are framed.

Although not universally used, nor in agreement with the findings of the Engineering Standards Committee, who, however, have not yet gone very far with this particular question, such a basis exists in the Tables known as Newall's Standards, which are *officially approved for aero-construction purposes.*

Any drawing which calls for fits under the lettering x, y, z, or as 1st, 2nd, or 3rd grade, for force-driving or push-fits, or for holes Class A or B, grade 1 or 2, may, unless the contrary is definitely stated thereon, be taken as based on Newall's Table.

These tables provide for tolerances in producing holes of sizes up to 12 in., and specify the limits—covering allowances and tolerances—to be applied in producing shafts to give any desired fit.

Dimensioned in both English and Metric measures, these tables will be found printed on the next page of this article, and, in addition, is given a very useful list of tolerances for various purposes in aero-construction, such as are not covered by the term Fits.

Not Hard and Fast.

The Newall Standards are not intended to be arbitrary, but need be read in conjunction with a fair amount of "common savvy," in so much as they are subject to modification according to (a) the ratio of length to diameter; (b) materials to which applied; and (c) machining finish called for.

As instance (a) if the length of bearing is excessively short, equal, say, to three-fourths the diameter, the limits given for a Z or 1st grade shaft will allow a quite free fit, whereas in a very long bearing the same freeness would demand quality Y, which is giving slightly more allowance.

Instance, again, illustrating b and c in fixing allowance for a driving fit, where both the shaft and the hole are to be ground in steel or cast-iron, much closer figures can be used than where, say, a plain turned-finish steel shaft or bush is to be forced into an aluminium casting.

The factor of length ratio is further important from the very general aptitude of long shafts—particularly if hardened—to take on a set or to warp after being machined, due to internal stresses existing in all materials and liable to cause distortion, particularly after removal of portions of the metal in machining.

Metal "Seasons" like Wood.

So positive is this liability to change of form, that in producing a really accurate and fine piece of work, say for scientific purposes, or even very high grade machine tool beds and shafts, it is essential practice to give a "seasoning" period of from a few days to several months, after each removal of metal, and thus to allow the structure to settle down.

THE TABLES OF LIMITS REVIEWED.

As a final preliminary to the tables, and to assist in their proper application, attention is directed in the following paragraphs to the essential features and points to be noted.

HOLES.

The first subject covered is tolerance for error in standard holes, with a schedule of differences from given sizes which are permissible in work of acceptable accuracy. The term "Standard Holes" implies working to given size as near as is commercially practicable.

This is of primary importance for the reason that the basis of interchangeability is strict uniformity in the size of the hole, leaving all allowances for fit to be made on the shaft or counterpart.

The why and the wherefore being that in repetition work holes can be finished by means of reamers, or, like cutting tools, to a very close standard of accuracy, and uniform as to size within a very narrow margin. If the tools are reasonably well made and used with ordinary care, they will reproduce with amazingly

little variation in size, particularly as they are usually reserved for finishing light cuts after the bulk of the stock has been removed by drilling, punching, or boring. The surface-finish of a reamered hole should be beautifully smooth and even.

Taking the hole size as basis for uniformity is considered preferable, chiefly from the economy point of view, as outside diameters usually are produced on machines with adjustable cutting tools, thus enabling any desired size to be set up with a facility depending only on the fineness of the working tolerance allowed. Whereas to make variations in half-thousandths in hole sizes—particularly small ones—would entail a multiplicity of reamers with the resultant vast increase in equipment costs.

Newall gives two sets of tolerances called A and B, or 1st and 2nd grade. First grade holes are invariably used where good fits either running, push or sliding are required, and the second grade applies to holes of less primary importance where the accuracy is less essential, and permits advantage to be taken of the much cheaper production made possible by even a small widening of the tolerances.

Class A holes will be found necessary on all engine-bearings, con-rod big and small ends, gudgeon-pin bushes, valve and valve tappet, and push-rod guides, oil, water and air-pump cylinders, and for shaft holes in gears and sprockets, whether for running free, or to be keyed to shaft.

Second Grade or B holes occur where the working fit is less primary in importance, as example, swivels, forks, levers and pulleys for controls, hinges and sockets, and all places where the rotary of sliding motion is not constant or wide in extent. Also they are generally permitted for sockets and recesses where the function is simply accurately to position the part inserted, as in the case of cylinder-seats, crankcases, and inspection covers, tube, lugs, and clips, etc.

SHAFTS.

Provision is made for six different shaft-fits—graded from force-fits needing hydraulic or similar presses to assemble, down to quite free running or sliding allowance.

Force-Fits.

Shafts to the limits under this heading are intended for permanent assembly. They require to be driven home under heavy pressure, or shrunk on by heating the female portion to expand the hole size while the cold shaft is inserted, after which the contraction consequent upon cooling creates a solid binding grip between the two.

Permanence of joint is such, owing to the pressures involved, that in a short time the metals take on a set under the compression which generally makes it impossible to separate the parts without incurring the absolute destruction of one or the other.

Force-fits are seldom met with in aero construction, but belong more particularly to the heavier engineering trades—railway and shipbuilding.

Driving-Fits.

A considerably less intimate connection is here provided, but, nevertheless, such requires force to assemble, usually applied by a light screw press. It can be done between the centres of a lathe using the back centre screw to apply the push—but not advisable if the foreman is about, nor if it happens to be your own working lathe. Also, it is frequently accomplished with a "coaxer" or mallet, another method crude and unjustifiable—unless nobody of importance happens to be around. (Second A.M.'s please note.)

A driving-fit is intended for application to bushes for bearings, valve and tappet guide insertion, pipe flanges, and such jobs, giving a permanent joint in the sense that they can only be dissembled by force, and at the risk of destroying the binding effect when the two are re-assembled.

Caution Needed.

Driving-fits provide an example where careful judgment must be exercised in applying the limits to differing materials. The allowance on a gun-metal bush to ensure permanent fixture in an aluminium casing will need to be slightly in excess of the figure given, and per contra, will be reduced somewhat in the case of a hardened steel bush or pin to be inserted in an iron casting.

Push-Fits.

Push-fits are used mostly in conjunction with provision for such things as bolts, setpins, split rings, or cotter pins for fixing in position, and for ease of detachment. They are applied where no motion—rotary or sliding—is needed, and are called for usually with Class B holes, on cylinder-seats, detachable valve housings, covers, plugs and fillers, ball-bearing housings and shafts, keyed shafts, pipe flanges, and sockets, all where the chief function is to position. Also, they are used on tube clips, lugs and sockets, for welding or brazing in position, and on hinge and fork and pins.

As implied by the description the fit intended is one which can be easily pushed home but is not free enough to allow rotation at any speed or free sliding.

Running-Fits.

Allowances to provide three grades of coarseness in running-fits are given. Here, again, judgment is called for, since the tables must be applied with due regard to various factors. Have careful regard to length ratio, running speed intended, machining finish, and materials used. Also, and this is important, where there is liability to change of temperature, allow for expansion and contraction.

Classes Y and Z are those most frequently called for, and generally **Z**, being the finest grade, is used in conjunction with holes Class A. Y is used much on engines where heating up occurs, and also on shafts of secondary importance, and where very little relative motion is needed.

And a Final Explanation.

For the reason, probably, that English micrometers are so calibrated, it has somehow come to be usual to visualise fine measurements in thousandths of an inch, and to refer to quarter, half, and three-quarter thousandths, instead of using fifth and sixth decimal places which, of course, is the strictly academic method.

Obviously, it is easier to appreciate a quarter of a thousandth than its decimal equivalent of 25 one hundred thousandths (.00025 in.). Even the most precise and exacting would automatically call it two and a half ten-thousandths—nought but a compromise, and, as such, with advantage, to be avoided.

All of which is to be read in the explanatory vein, neither apologetic nor yet that excusing which accuses, for since this journal never was, is not, nor, fervently one hopes, ever will be, hide-bound by precedent, the Tables—unconfused by noughts—are printed with all the English limits dimensioned in thousandths of an inch, and quarter, half, and three-quarter thousandths.

And if departing thus from well-trodden paths makes for economy of printers' time and of ink, this virtue is, indeed, its own reward, but lest advantage lie all on the one side, you readers are made free of the clarity achieved thereby. For, of certainty, it is well to be rid when possible of noughts and dots—stand they in solitary state or massed in serried ranks. Which remarks, *naturellement*, imply no disdain on my part for the two noughts which invariably figure on my weekly salary cheque.—(£0 os. 9d.—Ed.)

USEFUL MEMORANDA OF TOLERANCES OTHER THAN FOR FITS.

The following notes apply only where definite limits are not specified :—

Bolt and Screw Holes, Diameter of.—Provided sufficiently large freely to accommodate the size of bolt or screw called for, a few thousandths of an inch are not important. The usual practice is to drill either 1/64th or 1/32 in. larger than bolt size. Many drawings call for holes to one or the other of these two dimensions. Thus, a hole for ¼-in. bolt may be definitely dimensioned 17/64ths or 9/32nds. If it be simply specified "hole for ¼-in. bolt," either of these two drills would suit. Over about ½-in. or ⅝-in., allow the 1/32nd clearance.

Being unimportant, it is sufficient simply to drill or punch, reamering being unnecessary.

Bolt Screw, etc., Holes, Distance between.—Tolerances are not usually here stated, but an error can generally be allowed equal to the clearance in the hole diameter. Thus, if this is 1/32, the same amount, either over or under in the distance between, would just permit of assembly.

Care must be exercised, where there are more than two holes, not to get a progressive error as, if several holes in a straight run were each 1/32nd over or under in distance from the neighbouring ones, the total error between extremes would be considerable.

Holes for Rivets.—It is usually correct to use a drill of the same diameter as the rivet specified. The small error usual in drilled holes will not be detrimental.

Holes, other than already provided for.—Such as lightening holes should be kept to size or about 0.004 in. *under*. It is always preferable to work undersize, thus permitting correction by enlarging if objection should be taken.

Machined diameters.—The standard tolerance on external diameters is up to 0.004 in. oversize.

Machined lengths and thicknesses.—If machined all over these are acceptable from size to plus 0.004 in. If machined one side only—and the other left rough—allow tolerance oversize up to 4 or 5 per cent of drawing figure provided the excess will not interfere with assembly. In this latter case it is probable that limits are given on drawing—anyway, they ought to be—and if there be any possible doubt, I advise referring the point to someone with authority to decide it.

Casting and forging dimensions.—Where not to be machined the thicknesses may be up to 8 or 10 per cent. oversize.

Washers, plain, for Bolts, Studs and Screws.—Hole same tolerance as for bolt holes. Thickness allow plus or minus

from 0.003 to 0.008 in., according whether light or heavy section. Outside diameter, plus or minus 1/32nd or 0.030 in.

Bolt, Stud, or Screw Shanks, diameter of.—Plain portion from nominal size up to plus 0.004 in.

Bolt, Stud and Screw Shanks, length.—Size to plus 0.030 in. in the shorter ones up to, say, 2 in.; over, allow up to 0.050 in.

Bolt Head and Hexagon Nuts.—Width across flats plus or minus 0.003 in. to 0.005 in., according to size. Generally governed by the error in dimension of the bar stock used. Thickness, plus up to 0.010 in. in small sizes, say, to 5/16 in. tapped. Over this, up to 0.020 plus.

Radius round Holes, in pressed work or machined parts, such as Eyebolts, Sockets, Clips, etc.—Tolerance depends somewhat on that allowed in the hole. Should always be kept on the full side by more than half the hole tolerance taken. Usually designed to leave a width of metal surrounding the hole equal to or slightly exceeding hole diameter.

Thickness of Sheet-metal parts.—Tolerance governed by thickness of metal used, and should be acceptable at from 0.002 in. to 0.004 in. undersize, or 0.004 in. to 0.008 in. over. Error on plus side always safest.

Tube, outside diameter.—If limit unspecified should be within 0.001 in., up or down, for each ¼in. of diameter up to 1 in. Over this size a further 0.001 in. for each succeeding half inch.

Internal diameter should follow within 0.002 in., the error occurring in outside diameter, thus limiting error in wall thickness to this amount. In tubes over 16 or 18 gauge the error allowed may be up to 0.003 in.—V. P. B.

The Production of Aeroplanes and their Components

(Sixteenth Instalment.)

BY STEPNEY BLAKENEY.

Having dealt with the construction of many metal parts necessary for the construction of aircraft, and possibly sufficiently to enable those new to the Industry to gain some insight, one may as well next deal with the finishing up of the various parts of the machine.

These important component parts may be dealt with in the following order, namely, the centre-section plane, the top and bottom main planes and ailerons, the tail plane and elevators, the fin and the rudder and fuselage.

The Centre Section.

The centre plane being of wood, it will be sent to the paint and varnishing department, where it will receive (subject to this system being adopted by the management) two coats of spirit-varnish all over, then the small riblets and rib-noses will be covered top and bottom sides by a strip of half-inch India tape, glued on, the total length of which will be about 2 ft. 3 in. for each length of tape.

As soon as the glue is dry and set, the top and bottom edges of all parts, forming the centre plane, will receive one good coat of white dope-resisting paint, as will all fittings, tie rods, wiring plates, bolts and nuts. The centre plane will then be ready for inspection by the A.I.D.

The same process applies to the main planes, tail planes, elevators, fins and rudders, with regard to the white dope-resisting coat of paint. Of course, spirit-varnish is not put on steel-tube constructions, which are only painted with the dope-resisting paint.

Covering.

This work of painting having been carefully completed, these parts will be sent to the covering shop.

The centre plane is the first member to be covered. During the time the covering department has been waiting for these various components to come along it has been busy cutting out and machining up the covers, and putting the small eyelets for laces into the covers, and many other small jobs.

A Word of Warning.

Here I pause to point out a word of warning. Before attempting to fit on and stretch the covers taut and sew up, take care to see that the linen fabric is absolutely dry and well-aired. Unless you can be fully satisfied regarding this point, stop covering until you have taken the necessary steps to dry and air the fabric.

The reason for this is that however little percentage of dampness or moisture the fabric may contain it will be contracted in area, and however tight it may be stretched and sewn on, it will relax and become quite slack on coming in contact with the warm, dry air of the dope room. It is fairly safe to say that no amount of doping will succeed in bringing up the tautness of the fabric as it is required for first-class wings, and the finished article will be a disappointment.

Putting on the Fabric.

In covering the wings it is usual to put on the covers over the leading edge. Stretch the cover over the top and bottom of the ribs, then stretch the fabric to the trailing edge and tack down with a few fine gimp pins. Sometimes this is done with pins. The fabric should then be stretched lengthways and all seams straightened from the front to the back.

After which the two surplus ends of the fabric should be cut off, leaving only about half an inch of each end to turn in and make a seam. The sewing up of the seam may then be commenced.

The first stitch should be made by passing the needle through the fabric from the inside, pulling it through and passing over the edge, then across the gap to the fabric on the top of the wing. Here the needle is again passed from the inside of the fabric to the outside, and the stitches both drawn together (see Fig. 24). This has the effect of neatly and tightly drawing together the ends of the fabric.

Stringing.

The wing will now have to go through the process of "stringing." This consists of putting a loop of string over the fabric and round each rib, and knotting and carrying the end of the string about four inches farthur on and repeating the same operation. This is done to each rib, on which there will be about eight to nine loops.

This is for the purpose of attaching the fabric to the ribs, preventing the fabric ripping, and generally helping to distribute the load. The lines of string are afterwards covered with strips of fabric, with frayed edges, to give a neat, smooth and strong surface.

Doping.

The wing will now be ready for doping, and will be taken to the dope room. Before commencing doping the temperature of the room must be at least about 70 deg. Farenheit. This temperature is asked for not for the purpose of causing the contractor trouble and annoyance and the expense of putting in and maintaining a heating apparatus, but for the purpose of obtaining satisfactory results with the dope employed, namely, good adhesion, a smooth surface, and what may possibly appeal to the contractor, rapid production.

This remark specially applies to the coat of aeroplane varnish which is applied to the underside of the wings, as some makes of varnish will take seven to eight hours to dry and sometimes longer, and with a good temperature it is easy to save half an hour, which means a lot to the contractor whose space is limited, and thereby output is increased.

Doping Wings.

The wing which has to be doped can be laid on some trestles made a convenient height, say about 2 ft. 9 in. On these will be laid or fixed pieces of wood about the same length as the spars and the wing-spars will rest on these and nowhere else. Taking the weight these will prevent the fabric from being strained, and possibly punctured.

The dope will now be put into a can capable of holding, say about a quart, and with a narrow slot in the top like a letter-box slit, through which to put the brush. A brush about 4 in. wide should be used to spread the dope.

In putting on the dope it is necessary to put it on, and especially to spread it, quickly and evenly. Take plenty on the brush and work it evenly into the fabric backwards and forwards, and then finish by working it at right-angles to your last way of spreading. Then leave it to dry thoroughly before attempting the next operation.

In doping it may be as well to go to the trouble of instructing the dope hands that to dope a wing properly they should not attempt to start on about half-a-dozen spots at once, they must start at one end and work first of all on a small patch of, say, 2 ft. by 1 ft. 6 in., and finish this before starting elsewhere. By this means it may be possible to get an equal quantity of dope all over the wing, and not patches of dope as is frequently the case with inexperienced hands, who do not know any better, and occasionally who don't think. Some are honest enough

to tell you so, as I have frequently heard them say, "I don't think." I do appreciate their honesty, although it is a trifle annoying to those holding responsible positions.

Frayed Fabric.

Having completed the first coat of dope, the next thing to do is to obtain the frayed fabric or "spaced" fabric from the stores. This is ordinary fabric of ordinary width, in which the threads called the "weft," namely, those which run longitudinally in the fabric, are left out about every two inches for a width of about half an inch. This is cut into strips and laid on over the rib-stringing and well doped down, also strips are laid along the edges for the purpose of strengthening the fabric and preventing it tearing.

The method of attaching this frayed fabric is to dope the surface well and take a length with both hands. Lay it against the dope surface, or on it, and then rub it well down, either with the fingers or a piece of fabric. Then well dope over it with a brush.

When this has well set, the final coats of dope may be applied.

Identification Marks.

The next thing to do is to set out the identification mark according to the instructions and official measurements given; this is painted on by a painter with some experience in sign-writing or fine work.

When this is dry the "kahki" pigment is put on the top of the wing. Generally two coats are necessary. This being dry, the wing is turned over and given the final coats of varnish and left to dry.

When dry the wings, with the ailerons and the tail plane, the elevators, fin and rudder, which have been doped, will be taken to the finishing shop to have the external fittings attached.

(To be continued.)

THE PRODUCTION OF AEROPLANES.

Sir,—While appreciating your footnote that Mr. Stepney Blakeney's articles on "The Production of Aeroplanes and their Components" are of a somewhat elementary nature, may I be permitted to slightly criticise some parts of his thirteenth instalment. The author in detailing his method of machining tail-skid fittings commences his operations by the stamping to the marking-table, afterwards centring, then turning down to dimensions on drawing.

The tail-skid fittings are stampings, hence they will be sufficiently uniform to be chucked in the lathe without marking-off, and have both outside diameters and inside bores finished in one operation, thus saving centring and the time and jig for boring as a separate operation. By this method you will also be sure of having your inside and outside diameters concentric, which I venture to say is almost impossible on the jig Mr. Blakeney shows for boring without accurate fitting of the outside profile.

Again, would it not be better to have the double-eye end of the skid-fitting stamped out, thereby reducing the amount of metal to be removed and lessening the work your cutters have to do? The dies could be made this way with very little extra work. Mr. Blakeney also states the cutters should be well tightened up to prevent them slipping; would not the cutting of a keyway in the cutters be a better method? I would suggest that the stampings should be drilled before the edges are milled, the holes could then be used for a mandrel and N.G.S. template, the stamping being placed on the mandrel and milled to template on profiling machine or revolving-table.

Newcastle-on-Tyne, Sept. 27th, 1917. (Signed) T. Welsh.

Mr. Blakeney's Reply.

Sir,—In reply to Mr. T. Welsh's criticism, I regret I cannot agree that stampings are uniform, as it is no uncommon thing amongst them to find a few that require special adjustment in machining to enable them to be utilised, hence the precaution of sending same to the marking-off table.

With regard to fork-ends being solid, as assumed by Mr. T. Welsh, I think he will generally find, if he examines these stampings, that the fork-ends are stamped out as he proposes. I don't remember having seen a solid one.—S. B.

A NEW DOPE WORKS.

The new London works of the British Aeroplane Varnish Co., Ltd., at Booth Road, Colin Deep Lane, Hendon, N.W.9, are now in full swing. The works are under the management of Dr. P. Ewart Bowles, and Mr. E. Gordon Davies, F.I.C., is the chief chemist. Orders for Titanine and other materials used in connection with Titanine doping schemes can now be delivered promptly throughout the South of England by road or rail. The firm's extensive works at Felling-on-Tyne continue to supply orders required in Northern counties.

One views the progress of Titanine with all the more satisfaction when one remembers that the British Aeroplane Varnish Co., Ltd., was the pioneer firm for the manufacture of dopes which do not dope the workers. The importance of this point was kept by them before the authorities, despite adverse prejudice, and at the present time no aeroplane varnish is employed by the Government whose ingredients are a menace to human life.

THE AMERICAN "LIBERTY" ENGINE.

The successful completion of the U.S.A. or Liberty aircraft engine was announced in an official statement issued by the Secretary of War on August 12th. The statement reads:

"The United States aviation engine has passed its final tests. They were successful and gratifying. The new engine, designated by the Signal Service as the 'Liberty engine,' is now the main reliance of the United States in the rapid production in large numbers of high-powered battle planes for service in the war. In power, speed, serviceability and minimum weight the new engine invites comparison with the best that the European war has produced.

"I regard the invention and rapid development of this engine as one of the really big accomplishments of the United States since its entry into the war. The engine was brought about through the co-operation of more than a score of engineers, who pooled their skill and trade secrets in the war emergency, working with the encouragement of the Aircraft Production Board, the War Department and the Bureau of Standards.

"The story of the production of this engine is a remarkable one. Probably the war has produced no greater single achievement.

"One of the first problems which confronted the War Department and the Aircraft Production Board after the declaration of hostilities was to produce a dependable engine. Two courses were open. One was to encourage manufacturers to develop their own types, the other to bring the best of all types together and develop a standard.

"The necessity for speed and quantity of production resulted in a choice of the latter course, and a standard engine became our engineering objective.

"Two of the best engineers in the country, who had never before seen each other, were brought together at Washington, and the problem of producing an all-American engine at the earliest possible moment was presented to them. Their first conference, on June 3rd, lasted from the afternoon until half-past two o'clock in the morning.

"These two engineers were figuratively locked in a room in a Washington hotel and charged with the development of an aeroplane engine for use by Amercian aviators over the battle-fields of Europe. For five days neither man left the suite of rooms engaged for them. Consulting engineers and draughtsmen from various sections of the country were brought to Washington to assist them. The work in the draughting room proceeded continuously, day and night. Each of the two engineers in immediate charge of engine development alternately worked a twenty-four hour shift.

"An inspiring feature of this work was the aid rendered by consulting engineers and motor manufacturers, who gave up their trade secrets under the emergency of war needs. Realising that the new design would be a Government design and no firm or individual would reap selfish benefit because of its making, the motor manufacturers patriotically revealed their trade secrets and made available trade processes of great commercial value. These industries have also contributed the services of approximately 200 of their best draughtsmen.

"The two engineers locked together in a hotel room in this city promised the Government, if given an opportunity, they would design a satisfactory aero-engine before a working model could be brought from Europe.

"A remarkable American engine was actually produced three weeks before any model could have been brought from Europe. It was promised that this engine would be developed before the Fourth of July. Twenty-eight days after the drawings were started the new engine was set up. This was on July 3rd.

"In order to have the engine in Washington and in actual running order at the nation's capital on Independence Day the perfected engine was sent from a Western city in a special express car. The journey was made in twenty-one hours, and four young men guarded the engine en route to Washington and personally attended to its transfer from one railroad to another.

"With the need for speed as an incentive, tools for building the first engine were made even before the drawings were finished—on the assumption that they would be correct.

"Parts of the first engine were turned out at twelve different factories, located all the way from Connecticut to California. When the parts were assembled the adjustment was perfect and the performance of the engine was wonderfully gratifying. This in itself demonstrated the capabilities of American factories when put to the test and when thoroughly organised for emergency work of this sort.

"One of the chief rules outlined at the beginning of the designing work was that no engineer should be permitted to introduce construction which had not been tried out. There was no time for theorising. The new engine is successful because it embodies the best thought of engineering experience to date. Not only did this country furnish ideas through celebrated consulting engineers, but the representatives in the United States, of England, France and Italy co-operated in the development of this motor

"Thirty days after the assembling of the first engine preliminary tests justified the Government in formally accepting the engine as the best aircraft engine produced in any country. The final tests confirmed our faith in the new engine in every degree.

"Both the flying and altitude tests of the new engine have been gratifying. One test was conducted at Pike's Peak, where the United States aviation engine performed satisfactorily at this high altitude. One of the engines in an aeroplane broke the American altitude record in a recent flying test.

"While it is not deemed expedient to discuss in detail the performances and mechanics of the new engine, it may be said that standardisation is a chief factor in the development of the Government's engine. Cylinders, pistons and every other part of the engine have been standardised. They may be produced rapidly and economically by a great many factories operating under Government contracts. They may be as rapidly assembled, either by these plants or at a central assembly plant.

"The new engine amounts practically to an international model. It embodies the best there is in American engineering and the best features of European models, so far as it has been possible to adapt the latter to American manufacturing methods.

"The two engineers most directly connected with the production of the United States aviation engine had before them not only the blueprints and models of the most successful engines the war has produced, but also every available American suggestion. Men skilled in the invention of motors, both automobile and aeroplane, advised these engineers, who were charged with the duty of providing rapidly and unerringly an engine which would embody every essential of war-time use. Non-essential complexities were consistently discarded by these engineers. The result was a composite design of maximum power, minimum weight, great speed capability and adaptability to quick production.

"The standardisation of parts materially simplifies the problem of repair and maintenance. Spare parts will be promptly available at all times. Even the cylinders are designed separately. It is possible to build the new engine in four models, ranging from four to twelve cylinders, and under the standardisation plan now worked out an eight-cylinder or a twelve-cylinder model can be made, using the same standard cylinders, pistons, valves, cam shafts, and so on.

"With the completion of final tests of the engine—tests which satisfied and gratified both expert engineers and army officers—progress already has been made toward organising industry for the manufacture of the new machines and deliveries will begin within a comparatively short time."

MR. LOENING AT HOME.

Mr. Grover C. Loening, who is well and favourably known to most people concerned with aeronautics in this country, has, on his return to the States found that his practice as a Consulting Engineer has grown to such an extent that he has been compelled to incorporate it under the name of the Loening Aeronautical Engineering Corporation. The address of the new firm is 60, Wall Street, New York, and Mr. Loening has established quite extensive workshops in Long Island City, where he is engaged in constructional developments in connection with the United States Government.

Those who look forward to valuable assistance in aerial warfare from the United States will be glad to note that so capable an aeronautical engineer as Mr. Loening is appreciated at something like his real worth in his own country, and one feels confident that the work on which he is at present engaged will have considerable effect in promoting the efficiency of American aircraft in general.

TWO NEW AMERICAN AERONAUTICAL PAPERS.

The proprietors of "Aviation" and "Aeronautical Engineering," the Gardner Moffat Co., Inc., 120w, 32nd Street, New York, have issued a new weekly called "Air Service Journal," the first number of which appeared on July 12th.

According to the foreword in the first issue, the purpose of this journal is to give "as completely as war conditions will permit all the news of the Army and Navy Air Service."

The "Air Service Journal" contains a fund of information about military and naval training, together with official orders and other information of a purely service character.

The price of the new weekly is 10 cents, or four dollars per annum, foreign postage.

A new monthly, called "Air Travel," has been produced by the Air Travel Corporation, of 280, Madison Avenue, N.Y. The title of this magazine explains itself, and, as a means of popularising aviation, it may serve its purpose.

"Air Travel" combines news with fiction and flying gossip, and as it is certainly the best-printed aeronautical paper in America, the inspection of a specimen copy may be worth while. The price is 25 cents, and the foreign subscription is 3.50 dols.

ITALIAN TRADE NOTES.

Dr. Lawrence Santoni has been elected the first President of a newly-appointed aero-section of the Society for Promoting Italian Industries, called the Scientific and Technical Committee.

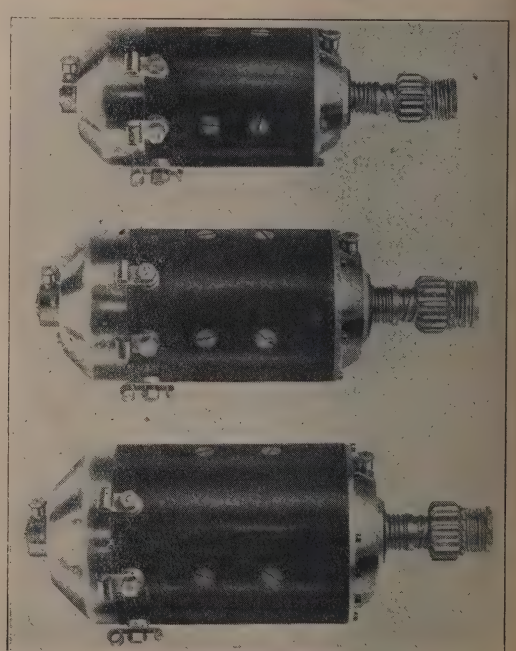
This aero section looks as if it might overlap the offices of the Syndicate of Aircraft Industries, which roughly corresponds to the S.B.A.C. However, everyone seems to belong to it, and the A.S. being introduced to the world by the National Aerial League hand in hand with the Syndicate, no doubt everything is for the most possible best. A grand national aeronautical council, formed of all three bodies, is aimed at too.

I feel safe in prophecying that we shall all be very astonished when certain matters relating to the L.T.A. raids of the recent communiqués is allowed to be spoken of. Will a Caproni be the first flying machine to fly to Europe from the States?—T. S. Harvey.

PROPELLER FINISHING.

Naylor Brothers (London), Ltd., of Southall, Middlesex, have issued a war-card setting forth a finishing scheme for airscrews, which has received A.I.D. approval. It would not be advisable to describe in print the exact procedure recommended, as it would be of value to the enemy, but aircraft constructors, who are concerned with the making and finishing of propellers, are invited to apply for copies to the firm's London office at 107 and 409, Oxford Street, London, W.1.

AIRCRAFT WORKERS' WAGES.



Negotiations for fixing conditions of employment in the aircraft industry are making appreciable progress. An agreement has been reached regarding the maximum week, overtime rates, and other matters, but some difficulties have arisen with reference to the minimum rate. The Air Board and the employers are stated to be in favour of a district minimum rate instead of a national minimum rate, as advocated by the National Aircraft Committee.

VANDERVELL PROGRESS.

That very progressive firm, C. A. Vandervell and Co., Ltd., has just introduced a new electric starter which is one of the lightest for its power yet produced in this country. It belongs to the gear type, which type is possessed of several advantages, being lighter, cheaper, and more efficient than the friction-drive type. The pinion is drawn very slowly into mesh with the spur wheel by means of magnetic influence, a quick thread on the armature shaft bringing it fully into mesh.

It is manufactured in three sizes, the smallest being of sufficient power to start an engine up to 16-h.p., the second size being powerful enough for an engine up to 40-h.p., and the largest size for anything over 40-h.p.

The machines are very simple to operate and appear to possess such workmanship as one would expect from the C.A.V.

Three sizes of the new C.A.V. Self-starter.

MARKET REPORTS.

Prices given are for quantities on usual terms.

COPPER.—Although the U.S. authorities fixed the price of Copper during last month, September closed with the far more important matter of labour troubles unsettled. The steady consumption is rapidly increasing, huge quantities, in addition to the colossal orders already on the books, having been ordered at the official figure of 23⅜ cents. The accumulated stocks have, however, decreased to a very low level and there appears to be every indication of a very serious Copper shortage. One understands there nearly one-third of the copper producers are on strike and there only appears to be a very remote chance of an early settlement of the dispute.

The price fixed by the American authorities has eliminated the open market, and, seeing that the price will remain unchanged for four months, consumers are, as stated above, already covering their future requirements.

Upon reference to the Prices Current List it will be observed that in consequence of a reduction in Copper Ingot the prices of Copper and Brass Tubes, Wire, etc., have adjusted themselves.

Supplies here are very satisfactory, and in view of the U.S. labour position the Ministry of Munitions are certainly pursuing a wise course in continuing to increase the list of parts, fittings, etc., which must be made of Steel instead of Copper.

Comparative Prices.

To-day	£110 per ton.
Last Month	£120 per ton.
Last Year	£118 10s. per ton.
Highest Price, 1916	£153 per ton.
Average Price, 1916	£116 per ton.

TIN.—During the past month the Tin market has still maintained an unsettled condition, prices having at one time declined to £241 and then soared again to £247 10s., the highest price since the beginning of August. There appears to be some doubt about large shipments arriving and in consequence it is expected that the market will not become much easier.

Comparative Prices.

To-day	£244 10 0
September 27th	£245 15 0
September 24th	£247 10 0
September 20th	£243 0 0
Highest Price, 1916	£205 0 0
Average Price, 1916	£182 0 0

LEAD.—There is very little to report this week, the strict control having eliminated ordinary business. The collection of Scrap should bring good results, but so would other things if they had not been in the hands of officialdom, so one must await results before relying upon it.

STEEL.—The most important news this week is the big reductions in the prices of American Steel. This, of course, will not directly affect the output of Aircraft Steels; if, however, it is found possible to place large contracts with U.S.A., the Air Board should then be able to put a few more works on the production of billets for the special Steel required for Aircraft use.

The prices are not as low as the official prices fixed here, but they are certainly not unreasonable, and increase the possibility of business now being done.

The Air Board is now exercising rigid control of all Aircraft Steels and firms will not now accept orders unless they have first been sanctioned by the A.B.

One has heard of several instances of unreasonable delay having taken place, but does not wish to be hasty in criticism, and reserves it for a future occasion.

After much delay some of the official A.B. prices have now been fixed, and will be found in the Prices Current List.

TIMBER.—One learns that in addition to the wood mentioned in last week's report, it has been decided to use another wood as a substitute for Silver Spruce, but for obvious reasons one refrains from mentioning its name.

One is pleased to observe that a few nice shipments of Walnut and Mahogany were received last week, at the same time one must not lose sight of the ever increasing demand, which is very much greater than the available supplies of suitable wood.

One is astonished to find that, although the Controller of Timber supplies requisitioned all stocks of Mahogany over a month ago, several firms have not yet had their stocks examined. They are, therefore, unable to do anything with the wood, as they do not know whether it will be taken by the Government inspectors.

It is impossible to procure supplies of Silver Spruce, and it is expected that there will be a big rush for the substitutes immediately supplies are available.

FABRIC.—One is concerned that the Irish labour dispute is still unsettled. One is informed that two representatives of the Government are on the spot endeavouring to effect a settlement, but so far no visible signs of a resumption can be seen. The position becomes very critical indeed, as the stocks held by constructors are rapidly diminishing, and production has practically ceased. It will, therefore, be observed that the outlook is very black indeed.

CURRENT MARKET PRICES.

Oct. 6th, 1917.

The prices given below are the prices ruling on the above date.

Terms.—Usual for the various materials mentioned.

Prices of old metals are as quoted by scrap dealers.

Prices must not be taken as specific quotations for definite quantities delivered to any part of the country.

Aluminium.	
Ingot	£225 per ton.
Remelted	£210 per ton.
Brass.	
Sheets	15⅜d. per lb.
Strip	14⅜d. per lb.
Wire	14⅜d. per lb.
Tubes	16d. per lb.
Castings	15d. per lb.

Specification S8 (bright-drawn),	£112	£112

STILL MORE PROOF

Dear Sirs,—Please find enclosed one pair of Triplex Goggles, which were broken yesterday, when I had the misfortune of crashing a fast experimental machine.

You will be pleased to hear that **Triplex saved my eyes** from being badly cut, and will be also interested to learn that the **Triplex windscreen was unbroken,** though the immediate surroundings were battered.

Faithfully yours,
Signed.....

MOTOR ACCESSORIES.

Those concerned with the Aircraft Industry who are interested in cars and motor-cycles, are recommended to apply for the pocket catalogue issued by Brown Bros., Ltd., of Great Eastern Street, London, E.C., of accessories and tools connected with the use of these vehicles. Despite its compactness the catalogue contains over 500 pages and some thousands of illustrations so the possession of a copy is very well worth while.

Naturally advancing prices make some of the charges shown in the catalogue inaccurate, but this does not detract from the value of the catalogue as a means whereby articles may be selected and ordered, and one is confident that the prices charged are as low as the costly nature of both material and workmanship will permit.

The catalogue will be sent to anyone who applies, enclosing four stamps in payment of postage.

CONVERTING AMERICA.

"Pall Mall Gazette" of Sept. 27th says:—

The repeated air raids on London, coupled with the fact that French and Italian cities seem by comparison to be immune, though much more accessible, are distinctly hurtful to British prestige here (says the "Daily Mail" New York correspondent).

Englishmen are asked continually by Americans, "When are you going to stop those brutes from coming to London?" or "When are you going to hit back?"

Italian flying machines and aviators are now in the United States in considerable numbers, and the impression is general that so far as the air is concerned, Great Britain ranks rather a bad fourth, France being first, Germany second, and Italy third.

[As a matter of fact it is probably Germany first, Great Britain second, France third, and Italy fourth, but perhaps the erroneous view obtained by the Americans may convince our official people of the benefit of sending to the States a few really capable representatives and two or three of our best aeroplanes such as our young flying officers crash daily with such complete nonchalance. Perhaps the Americans would then change their views as to what country makes the best aeroplanes, both as regards performances and quantities.—Ed.]

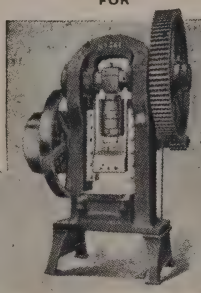
A VISTA OF DOPE TINS.—A consignment of Cellon Dope manufactured and ready for delivery within 36 hours of the order being received over the telephone.

RAPID DESPATCH.—R.F.C. Lorries taking away the dope illustrated above.

A REGENT STREET SALE.

The majority of the readers of The Aeroplane are probably more familiar with the naval and military outfitting department of Robinson and Cleaver, Ltd., than with their linen department, which is really the most important side of the firm's business; nevertheless, most readers have feminine belongings to whom such a department is of prime interest.

The autumn white sale has now commenced, and many bargains are to be had. A speciality is being made of Irish linens, and many pieces are being offered at prices 5s. to 6s. 8d. in the £1 below current rates.



Feminine readers of The Aeroplane especially will find much to interest them at Robinson and Cleaver's, and an illustrated catalogue may be obtained upon application to Robinson and Cleaver, Ltd., Regent Street, W.

Abridgments of recently published Specifications.

108,364. Parachutes. Croxton, W., 16, Cassimer Terrace, Clapton, London. August 9th, 1916, No. 11226. [Class 4.]

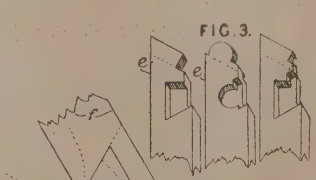
To facilitate the opening of a parachute for use with aircraft, an annular "curtain" A of silk, linen, india-rubber etc., is attached to the periphery of the parachute A^1 and is connected by lines C to thimbles B sliding on the main lines D, which are secured to the periphery of the body A^1. The curtain does not support any weight until the thimbles B engage stops on the lines D. In a modification, the main lines D are attached to a band fitted round inside the parachute, the periphery of which is then connected by the lines C to the thimbles B. A flap valve may be fitted at the apex of the parachute. The container for the parachute is preferably of streamline shape, and may be formed on two spring-hinged parts, so that the whole parachute is presented to the air when a catch is released.

FIG. 3

108,383. Screw Propellers. Smith, A. E., 18, St. James' Road, Kingston-on-Thames. Sept. 12th, 1916, No. 12875. [Class 114.]

The hub joints for laminated propellers are arranged so that the centre lines of the laminæ pass to one side of the centre of the hub and by their intersections form an equilateral triangle or square surrounding the centre of the hub. The end of each lamina is reduced to engage a recess cut in the side of another of the same set, all such recesses being on one side of each lamination so that all the laminæ in each layer mutually support one another to resist the thrust. In the example shown in Fig. 1, the ends *g* of the laminæ *f* are recessed into the sides *e* representing the leading edges. Fig. 3 shows three modifications for the cuttings for the joints. A central space may be left adapted to receive the hub bush or a wire-spoked wheel forming the centre of the propeller.

FIG. 3.



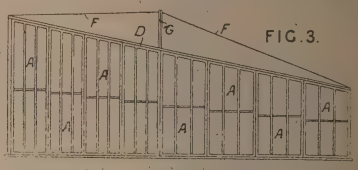


FIG. 1.

108,405. Aeroplane Hangars. Robinson, P., 2, Albion Place, and Airey, E., Cleveland House, Springwood Road, Roundhay, both in Leeds. Oct. 23rd, 1916, No. 15026. [Class 20 (i).]

The hangar is T-shaped in plan and slopes gradually from front to back, thus following in general outline the form of the aeroplane. The walls and roof consist of light timber-framed and creosoted leaves or sections A bolted or clamped together so that the hangar can be taken down and re-erected elsewhere. The lintel is formed of two or more beams jointed by means of fish-plates and bolts and is supported by cantilever beams D running from front to back over opposite sides of the rear or central bay and bolted to the lintel by means of steel cleats. The beams D serve to stiffen and bind the whole building together. Ring posts G, carrying ropes F which can be tightened, prevent the lintel from sagging. The walls and roof may be covered with canvas or other light material and the front may be fitted with waterproof canvas curtains, or with collapsible doors.

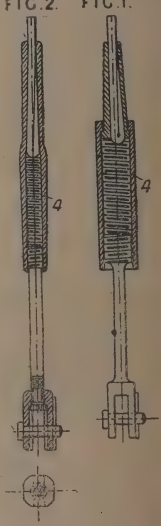

FIG. 3.

108,423. Connecting Wires to Strainers, etc. Quaglia, G., 66, Corso Vittorio Emanuele, and Capello, A., 66, Via Montevecchio, both in Turin, Italy. Dec. 22nd, 1916, No. 18426. Convention date, Aug. 26th, 1916. [Classes 45, 99 (i), and 109.]

Wires, such as aeroplane stay wires, are connected to hooks, straining-devices, etc., by flattening the end of the wire, bending it over to form a wedge-shaped end and inserting it in a tapered hole in the connecting member. In the form shown in Fig. 1, the tapered hole is formed in a socket swivelling in an internally-threaded straining-sleeve 4 in such a manner that one side of the hole is parallel to the centre line of the wire, the other side only being tapered. In a modification, the socket and sleeve are made in one piece, as shown in Fig. 2, a tapered hole for the reception of the wire being first formed therein and the sleeve then compressed on two sides. In both forms, the sleeve is screwed in one direction only.

FIG. 2. FIG. 1.

BARIMAR UBIQUITY.

Constantly extending the range of their activities in the field of scientific welding, Messrs. Barimar, Ltd., announce that their works to-day offer greater facilities than ever for all kinds of metal fusion, the processes now in operation including the well-known Barimar metallurgical system, oxy-acetylene, oxy-hydrogen, and electric welding and brazing. The fact is well known that not all processes are equally applicable to all metals, and Barimar, Ltd., claim that as one or other of their systems is adaptable to every known metallic combination, their range of usefulness to the machinery user is the most comprehensive in the world. There is nothing in the way of a breakdown that cannot be quickly and economically dealt with by the Barimar experts at 10, Poland Street, Oxford Street, W.1.

B. AND P. MOVEMENTS.

Owing to an error in transcription it was made to appear in last week's Aeroplane that Mr. Edouard Boudot, late of the North British Diesel Engine Works, Ltd., Glasgow, had been appointed chief buyer of Boulton and Paul, Ltd. As a matter of fact, Mr. Boudot has been appointed chief draughtsman of the technical department of this famous firm. The new chief buyer at Boulton and Paul, Ltd., is Mr. E. M. Hood, who has had very considerable experience of this class of work.

AIRCRAFT FINANCE

CURRENT TOPICS.

Limited Liability under the Company Acts.

Replying to a correspondent who adopts the appropriate nom-de-plume of "Lex-luminæ," asking for specific details and information as to the benefits of working a business as a private company under the Limited Liability Acts, and the necessary formalities, I set out the information in detail in these columns, as I feel that it will be of interest to a very large number interested in the aeroplane industry.

It is a well-recognised fact that, owing to the safe and equitable principles which constitute the bases of the Limited Liability Laws in this country, our system of trading, producing, manufacturing, and distributing has of late years undergone a great and progressive revolution. Limited liability has the primary advantage of limiting one's personal liability and protecting one's personal property. It permits the allocation of varying interests, and it facilitates the securing of any additional capital if and when required, for development or extension of business.

Commercial men recognise that limited liability is the only safe method of trading, for two important reasons: firstly, the person investing can receive a given number of shares equal in face value to the amount of money put into the business; he is thus assured of receiving his proper proportion of the profits, and no dispute can possibly arise in that respect; secondly, he is secure in the knowledge that his liability is absolutely limited to the amount of his share interest, which means, in plain English, that, should the undertaking in question prove a failure owing to bad trade, keen competition, or for some other cognate reason, the loss in connection with it cannot exceed the actual capital invested, whereas were the undertaking in question a private trading firm, not protected under the Joint Stock Companies Acts, and, should failure ensue, the partners in such an event would be jointly or severally liable to the creditors out of their private estates for the amount of the difference between the sum realised by the assets when disposed of, and that representing the total liabilities of the partnership.

The security in and advantages of investing under limited liability are thus obviously apparent. Many companies are formed solely for the purpose of placing the proprietors in a position to raise, as and when required, additional working capital to cope with the increase in trade.

Investors taking up shares in one or other of these companies become, to all intents and purposes, limited partners in that particular business, and receive their due proportion of profit just as they would were they trading as an ordinary private partnership concern, and also (which is the main point to be considered) absolutely limit their liability to the nominal amount of the shares they hold, although the amount of profit which may be derived by way of dividends or bonus on their shares is unlimited. Investors, large and small, recognise and appreciate the safety of the handsome returns realisable from and the great security attached to share investments in substantial private limited liability companies.

It must be borne in mind that it is illegal for any partnership or association consisting of more than twenty members to carry on any trading concern, and that such a partnership or association is required to be registered as a limited company. The association or partnership of more than twenty individuals, whether trading as a company or otherwise, cannot sue in law, but can be sued; and, further, all officials are liable to penalties for every day that business continues to be carried on through any association, group, or partnership consisting of more than twenty members.

The partnership or association, therefore, to become a private company, should be registered as a limited company under the Companies (Consolidation) Act of 1908, and such a company limited to 50 members (exclusive of persons in the employment of the company) is a private company, and by its articles of association prohibits any invitation to the public to subscribe for shares, and restricts the right of transfer of its own shares.

The advantages of trading under limited liability, as against the risks of an unlimited partnership, both to large and small traders as well as investors and capitalists, are numerous.

Income Tax Regulations.

A White Paper was recently issued by the Chancellor of the Exchequer dealing with the vexed question of the valuation of stocks, allowances for wear and tear, depreciation and obsolescence of assets, for the purpose of excess profits duties. This new Government regulation has been framed with the object of guiding the Board of Inland Revenue, and is of particular interest to the aircraft industry.

The regulations are framed by the Committee of Consulting Accountants, acting as advisers to the Ministry of Munitions. This committee emphatically states that there is only one sound general principle for the valuation of stocks, and making the requisite depreciation of wasting assets, and there is no doubt that every chartered accountant will adopt the principle in dealing with these questions in the future framing of balance-sheets.

Directors, managers, and other officials of limited companies would, therefore, do well to take careful note of this new regulation.

The Bleriot Manufacturing Aircraft Company, Limited, (In Liquidation).

All interested in the aircraft industry will recall the flotation of this company in June, 1915, which was made with "Treasury consent," and many will have followed the subsequent proceedings resulting in the company passing into the hands of the Official Receiver. Rumours of every kind, from a number of sources, have been rife, and much concerning the company has been "wropt in mystery."

I received a notice emanating from a well-known firm of solicitors convening a meeting of shareholders to be held at the Cannon Street Hotel last week, and I resolved to, and did, attend the meeting with the object

of obtaining, as far as was possible, the fullest information concerning this flotation, for the benefit of the readers of this article. I consider that the whole industry has an important capital interest to safeguard in connection with public investment in the aircraft industry, and I feel one has an important moral obligation and a duty to the public to investigate everything having any connection with the finance of the industry.

The meeting was convened by Messrs. Amery Parkes & Co., the well-known solicitors, and Mr. Harry J. Lawson occupied the chair. Mr. Lawson explained to the meeting the inception and history of the flotation of this company in great detail. He stated that M. Blériot, after much negotiation, entered into a contract with the Army & Navy Syndicate, Ltd., of which he (Mr. Lawson) was managing director, for the purchase of the Blériot business for the sum of £28,000 in cash, plus one-quarter interest in the company to be formed, and was paid a certain cash deposit as provided for in the said contract.

The negotiations between the Army & Navy Syndicate, Ltd., and M. Blériot were carried out by Mr. William A. Casson, barrister-at-law, who acted as intermediary. The "subscription list" to the flotation was opened to the public on Thursday, June 24th, 1915, and closed on the following Monday, during which time M. Blériot attended the offices of the company and assisted in the details of the flotation. The result of the public issue was that over a thousand investors applied and were allotted shares, the result being that the capital was over-subscribed.

The directors thereupon convened a meeting to complete the contract with M. Blériot, which Mr. Casson attended and notified the directors that M. Blériot had returned to France and refused to proceed and carry out the transfer of his business to the company. A writ was immediately issued by the promoting syndicate against M. Blériot for "specific performance." This proceeding was rendered abortive by a petition being presented by a shareholder to the Courts to wind up the company.

It is alleged by Mr. Lawson that the petitioner was a man of straw, holding shares paid for by Mr. Casson, and that M. Blériot and Mr. Casson had together conspired and induced him to file the petition (which it is alleged contained many false statements) with the specific object of thus evading their legal obligations.

At this stage Mr. Lawson explained that he was incapacitated for some months, in consequence of injuries he sustained on the "Sussex" when that vessel was torpedoed in the Channel, and he went on to relate that at this period Mr. Casson entered an action against him for libel. The result of the trial was a verdict in Mr. Lawson's favour, given without the jury leaving the box.

In the course of this action the Blériot matter was reviewed. Mr. Lawson, acting as his own counsel, cross-examined Mr. Casson, when Mr. Casson was compelled to admit that the contract entered into with his principal, M. Blériot, was perfectly in order, and that the prospectus was legal and correct in every detail. Fortified by the admissions made by Mr. Casson, Mr. Lawson was prepared to take a certain course of action, when suddenly Mr. Casson was arrested under another charge, the details of which are now public property.

Mr. Lawson went on to point out that, but for the winding up of the company, M. Blériot would have been compelled to complete the transfer of the business. I am given to understand that the Official Receiver is now suing M. Blériot for £118,000, a sum which one must therefore consider is the amount this official estimates will be the sum due to the shareholders.

Mr. Lawson went on to state that he had consulted eminent counsel, and was informed that under the Companies Acts a "stay" of the liquidation proceedings could even now be obtained, providing a petition was lodged, properly supported by the shareholders, particularly in view of the fact that the company has no creditors against it.

This being done, it would be open to the company to proceed against M. Blériot for an account and return of the profits he had made, and to sue for "specific performance" of the contract. This meeting had been convened for the special purpose of appointing a committee of shareholders to confer with the solicitors and take the steps he had outlined on behalf of and in the interests of the shareholders of the company.

After some discussion on points of detail, a resolution to this effect was then proposed and seconded. The resolution was carried unanimously, and a committee of seven shareholders was immediately appointed. I understand this committee sat immediately after the meeting and subscribed a considerable guarantee fund. They then instructed Messrs. Amery Parkes & Co. to take the necessary legal steps forthwith to give effect to the views which had been expressed.

It does not fall within my province to judge; that is for the Courts; but I may say that never in the history of modern finance have I met such a remarkable story.

Whatever may be the legal and technical points, it appears "prima facie" that proper legal contracts were entered into by M. Blériot for the sale of his business, and the main point that interests one as guardian of the *moral* of aviation finance is that it is clear that if the business had been carried out the shareholders today would be receiving handsome profits.

One takes no interest in Mr. Lawson personally, nor is one concerned in whatever may be said for or against his personal reputation, as whatever view one may take of this gentleman, it is inconceivable that it can justify the course adopted by M. Blériot acting on a contract signed in this country. One should watch with a jealous eye the interests of the very numerous shareholders who have parted with their money in their desire to become investors in the aeroplane industry, and I shall again refer to this business as soon as there are further developments.

G. A.

THOSE Manufacturers of Aeroplanes and Aero Engines who have not yet obtained a copy of our Catalogue "Aircraft Fittings" will find it surprisingly helpful. Fully illustrated it makes a handy little reference. A copy will be sent on receipt of business note heading.

With the many contracts we have filled before and during the war period, our facilities for production have ever increased. To-day is never a measure of what we can do for you to-morrow.

We are prepared to give quotations at all times, but with the necessary reservation that orders will be dealt with in strict rotation.

THE ROTAX MOTOR ACCESSORIES Co., Ltd.

Willesden Junction, London, N.W.10.

Where Flying Men are fitted out.

PERFECT PROTECTION.

WEATHER with a 500-h.p. W.; that includes all the most vile things you can think of (and some unthinkable); that's the stuff from which Dunhill's outfits protect the airmen. And weather is weather whether you're doing "straights with instructor" or boast a gun-bus of your very own.

Equip yourself at Dunhill's—cruise out when you will and you'll find wind, rain and cold will bother you about as much as soap does a Laplander.

Dunhill's cut gives you the essential freedom of movement without detracting in any way from style. As speciality outfitters they date back from the "red flag" days of motoring. They were going strong when flying was more "in the air" than it is to-day, and now they are pre-eminent as specialists for airmen.

Everything in Dunhill's is the best for its purpose; the most reliable and the most durable, which means the most economical.

Tunic, in finest whipcord	£5 10s.
Breeches, best Bedford cord	£3 3s.
Leather Coats, made of finest chrome dressed skin, light in weight, soft to handle and fitting like a glove, lined with finest fleece	£9 9s.

A copy of our Catalogue will gladly be sent on request.

(*Continued from page 1024.*)

BARWELL.—Capt. Frederick Leycester Barwell, London Regt. and R.F.C., previously reported missing, now reported killed on April 29th last, aged 22 years, was the eldest son of Mr. and Mrs. Leycester Barwell, of The Tower, Ascot. On the outbreak of war he had just left Malvern College to enter Pembroke College, Cambridge, but at once enlisted in the Queen's Westminster Rifles, receiving his commission six weeks later. He went to France with his battalion on November 1st, 1914, and served there until August, 1915, when he had sick leave. He returned to the front in April, 1916, and in the following September was sent home slightly wounded. Last January he transferred to the R.F.C. He received his first flight, under instruction, on February 28th, and gained his pilot's certificate on April 9th, proceeding to the front on April 13th. He received his second star in April, 1915, and was promoted temporary captain on July 1st, 1916, and captain on April 28th last, the day before he was killed.

His Squadron Commander writes:—"We miss him awfully in the squadron, both as a pilot and in the mess. Although he had only been with us a very short time he was very popular indeed, and was already a very good pilot, and showed signs of becoming a brilliant one. He died one of the finest deaths in quite the finest way. Capt. Barwell was killed after a gallant fight of half an hour's duration with a number of enemy aeroplanes, which he attacked single-handed. He was buried by the enemy with military honours."

CHAPMAN.—Major Charles Meredith Bouverie Chapman (Squadron Commander), M.C., Chevalier de l'Ordre de Léopold, Lieut., "The Buffs," attached R.F.C., who died of wounds on Oct. 1st, was the eldest son of Mr. and Mrs. William C. N. Chapman, Heppington, Canterbury. He was 25 years of age.

FEATHERSTONE.—"Accidental death" was the verdict at a Westminster inquest on Oct. 4th on Sec. Lt. Walter Featherstone, R.F.C., aged 27, of North Lodge, Hatfield. Evidence showed that he, although still under training, recently performed flights by himself for 20 hours, and he went for a practice flight in Middlesex on Oct. 3rd. He "taxied" and then rose to a height of about 100 feet. Going up too steeply, the machine "stalled," pitched to the right in a "flat spin," and vertically nose-dived. Flames broke out, and he was terribly burned, having in addition a fractured ankle, sustained through being partially thrown out. He was removed to Eaton Square R.F.C. Hospital, where he died. Brother officers expressed the opinion that he lost his head on finding his difficult position.

FENWICK.—Sec. Lt. W. Cecil Fenwick, R.F.C., who was reported missing on Oct. 7th, 1916, now known to have been killed on that date in air fighting on the Somme, was the eldest son of Mr. and Mrs. C. F. Fenwick, of 3, Tring Avenue, Ealing. He was 19 years of age.

LOYD.—Capt. and Flt. Comdr. Alwyne Travers Loyd, The Buffs, attd. R.F.C. (killed in action on Sept. 28th), was third son of Mr. and Mrs. Llewellyn F. Loyd, of Lillesden, Hawkhurst, Kent. He was 23 years of age and was appointed Flt. Comdr. R.F.C. in November of last year.

MIALL-SMITH.—Lt. G. E. Miall-Smith, M.C., R.F.C. (formerly 8th Norfolk Regt.), who was killed while flying on Sept. 25th, was the only surviving son of G. A. and Mrs. Miall-Smith, Fern Lodge, Millfield Lane, Highgate, N. He was 22 years of age.

PEMBER.—Lt. Edward Horace Pember, R.F.A. and R.F.C., who was killed on Sept. 30th, aged 19, was the only surviving son of the Warden of All Souls College, Oxford. He was educated at Mr. L. T. Thring's School at Hove and at Harrow, where he was in Mr. A. Vassall's house. In 1910 he won an entrance classical scholarship at Harrow, and in 1914 he was elected to a mathematical exhibition at Balliol College, Oxford. At Harrow he was a member of the O.T.C., and in the school shooting eight in 1915.

He received his commission in the R.F.A. in July, 1915, went out to Suvla Bay in the following November, and, after the evacuation, was for some months in Egypt with his battery. In the autumn of 1916 he joined the R.F.C., and he had been flying at the front since the first week in May. On the morning of Sept. 30th he was flying over the enemy's lines taking photographs, when he was attacked by four enemy scout machines, who came down on him suddenly from a great height. His machine was brought down, and both he and his observer were killed instantly. He was buried on Oct. 1st.

RICHARDSON.—Lieut. William Richardson, R.F.C., has been killed in a flying accident in the south of England.

THORNTON and LEWIS.—An inquest was held in Warwickshire on Oct. 8th on the body of Sec. Lt. Thornton, R.F.C., who lost his life in an aeroplane accident on Oct. 5th. The evidence showed that the accident was due to an error of judgment on the part of the pilot, Sec. Lt. Lewis, R.F.C., who, thinking he was higher from the ground than was actually the case, attempted a left-hand turn at a height of 100 ft. In the fall Mr. Thornton, who was acting as observer, had his neck broken. A verdict of accidental death was returned. Mr. Lewis, who had several limbs broken, died on Oct. 8th.

TOMLIN.—Sec. Lt. Harry Francis Tomlin, R.F.C., who was killed in action on Sept. 28th; was the only son of Mr. and Mrs. H. T. Tomlin, "Nilmot," Madeira Place, Brighton. He was 20 years of age.

TOBIN-WILLIS.—Lt. Jack Tobin-Willis, R.F.C. (killed in action on August 17th), was the only son of Dr. and Mrs. Willis, also nephew of Dr. Tobin, of Ilkeston, Derbyshire, and grandson of the late James Tobin, of Tincurry House, Cahir, County Tipperary. He was 21 years of age, and was educated at St. Cuthbert's, Newcastle-on-Tyne, and afterwards by the Benedictines at Douai Abbey. He was a law student and an undergraduate of London University. Having got his commission in the A.S.C. he went to France in January, 1915, and was posted to a Cavalry division, whose fortunes and adventures he shared as supply officer, claims officer, mess president, and adjutant up to his volunteering for the R.F.C. This was about six months ago, when he came to Brooklands for his training as gunner and observer. He was quickly back in France again. Having won his wings he became more especially engaged in observations of German artillery. It is in record that he and his pilot, Lt. Sayers, accounted for two German aeroplanes on August 14th, but three days later the fortunes of war were reversed, and they both fought their last fight within sight of the great battlefield of Ypres.

WARD.—Major George Bernard Ward, M.C., R.F.C. (killed in action), was appointed Squadron Comdr. in Dec. last year. His award of the Military Cross was gazetted a month before for conspicuous gallantry in action. The official account stated that "he flew over the enemy's lines at a height of 1,000 ft. under heavy fire, and carried out a very successful artillery reconnaissance. He has previously done very fine work."

WELCH.—Lt. Hugh Welch, R.F.C., who was missing after an air fight on March 28th last, and is now reported killed on that date, was the eldest son of Mr. T. H. Welch, Ordnance Factories' Civil Staff. He was in his 21st year, and was educated at Lt. Chamberlain's School, Eltham, and Merchant Taylors' (1906-1912). He was with the Royal Exchange Assurance when the war broke out, and enlisted in the 2nd London Brigade, R.F.A., on August 10th, 1914, being commissioned the same month. He joined the R.F.C. in September, 1915, and served as observer at the front from October, 1915, to April, 1916, and as pilot from last December.

WORSTENHOLM.—Sec. Lt. John Worstenholm, R.F.C., only son of Mr. L. Worstenholm, editor of the "Northern Echo," Darlington, has been killed in action. Educated at Darlington Grammar School, he obtained two scholarships, and proceeded a year ago to Cambridge University. At Christmas, on attaining the age of 19 years, he joined the Artists Rifles, and four months later was transferred to the R.F.C. He had only been at the front for five weeks.

YOUNG.—Sec. Lieut. Harold Farquhar Young, Sherwood Foresters, attd. R.F.C., who was reported missing on Aug. 20th last, after a flight over the enemy lines, is now reported by a German newspaper to have died. He was the only son of Fred Young, Old Bank House, Burton-on-Trent, and was 19 years of age.

Engagements.

ADDINSELL—BLACK.—A marriage has been arranged, and will take place quietly on Saturday, October 13th (leave permitting), between Lt. Jack E. Addisell, Royal Munster Fusiliers and R.F.C., third son of Mr. and Mrs. W. Arthur Addinsell, of Harrow Weald Lodge, Middlesex, and Muriel, second daughter of Mr. and Mrs. R. J. Black, of 29, Wellington Court, S.W., and The Knipp, Chiddingfold, Surrey. The ceremony will be at St. Paul's, Knightsbridge, at 2.30. All friends will be welcome at the church, but there will be no reception.

DE ROEMER—LIDDELL.—A marriage is arranged between Capt. Charles William de Roemer, R.F.A., attached R.F.C., only son of Major and Mrs. de Roemer, Lime Park, Hurstmonceux, Sussex, and Audrey, eldest daughter of the late Charles Lyon Liddell and Mrs. Liddell, Place House, Peasmarsh, Sussex.

HODGES—CRACKNELL.—An engagement is announced between Capt. A. G. A. Hodges, Northampton Regt. and R.F.C., elder son of the Rev. H. A. and Mrs. Hodges, Barrow-on-Trent, Derby, and Margaret Enid, elder daughter of Mr. and Mrs. R. J. Cracknell, 61, Babington Road, Streatham, London, S.W.

LAMROCK—GERMAINE—The engagement is announced of Mr. C. R. Lamrock, R.F.C., son of the late Mr. S. C. Lamrock, Barrister, and Mrs. Grieve, of N.S. Wales, and Carrie Evelyn, elder daughter of the late Mr. R. A. Germaine, K.C., Recorder of Lichfield, and Mrs. Germaine, of 21, Philbeach Gardens, S.W.

Marriages.

ANGELL—MATHEWS.—On Oct. 2nd, at the Roman Catholic Church, Romford, Lt. Bruce O. Angell, R.F.C., only son of H. O. Angell, of Crichel, Wimborne, Dorset, was married

DO YOU WANT WELDING?

WE CAN UNDERTAKE ALMOST ANY AMOUNT FOR IMMEDIATE ATTENTION.

Your best plan would be to send it along to us ready spotted, but we can work it up from any stage, and can make up suitable Fixtures.

PRESSED WORK.—We have Four Presses (up to 70 tons) and an up-to-date Toolmaking Department. Inclusive prices for 500 Blanks and upwards.

to Doris, only daughter of W. G. K. Mathews, R.I.M.S., and Mrs. Mathews, of "Parvati," Gidea Park, Essex.

BERKELEY—CHARLES.—On Oct. 2nd, at St. Matthew's, Bayswater, Frank Charles Berkeley, R.F.C., only son of J. H. Astley Berkeley and Mrs. Berkeley, of Grenada, West Indies, was married to Amelia Flora Charles, second daughter of David Charles and Mrs. Charles, of Swansea.

BURNSIDE—HAMMOND.—On Sept. 28th, Lt. G. C. Burnside, R.F.C., of Glasgow, was married to Winifred, third daughter of Capt. and Mrs. Hammond, of Stopford Road, Upton Manor, Essex.

BUSH—EVANS.—On Sept. 22nd, at Emmanuel Church, Clifton, Graham Shurmur Bush, R.F.C., youngest son of Philip W. Bush and Mrs. Philip Bush, of the Old Manor House, Keynsham, was married to Leonora Brittan, daughter of H. Brittan Evans and Mrs. Brittan Evans, of 32, Pembroke Road, Clifton.

FOWLER—GREENE.—On Oct. 4th, at the Parish Church, Cirencester, Capt. R. Charles Fowler Northamptonshire Regt., attd. R.F.C., eldest son of the late Dr. O. H. Fowler, of Cirencester, was married to Ethel Mary, second daughter of Mr. and Mrs. Greene, of Moore House, Whalton, Northumberland, and Oakley Cottage, Cirencester.

GOSSAGE—O'BRIEN.—On Oct. 5th, 1917, at St. Margaret's Church, Buxted, Sussex, Maj. Ernest Leslie Gossage, M.C., R.F.A. and R.F.C., eldest son of Colonel E. F. Gossage, V.D., of Dorin Court, Uptonheath, Chester, was married to Eileen Gladys, only daughter of Brigadier-General E. O'Brien, C.B., late 14th Hussars, employed on active service, and Mrs. O'Brien, at the Rectory, Buxted, Sussex, by the Rev. G. S. Pownall, Rector of Buxted.

HALL—WELLS-COLE.—The marriage took place last week at Lincoln of Capt. G. H. Hall, Yeo. and R.F.C., eldest son of Sir Henry Hall, I.S.O., and Lady Hall, of Chester, and Miss M. G. Wells-Cole, younger daughter of the late G. F. Wells-Cole and Mrs. Wells-Cole, of Stones Place, Lincoln.

HARDY—DICKINSON.—On Monday, Oct. 1st, at St. Nicholas' Cathedral, Newcastle-upon-Tyne, Lt. G. P. U. Hardy, R.G.A. and R.F.C., only son of Mr. and Mrs. Paul Hardy, of The Cottage, Storrington, was married to Sophia Helena (Ena), younger daughter of Mr. and Mrs. A. H. Dickinson, of Eastfield, Gosforth, by the Rev. Canon Newsom.

KNIGHT-BRUCE—AVELING.—On Oct. 6th, at St. Stephen's Church, S.W., Capt. R. E. C. Knight-Bruce, Yeomanry and Royal Flying Corps, of the Sanctuary, Crediton, Devon, was married to Evelyn, elder daughter of Mrs. Neville Aveling, St. Germans Hall, Norfolk, by the Rev. Paul Cleave and the Rev. Lord Victor Seymour, Vicar of the Parish.

LITHGOW—BALFOUR.—On Oct. 2nd, at the Parish Church, Tetbury, Major Ernest Lithgow, R.A.M.C. and R.F.C., eldest son of Dr. Lithgow, of Farnborough, was married to Doris, elder daughter of Lieut.-Colonel A. M. Balfour, D.S.O., R.F.A., and Mrs. Balfour, of The Close, Tetbury, by the Rev. A. L. Whitfeld, Vicar of Hughenden, assisted by the Rev. W. Thomson, LL.D., Vicar.

MAITLAND—LEWIS.—The marriage between Francis E. Maitland, son of Mr. and Mrs. Thomas Maitland, of Reres Cottage, Broughty Ferry, and Margaret, widow of Lieut.-Colonel D. S. Lewis, D.S.O., R.E. and R.F.C., and daughter of Mr. and Mrs. Philip Williams, of The Malt House, West Woodhay, Newbury, took place at St. Dunstan's in the West, Fleet Street, at 2 o'clock on Saturday, October 6th.

SMITH—BIRKETT.—The marriage of the Hon. Hubert Constantine Smith, R.F.C., second son of Lord and Lady Colwyn, of Queen's Lodge, Colwyn Bay, and Miss Marjorie Methwold Birkett, daughter of Mr. and Mrs. Arthur Birkett, of 22, Warwick Gardens, W., took place at St. Mary Abbotts, Kensington, on Saturday. The Bishop of Lincoln officiated, assisted by the Rev. H. H. Lowe, vicar of St. Barnabas, Kensington, and the Rev. Herbert Allen, curate of the church.

SPEED—DERING.—The marriage of Capt. Douglas Speed, K.R.R.C. and R.F.C., son of Major and Mrs. Elmer Speed, and Miss Myrtle Dering, second daughter of Sir Henry and Lady Dering, took place at St. Paul's, Knightsbridge, on Oct. 4th. The ceremony was performed by the Rev. Dr. Springett, assisted by the Rev. S. G. H. Sargent, rector of Knowlton, Dover, and the Rev. H. F. Speed, uncle of the bridegroom.

THORNE—THURSBY.—On Oct. 3rd, at Castle Rising, Lt. Arthur Bussel Thorne, R.F.A., attd. R.F.C., second son of Capt. and Mrs. F. G. Thorne, of Heacham, Norfolk, was married to Katherine Gwentholen, eldest daughter of the Rev. and Mrs. H. E. Thursby, by the rector, father of the bride, assisted by the Rev. G. Ellerby, rector of Runcorn.

Births.

GOODE.—On Sept. 25th, at Lausanne, Switzerland, to the wife of Capt. H. M. Goode, R.F.C.—a daughter.

PRATT.—On Sept. 28th, at 38, Nevern Square, S.W., to Grace Marian, wife of Capt. G. B. Pratt, R.F.A. and R.F.C.—a daughter.

Lt. George Leal, R.F.C., son of Mr. George Leal, of Johannesburg, has been reported missing after flying on the Western Front. He went through the S.W.A. campaign with Col. Taylor. He is very well known in connection with the Transvaal Artillery Corps, and by profession is an accountant with Mr. F. W. Diamond, Johannesburg.

* * *

The special correspondent of the "Morning Post," writing from the British front on Oct. 5th, says:—

Aeroplanes and tanks did useful work in spite of the extremely unfavourable conditions during the fighting on Oct. 4th at Broodseinde Ridge. A strong wind forced the fastest machines to travel very slowly when beating against it, but some scouting work was done by skilful pilots, and they made low flights over the demoralised German infantry in the back areas. I heard of one aviator who kept aloft most of the morning over the German lines, absolutely ignoring the efforts to bring him down. He was fired at constantly by all kinds of guns and by the infantry in the shell-holes, but kept steadily on his way until his machine had been nearly shot to pieces. Finally, with wings riddled and holes in his petrol tank, but still unwounded himself, he made a forced descent, landing just within our lines. Though badly bruised and almost unrecognisable, and with a broken, swollen nose, he walked to headquarters, made his report, and to-day begged to be allowed to go out again instead of remaining in hospital. Some of the German aeroplanes which braved the gale were brought down by rifle and machine-gun fire from our lines. [So apparently the Germans were not less brave in attacking close to the ground.—Ed.]

FRANCE.

Official Communiqués.

Oct. 2nd.—German aeroplanes attacked again last night (Monday) the town of Dunkirk. The bombardment, which was very violent, caused serious material damage. It is reported that there were a number of victims among the civilian population.

In reprisal for the bombardments carried out by the Germans on Dunkirk and Bar-le-Duc, our aviators on the night of October 1st-2nd dropped bombs on the towns of Stuttgart, Trèves, Coblentz, and Frankfurt-on-Main.

In addition, our bombarding aircraft carried out numerous flights, in the course of which 2,120 kilograms (about two tons) of explosives were dropped on the depots at Roulers and 6,000 kilograms (about six tons) on the railway stations of Metz-Sud, Woippy (near Metz), and Thionville (17 miles north of Metz), the aerodrome at Chambley (14 miles west-south-west of Metz), the bivouacs of Spincourt (17 miles north-east of Verdun), and Tilly, and the dumps at Longeau Farm, where a violent explosion was observed.

During the day on October 1st two German aeroplanes were brought down by our pilots and four driven down out of control.

Last night German aeroplanes dropped bombs on Toul. Several casualties are reported.

Oct. 3rd.—Our bombing aeroplanes on the night of Oct. 1st-2nd and during the day yesterday (Tuesday) bombed the railway station of Freiburg (in Breisgau), the factories of Völklingen (north-west of Saarbrücken) and Hoftenbach, and the railway stations of Brieulles, Longuyon, Metz, Woippy, Arnaville (south-west of Metz,) Maizières-les-Metz, Thionville, and Saarburg. Seven thousand kilogrammes (nearly seven tons) of explosives were dropped during these various expeditions.

As a reprisal for the bombardment of Bar-le-Duc two of our aeroplanes dropped bombs on the town of Baden (which lies about 95 miles east of Nancy).

Oct. 4th.—As a reprisal for the bombardment of Bar-le-Duc our aircraft bombarded Frankfurt (about 150 miles north-east of Nancy) and Rastatt (about 90 miles east of Nancy).

Oct. 6th.—Army of the Orient.—Allied aeroplanes bombarded the enemy establishments north of Ghevgeli (Vardar) and near Resna (north of Lake Prespa).

Oct. 8th.—Army of the Orient.—In the region of Doiran two raids supported by aircraft penetrated the enemy's lines and destroyed various works.

* * *

According to an Elberfeld telegram to the "Cologne Gazette," Oct. 3rd, the aviator who shot down Capt. Guynemer was Flt. Lt. Wissemann, who himself has since been killed.

In his last letter to his parents, in which he described how he brought down Capt. Guynemer, Lt. Wissemann wrote:—"Do not be anxious, as I can never have a more dangerous enemy."

* * *

A message from Paris on Oct. 6th stated that during the month of August 84 flights were made by French naval airships and 3,087 by naval aeroplanes and seaplanes. Twelve attacks were made upon submarines, one during the night; there were four combats in the air, and six bombardments of enemy naval bases were carried out.

GERMANY.

Official Communiqués.

Oct. 2nd.—Last night London, Sheerness, Ramsgate, and Dover were once again attacked by our aviators.

the night of October 1st-2nd on London, Margate, Sheerness, and Dover, had a visibly good effect. Numerous bombs were also dropped with visible success on the English ports and principal points for traffic in Northern France.

Western Theatre of War.—In an aerial fight Lieut. Gontermann shot down his 39th opponent and First Lieut. Berthold his 28th.

Oct. 6th.—The stormy weather limited aerial activity. Five enemy aeroplanes were shot down. Lieut. Müller gained his 29th aerial victory.

Oct. 7th.—Photographs taken by our aviators confirm the conclusion that our bomb attacks on the fortress of Dunkirk caused great destruction in several quarters of the town, especially to the harbour, warehouses, and railway works. Considerable hindrance will have been caused thereby to the English reinforcements.

* * *

A Berlin telegram of Oct. 4th says:—

Enemy aviators during the night of October 2nd attempted in numerous flights to make attacks on German soil. The attacks did not produce results of any kind. An enemy aeroplane came as far as the neighbourhood of Stuttgart and dropped at Feuerbach six bombs, which caused small damage but no casualties. The open town of Frankfurt-on-Main was attacked by about ten aviators, who came from a southern and western direction. Most of the bombs fell without effect outside the town. Within the city boundary thirteen places have thus far been counted where bombs fell. The bombs were dropped mostly in streets and open places, and the damage was small. Five persons were slightly injured and nobody was killed. One of the enemy aviators who during the night of October 2nd attacked Frankfurt was on the return flight forced to descend by German anti-aircraft measures. He is a serjeant, and his machine was a Sopwith one-seater, No. 128.

The Lorraine industrial region was subjected to numerous attacks, which, however, as usual, thanks to our effective measures of defence, had only slight success. Only one enemy aviator again succeeded in penetrating into the region of Dortmund. He dropped on the railway at Dorstfeld (Dortmund South) six bombs which damaged the tracks In this attack one person was killed.

Some attacks during the night of October 2nd were also directed against Rastatt, Baden-Baden, and Tübingen. Three bombs were dropped on the first two places, causing some material damage. For what purpose the French make these attacks on open German towns is unclear. In Rastatt there are no military objectives, and the attacks on Tübingen and Baden-Baden can only be considered as the outcome of a blind desire for destruction.

The sanatoria at Baden-Baden and the hospitals at Tübingen contain numerous severely wounded men who are there seeking recovery. Even the French will not dare to assert that attacks on hospitals far behind the front are of military necessity. By such barbarity the will to persevere can only be strengthened in the German people.

* * *

The "Frankfurter Zeitung" reports that on Sept. 30th several enemy aviators flew over Frankfurt. They were heavily fired at by anti-aircraft guns. They dropped a considerable number of bombs on Frankfurt and the environs. In the town itself, according to present information, eighteen bombs were dropped, "causing slight damage and injuring five persons." The raid, which began at 10.30 p.m., ended at 11.35 p.m.

* * *

Serious labour trouble is reported at the aeroplane factories in the Berlin districts. Work has been stopped for ten days, some 40,000 workmen being involved. The reason for the strike is due to bad food and insufficient wages. The demands of the workmen regarding pay have been granted, and increased bread rations have been given. Work was resumed on Oct. 3rd.

* * *

A Stuttgart telegram to the "Frankfurter Zeitung" says that on Sept. 30th, between 11.35 p.m. and 12.45 a.m., Stuttgart was twice attacked by enemy aeroplanes. The majority of the bombs, the message says, fell on streets and open squares, causing no considerable damage apart from broken windows and the smashing of roof tiles. Two men were killed and four women and one boy wounded.

* * *

The special correspondent of the "Morning Post," writing from the British Front on Oct. 2nd, of the death of Lieut. Voss, says:

"The body of Voss, the famous German aviator, who was recently reported missing in a German communiqué, has been found behind the British lines. He was killed in a battle with a British aviator. . . . While patrolling at a height of nearly a mile and a half with other planes, the British aviator was attacked by a triplane and another machine. Voss was the pilot of the former."

After describing the fight, he adds:—

"Suddenly Voss swerved, and the planes nearly came into collision as he dropped to avoid a sudden burst of machine-gun fire. Our man saw him gliding westward with his engine shut off, and dived after him, pumping bullets into the triplane. It reeled, dropped, and disappeared. The victor sailed away, and it was not until later that the broken German machine was found on the battlefield, with Voss's body still wedged in the pilot's seat."

[It is notable that this is the first mention of a German triplane. If the statement is accurate, the fact is rather remarkable.—Ed.]

* * *

Mr. W. G. Shepherd, the special correspondent of the United Press of America, writing to the "Daily Express" from Stockholm, on Oct. 6th, says:—

During the past fortnight the Germans have been using Gothas with four engines, each of 260 horse-power. These machines are provided with fuel for a flight of ten hours, and carry five men—two pilots, two gunners, and a captain, who controls the wireless apparatus.

[If not true at the moment this seems a useful hint as to the future, and should be noted for reference.—Ed.]

* * *

According to a message from Cologne (via Amsterdam, Oct. 3rd) aviators appeared over that city during the night of Oct. 2nd. No bombs were dropped. Anti-aircraft guns shelled the aeroplanes, but none of them was hit. The population was greatly alarmed.

* * *

The "General Anzeiger" of Essen reports on Oct. 1st that under military orders all lights must be darkened in the Governmental district of Düsseldorf and throughout a great part of Westphalia. Similar protective measures against possible air attacks have been taken at Wilhelmshaven and other places in Western Germany.

* * *

Mr. H. Warner Allen, writing on Oct. 2nd from the French Front in the "Morning Post," says:—

According to the latest information, the Germans are carrying out trials with a "Tank" armed with a seventy millimetre gun and two maxims. The German "Tank" is provided with a pointed beak forward and has an armoured conning tower rising from its roof. It is reported that its armour comes down very low in order to protect the "caterpillars," which are almost entirely hidden by it.

* * *

A message from Berne, dated Oct. 2nd, states that the German public, according to German newspapers, rejoices over the fact that English towns have been bombed from German aircraft three times in one week. The Leipzig "Neueste Nachrichten," the influential organ of the National Liberal Party, recounts a successful visitation, "to quote an ironical expression used in the official communiqué," of English towns by German aircraft, and observes:

"We can be proud of the achievements of our aviators, who, in spite of great difficulties and dangers, continue to cross over to England and prove to the English that they are not safe from us even in their own country. Furthermore, every German air raid on England considerably weakens England's military strength, although, in accordance with old custom, the English newspapers always endeavour to hide the effects produced by our air bombs."

RUSSIA.

Official Communiqués.

Oct. 2nd.—On September 29th, in the Brody region, an enemy machine was shot down by our machine-gun fire, and yesterday another enemy aeroplane was shot down by our rifle fire in the Baranovitchi region. Pilot-Ensign Kamensky brought down a captive balloon.

In this region one of our aeroplanes, manned by Captains Gridnevsky and Radtchenko, fell from a height of 40-50 yards, and took fire. Both aviators perished.

In the Molodetchno region one of our machines returning from a scouting raid took fire, and Lieut. Migay and Ensign Rahkmaninoff were killed.

Oct. 3rd.—Baltic Sea.—On October 1st, during the night, the enemy undertook several air raids on Tserel (southern end of the island of Oesel, north of the Gulf of Riga) and dropped a few bombs, which set on fire one of our magazines. Explosions followed. Several officers and sailors who worked to extinguish the fire perished.

As reprisals our aviators dropped bombs on the camps situated on the Courland coast.

During the day enemy seaplanes tried once more to approach Tserel, but our aviators ascended to meet them, forced them to turn back, and to drop their bombs in the sea.

On October 1st, on the south-western front, we had three aerial engagements with enemy machines. Our giant aeroplanes of the Murometz type dropped several tons of bombs on the village of Korostkov, north-west of Husiatyn.

Oct. 4th.—An enemy aerial squadron attacked the village of Krasno, south-east of Grshimalovka. Eighty bombs were dropped, three privates being killed and four wounded. Several horses were also killed.

Oct. 5th.—In the evening of October 3rd one of our aeroplanes, whilst descending, preparatory to entering an aerodrome, crashed to earth. Capt. Konshin was severely wounded, while the observer, Sec. Lieut. Gollias, died as the result of his injuries.

On October 4th, between 4 and 6 a.m., our machines dropped bombs on enemy camps in the Smorgoni region.

Oct. 6th.—On October 4th, at 1.30 p.m., enemy aeroplanes raided the town of Galatz. As the result of the dropping of bombs casualties occurred among the civilians and soldiers.

Oct. 7th.—On the Caucasian front in the direction of Sivas a squadron of three of our aeroplanes made a raid in the region of Rifaji, where bombs of a total weight of more than four hundredweights were dropped.

Oct. 8th.—In the Tchik Seredina region (Rumania) our aviators bombarded the village of Nikloch and Palanka Station. The bombs set on fire a sawmill, the station, and some stones. A magazine exploded.

ITALY.

Official Communiqués

Sept. 30th.—The Admiralty Staff issues the following communiqué :—

On the night of Sept. 29th, while squadrons of our Caproni aeroplanes were effectively carrying out a fresh attack on the naval base at Pola, enemy aeroplanes dropped bombs on the neighbourhood of Ferrara, causing some damage, but, fortunately, no victims.

One of our groups of destroyers on patrol duty sighted a little before midnight a group of enemy destroyers supporting the seaplanes which had attacked Ferrara. Our vessels determinedly attacked the enemy, and seeing him immediately turn tail pursued him, shelling him until they reached the barrage of the Parenso batteries. Explosions were clearly observed on the enemy's vessels, which were hit again and again. Our vessels sustained no damage.

Almost at the same time another squadron, between 10 p.m. and midnight, attacked the South Adriatic coast in the district between Monopoli and Lecce, dropping many bombs on Ostuni and Brindisi. At the former place no damage was done, and at the latter, which was the particular object of attack, the material damage was unimportant, while five persons were killed, including two civilians, and twenty-two wounded.

The attack was received with violent anti-aircraft fire, which, besides limiting the effectiveness of the enemy's attack, brought down one hostile seaplane. The two aviators were taken prisoners. On the night of Sept. 28th enemy seaplanes, coming from Salvore and Trieste, bombarded the Aquileja-Villa Vicentina-Palma Nova district.

As an immediate reprisal, four of our seaplanes ascended and dropped on the military establishments of Capo di Salvore 18 explosive shells and several incendiary bombs. They returned undamaged to their base, in spite of violent anti-aircraft fire and the activity of the searchlights.

Oct. 3rd.—Air activity was lively. During the day one of our squadrons carried out a bombardment on the railway station of Grahovo (Bazza Valley, north-east of Gorizia). Last night in two successive raids the military objectives of Pola were bombarded with four tons of projectiles and greatly damaged.

Two enemy machines, brought down by our aviators, fell north of Auzza (Middle Isonzo) and near Podmelec (Bazza Valley).

Oct. 4th.—An enemy aeroplane attacked by one of our aviators above Auzza (Middle Isonzo) was forced to land in our lines; the pilots were made prisoners.

Oct. 5th.—During the night of Oct. 3rd and 4th one of our bombarding squadrons, composed of a large number of machines, audaciously flew over the naval base of Cattaro. The enemy, who was surprised, replied by a violent fire, which was badly regulated. Our aviators on several occasions and with visibly efficacious results hit torpedo-boats and submarines lying in the base.

* * *

A semi-official Note published in Rome says :—

"The only victims of the aerial raid carried out by the Austrians during the night of Sept. 29th-30th on the Lower Isonzo, announced in the Italian communiqué of Oct. 1st, is the noble Lady, Marie, widow of Clariciari, née Countess Ateems von Heiligenkreutz, who is related to the highest Austrian aristocracy.

"These are the laurels gathered by the Austrians during the course of their raids on Italian inhabited centres. We ourselves have always refrained from such barbarous acts, but the persistence of the Austrians in seeking to cause victims amongst the civil population will eventually lead to our adopting solemn reprisals. It is certain that the Italians do not lack any means to do this, as is known quite well by the Austrians."

* * *

The Rome newspapers of Oct. 2nd supply details of the air raid at Brindisi on the evening of Sept. 27th. It was 8 p.m. when the sirens gave warning of the attack. From then until 9.30 p.m. the firing of anti-aircraft guns was incessant, the searchlights meantime playing over the sky. The attack was renewed three times, probably by three different squadrons. The bombs which were dropped caused the death of five victims, of whom two were civilians, and injured 22. No military objective was hit.

A huge machine was brought down by the anti-aircraft guns. The aviators, who were made prisoners, are a naval captain and an infantry lieutenant, both Austrians. The machine was recovered by an Italian torpedo-boat. On board were found, besides bottles of brandy and wine, a loaf made of some vile substance whose nature could not be determined. An impressive funeral was accorded to the victims of the raid.

* * *

The Rome newspapers of Oct. 7th give details of a serious bombardment of Cattaro. In this the poet D'Annunzio commanded a group of Caproni aeroplanes, and the attacking machines carried 5,000 kilogrammes of explosives.

Mists prevented the enterprise till the third night, and on their way the aviators were subjected to fire from Mount Lovcen and other forts. The attack was delivered from a height of 13,000 ft. by the light of star shells.

All the objectives were reached. Hits were observed on submarines, torpedo destroyers, docks, factory and military works, and great fires broke out. In two hours' time the aeroplanes had returned safely.

U.S.A.

A message from Washington on Oct. 5th says that Mr. Baker, Secretary of War, announces that the 20,000 aeroplanes authorised by Congress recently are actually under construction, and that the necessary motors are now being built.

Mr. Baker adds that the whole aircraft programme is so co-ordinated that when the machines and their motors are completed, trained aviators, as well as machine-guns and other equipment, will be waiting, and he remarks :—"When this nation's Army moves up to participate in the fighting the eyes of her Army will be ready." The types of aeroplanes cover the entire range from light training machines to powerful bombing and battleplanes.

TURKEY.

Official Communiqués.

Oct. 1st.—Euphrates Front.—Early on Friday morning the enemy subjected to the fire of guns of various calibres for several hours the positions which had already been evacuated by our advanced troops. During these operations four enemy aeroplanes were brought down behind their own positions.

Oct. 5th—In the Gulf of Saros (north of the Gallipoli Peninsula) a British machine of the latest type was driven down by our fire. The three occupants were taken prisoners.

[It will be interesting to find out what really happened.—Ed.]

BELGIUM.

Official Communiqués.

Oct. 4th.—In the last two days our aviation service carried out 47 flights, several of which were by night, for the purpose of dropping bombs in reprisal for bombardments of our rear.

* * *

The "Belgisch Dagblad" reports that on Sept. 30th an Allied aviator dropped two bombs on a train consisting of forty cars filled with German soldiers on their way from Bruges to Ghent. The train ran off the rails. Many soldiers were killed or injured.

The same paper confirms the news that the sheds and aeroplanes at the St. Denis Westrem aerodrome near Ghent were destroyed by aerial attacks.

* * *

On Oct. 1st a siding at the Meirelbeke Station, near Ghent, was completely destroyed by bombs dropped by Allied aviators.

The "Courrier de la Meuse" learns that the railway station at Eecloo has also been totally destroyed in the same manner.

* * *

The "Telegraaf's" (Amsterdam, Oct. 7th) frontier correspondent says that last week the bombing attacks of Allied aviators made terrible havoc on the Flemish coast, whither many German soldiers had been sent to rest. Heyst, Knocke, Westcappelle, Ramscappelle, and Lisseweghe shook to their foundations. Heavy bombs fell on the Yser road bridge of Zeebrugge, and ten Marines were killed and many wounded. Others fell on Heyst and near Het Sas. Three villas collapsed, and wounded soldiers were afterwards removed from the débris.

On Oct. 2nd bombs fell near Zeebrugge Lock, the innermost gates of which warped. Great openings were also made in the quay walls, and six torpedo-boats lying between the locks and the Solvay factory were shut up in the canal. Soldiers were obliged to work day and night on the lock and quay, and it was not until two days later that the vessels were liberated.

According to a Sluis message Allied aviators bombed the aerodrome of St. Denis Westrem on Sept. 30th, when fifteen German machines were destroyed. One bomb struck the railway line and one the Nieppe bridge. The first bomb fell just before the

DELIVERY FROM STOCK.

arrival of a military train, with two engines and 45 carriages, carrying soldiers on leave from the front, and made a large hole on the railway track. The first engine fell into the hole, with the result that several carriages were derailed. The train was then bombed, and several casualties resulted.

* * *

The "Telegraaf" correspondent on the Belgian frontier telegraphed on Oct. 2nd: "At 11 o'clock on Sept. 30th aircraft bombarded the railway communications of Ghent, inflicting great damage and hindering the traffic. Aircraft bombarded Zeebrugge on Sept. 29th and 30th and on Oct. 1st. On Oct. 2nd a squadron of from 20 to 25 machines flew over Flanders."

HOLLAND.

A telegram from The Hague states that an aeroplane of unknown nationality dropped two bombs on Sluis on Oct. 1st. Two houses were destroyed, but no lives were lost.

* * *

It is officially stated that the German Government has apologised for the act of a German cadet-aviator in flying over Dutch territory on August 9th. It is explained that he lost his way in the clouds, and that on discovering he was over Eindhoven he returned by the shortest route to German territory.

* * *

The Dutch Serjeant Lok, who shot down the German aeroplane on August 18th, causing it to descend at Beerta, in the Groningen province, has received a testimonial consisting of a gold watch and chain and £54 subscribed for by 1,225 persons.

* * *

The "Handelsblad" (Amsterdam, Oct. 2nd) reports that 12 large aeroplanes of German make for the Dutch Army have arrived at Bentheim (Hanover), where they will be taken over by Dutch flying officers.

[It seems remarkable that Germany should be able to export aeroplanes to neutrals when we cannot fully supply our own needs. But perhaps they are obsolete types, and the Germans think it better to sell them than to burn them according to the English fashion.—Ed.]

THE FIELD MARSHAL'S OPINION.

Mr. H. Warner Allen, writing in the "Morning Post" from the French Front on Oct. 5th, says:—

It may be some slight consolation to those English people who have been suffering from the perpetual German air raids to have the Allies' air supremacy on the Western front confirmed from the pen of Hindenburg himself. In a captured document signed by the German Field-Marshal great stress is laid on the necessity of using the air forces of Germany with the utmost economy.

"Recently on the principal fighting fronts it has seemed that the enemy was trying to husband his aerial strength for pitched battles in the future. We should be making a great mistake if we overworked and exhausted our aerial units, which are inferior in number to those of the enemy, by employing them several times on a single day. . . . We cannot prevent the enemy's aviators from flying continually over our lines. The infantry and artillery must not be too nervous. Let us use our aeroplanes sparingly on calm days, in order that we may call upon them for a great effort on a day of crisis. . . .

"Our fighting-plane squadrons, which are far from numerous, must not be equally distributed over the whole of the front. They would always have to fight against odds, and would suffer losses out of proportion with the situation. They must be grouped sometimes here, sometimes there, so as to prevent the enemy's observation for a few hours at least, and make our own observation possible."

"In the meantime the French Air Service has not been idle. In the months of July and August the French fighting planes destroyed 94 enemy machines besides bringing down 99 machines in the enemy's lines, a large number of which were certainly destroyed. Six German kite balloons were brought down in the same period. During July the French bombardment squadrons made 145 daylight raids, in the course of which they dropped over eight tons of explosives, and 261 night raids, with over 48 tons of explosives. In August they made 233 daylight raids, with over nine tons of explosives, and 265 night raids, with nearly 41½ tons of explosives.

A GEOGRAPHICAL ERROR.

A message from Paris to the "Morning Post," dated Oct. 6th, says:—

"The Committee appointed before the war to arrange for the erection of a monument to Wilbur Wright has decided to proceed immediately with the work, and it is hoped that arrangements will shortly be made for the monument to be erected at Mons."

[It would be reasonable to erect a monument to the British Army at Mons, but why to the late Mr. Wright? Perhaps, however, the "Morning Post" man wrote "Le Mans," where Wilbur Wright first flew in Europe, and the sub-editor thought he knew better.—Ed.]

THE R.N.A.S. COMFORTS FUND.

On behalf of the Royal Naval Air Service Comforts Fund, Mrs. Sueter hopes all those who have so generously helped during the last three years will continue their kind support for the coming winter. Mrs. Henry Balfour, Langley Lodge, Headington, Oxford, will gratefully receive and acknowledge parcels of warm comforts. Donations should be sent to the Hon. Treasurer, R.N.A.S. Comforts Fund, London City and Midland Bank, 129, New Bond Street, London.

It seems hardly necessary once more to emphasise the hardships under which the ratings of the Royal Naval Air Service operate. They are stationed in every hole-and-corner place from the torrid to the frigid zones, generally far away from the amenities of human society; often, though necessarily, without leave for periods exceeding a year; and anything that one can do to contribute to their creature comfort or happiness is but the smallest indication that one can give of one's gratitude for their unselfish self-sacrifice.

In addition to cash contributions, gifts of the following articles will thankfully be received—mittens, mufflers, jerseys, woollen helmets, socks (dark blue or khaki only), and games, books, etc.

The fund is managed by a committee of responsible ladies, namely, Mrs. Henry Balfour, Mrs. Beuttler, Mrs. DelaCombe, Mrs. Edmonds (Hon. Secretary), and Mrs. Sueter (Hon. Treasurer).

During its existence, of nearly three years, the fund has been administered capably and economically, and one does not hesitate to recommend all who have the welfare of the men of the Royal Naval Air Service at heart to support liberally its work in the coming winter.

THE R.F.C. HOSPITAL.

The Johannesburg Branch of the Over-Seas Club has sent a contribution of £3,826 in response to the Club's appeal on behalf of the Royal Flying Corps Hospital.

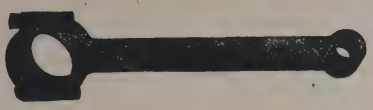
R.F.C. PAY

Regulations governing the issue of Flying Pay to officers of the Royal Flying Corps are amended by Army Orders issued on Oct. 5th in the following particulars:

An officer, whilst undergoing instruction in flying, shall receive continuous flying pay at the rate of 4s. a day in addition to the emoluments of his rank or appointment.

Flying pay under Article 222 may be issued continuously to an officer who is a qualified aeroplane or balloon pilot and graded as a flying or balloon officer, flight or squadron commander, during such time as he is employed on duty which involves flying. It may also be continued up to a limit of three months during periods of special Royal Flying Corps duty not involving actual flying.

An officer while undergoing a course of instruction in aerial observation duty shall receive continuous flying pay at the rate of 3s. a day in addition to the emoluments of his rank or appointment.



It is laid down, however, that the continuance of flying pay while on special duty not involving flying does not apply to officers employed on ground duty which unfits for flying, but only to specially authorised instructional tours, etc., on Royal Flying Corps duty undertaken by officers who are at the time in receipt of flying pay.

LONDON'S DEFENCES.

Lieut.-General Sir Francis Lloyd, the Controller of the Defence of London, addressed a meeting at Poplar Town Hall on Oct. 8th on the position in regard to air raids on London. He said that when the Zeppelins came we were absolutely powerless, and had the Zeppelins known what they could do—he presumed that they did not—they might have unloaded bombs on London to a far greater extent than they had. Zeppelin attacks had up to the present ceased. It was possible they might come again, but it seemed as if they would not because of the great danger of losing them.

Referring to the recent night raids, Sir Francis said that we suffered nothing then in comparison with the daylight raid of one Saturday morning. He was not going to say that we had arrived at a period when we could laugh at anything that was against us. We must make the most absolute endeavour to beat this dread thing, for one woman's life was as much to her family as thousands of women's lives to thousands of families. The air defence of London was in the charge of one of the ablest engineers, who for many months past had exercised his brain in trying the best that could be done with the materials at his disposal to defeat the invaders. That officer directed the barrage which went up—it was not quite clear how high, but as high as the enemy aeroplanes could go.

With regard to the immediate future, Sir Francis said: "We have no experience yet of the enemy coming on dark nights. I very much doubt his being able to do so, but the possibilities of the future are infinite, and it is impossible to say what he may

do. I am glad to say, however, that at present so far as we know we are pretty safe on dark nights and with bad weather."

[It would certainly be unwise to give an opinion till we see what happens on calm, starlit winter nights.—Ed.]

A member of the audience inquired whether the country was being humbugged over reprisals, and whether German influence was too strong for the Government to institute reprisals? Why had the Government allowed all the moonlight to go without taking reprisals?

Sir Francis Lloyd replied that he was not a politician, nor was he in the Government. They had heard what the Prime Minister said the other day: "We will give them hell." Sir Francis added: "I hope he means it. I fancy he does; but I have nothing to do with it. I do fancy, though, that there is every intention of having a go at them now straight away. Recently we dropped hundreds of tons of bombs behind the lines, and I expect that before long we shall hear of very big raids."

THE QUESTION OF REPRISALS.

A meeting "in support of an increased air service," called by the National Imperial Association, was held in the Central Hall, Westminster, on Oct. 3rd. Mr. F. M. Russell Davies (Chairman of the association) presided, and the speakers were Mr. W. Joynson-Hicks, M.P., Sir W. H. Cowan, M.P., Mr. J. H. Havelock Wilson, president of the Sailors' and Firemen's Union, and the Mayors of Stepney and Ramsgate.

The Chairman, after paying a tribute of gratitude to the men of the Royal Flying Corps and the Royal Naval Air Service (the order of precedence is his) said that the meeting was not called to criticise those responsible for the conduct of the war, but to support them in any steps they took for strengthening the Air Services and carrying the war into the enemy's camp. It was also a meeting to warn the responsible authorities that unless they took precautions to perfect the Air Services and to provide a sufficient supply of aeroplanes and trained flying men, they would be called to account when the proper time came.

Mr. Joynson-Hicks complained that the Government had lagged behind public opinion, and had not been ready to visit extremities on Germany. Despite newspaper warnings the enemy had been allowed to take the lead in the matter of raids. What the Germans had done we could do. The Gotha machine was only a copy of one of ours.

[This last statement is inaccurate in point of fact. The Gotha is not an imitation of any British aeroplane, although it is true that there are British bombing aeroplanes which are better than the Gotha.—Ed.]

GENERAL SMUTS AND REPRISALS.

On Oct. 4th the Association of Chambers of Commerce entertained General Smuts at luncheon at the Connaught Rooms, after which he made a somewhat lengthy speech, chiefly on the subject of reprisals.

General Smuts was optimistic as to the outcome of the war, and was certain that those in authority in Germany knew they were beaten men.

Nevertheless, it was necessary that air raids on England should be met by an air offensive into Germany, much though he regretted the necessity.

In the opinion of General Smuts such action was justified. Although he compared British bomb casualties very favourably with street accident casualties, he apparently expects more devastating results from our bombs.

It is just a little puzzling to contemplate this distinguished soldier's apology for the policy of bombing German towns. In his grief for the German populace he quite forgets to emphasise the great strategic factor which a nation's joy or panic contributes to the success or failure of its armies in the field.

AIR RAID WARNINGS.

The Mayors of the metropolitan boroughs held a specially convened meeting at the City Hall, Westminster, on Oct. 4th, to discuss the situation caused by the air raids. Sir George Welby, Mayor of Westminster, presided and most of the other Mayors were present. The following resolutions were adopted:—

1. That the day system of warnings should be extended throughout the night.

2. That an air offensive on the largest possible scale should be undertaken forthwith against the German cities and towns without distinction.

3. That the air services of the country should be unified and placed under one responsible head.

Copies of the resolutions are to be sent to the Prime Minister, the Home Secretary, and the Commissioner of Police.

The question of warnings was discussed by the Corporation of London on Oct. 4th.

Mr. A. V. N. Neville moved that the Government be urged to institute some effectual method of giving warning of impending air raids by night. There should, he said, be ample warning everywhere in order to enable women and children to seek shelter. If something were not done to ameliorate the condition of things there would be something more than a ferment in London.

The resolution was carried, and it was decided to send a copy to the Prime Minister.

THE AMERICAN AIRCRAFT FLEET.

The "Aerial Age," New York, for September 17th, makes the somewhat daring suggestion that the big aeroplanes now under construction in America, which are destined to bomb Germany, should be flown across the Atlantic to Europe and then to some point within easy striking distance of Germany. The scheme seems to have been inspired by Major R. Perfetti, of the Special Italian Aeronautic Commission to the United States, who proposes that Caproni aeroplanes or machines of the same nature should be adopted. As an experiment, and as an example, he advocates the flying of a Caproni triplane, equipped with three 700-h.p. motors, from Genoa to Halifax, Nova Scotia, via some point in Spain, and the Azores.

Lieut. Silvo Resnati, who claims to have flown Caproni aeroplanes for a total of 2,200 hours, agrees with Major Perfetti that the flight can be made. No scheme is set forth as to whether the machines will be flown to New York from Nova Scotia or carted there, or how long the preparations will take to make. Also, no estimate is given of the percentage of losses incurred through the miscellaneous perils of this admittedly perilous feat.

Confirmation is lacking that there is a suitable 700-h.p. aero-engine in Italy, and one would like some information as to the number of pilots who would fail to strike the lumps of rock in the Atlantic called, by courtesy, the Azores, and so perish miserably.

The need for re-erecting American aeroplanes in Europe is certainly to be regarded as a source of annoyance, but at the present time the Atlantic passage by water is so relatively safe, despite the machinations of the German submarines, that it would be far more difficult to attempt to fly the Atlantic with large numbers of machines than to ship them across.

The problem of the crossing of the Atlantic by air is certainly one that deserves suitable research, but, at the present time, when the resources of the different countries are so severely strained to build aeroplanes in enormous numbers, capable of less amazing performances than the crossing of the Atlantic, so much publicity to the accomplishment of a feat, which is actually of secondary importance, is almost unseemly; and as the name of one famous Italian firm is so persistently coupled with these proposals, they savour too much of a publicity campaign.

Personally, one looks upon the conquest of the Atlantic as a feat deserving to be achieved for the first time in no unqualified way. The hopping across of this ocean from one to another of

the various stepping-stones, which Nature provides, in the manner of the lady in "Uncle Tom's Cabin," who crossed the Ohio River in a series of leaps, seems but a half-baked way of achieving an accomplishment of vast historical importance.

Such a flight could undoubtedly be made by the much-advertised Italian triplanes; it could equally well be made by one of the British Handley-Page biplanes or by one of the big Porte boats, with one or two stops to pick up fuel at sea, or, for the matter of that, by a specially-faked Gotha. But one would like the attempt to be delayed until a machine is evolved which could start, say, from Plymouth and fly to New York, non-stop, and the establishment of a really big international prize, say, £100,000, should make the accomplishment of the distance, probably within a year of the cessation of hostilities.

The general conditions which it would be necessary to lay down would be that the machine should not alight from the start to finish of the journey, that both before and after its journey it should show it is capable of both starting and alighting on really rough water, and that it finish the journey in a condition which fitted it to make the return trip without structural alterations or repairs, and with no attention except as to engine and plane adjustments.

The achievement of a flight of this description would be worth fifty times the accomplishment of a qualified hop, skip, and a jump across the narrowest part of the Atlantic, and would greatly impress the traffic magnates, in whose hands commercial aviation of the future undoubtedly lies.—W. L. W.

HOSPITALITY AT THE LYCEUM CLUB.

The United Empire Circle of the Lyceum Club gave a dinner to officers of the Royal Flying Corps on Oct. 8th. Mrs. Frances E. J. Parker, who presided, in proposing the toast of the evening, said that there were no better flying men than ours in the world, and we looked on them all as heroes.

Brigadier-General Charlton, D.S.O., in replying, compared the former possibilities of flying 50 miles an hour at a height of 4,000 feet with those developed during the war of 21,000 feet at 110 miles an hour. Even if armaments were limited after the war, he said, there could be no curtailment of the commercial future of aviation. All the energy of military preparation would in that case be diverted into commercial channels, and if the interior of a continent required opening up instead of sending a punitive expedition it would only be necessary for an aviator to drop a bomb and all opposition would cease. There were also romantic possibilities connected with elopement and honeymooning, and an irate parent could be imagined raising his clenched fist to the sky. No one could say what sort of machines would be flown, so quick was the development, but he anticipated char-a-banc, lorry, racing and pleasure machines. As to when people would fly he predicted that they would fly all day and all night, and they must be independent of weather. The young would be the pilots, because flying demanded mental resolution, combined with the healthiest habit of body.

CAPTAIN LAUREATI IN LONDON.

Capt. Laureati was received at the Mansion House on Oct. 5th by the Lord Mayor, who expressed to him the congratulations of the Citizens of London. He was accompanied by Major the Hon. E. A. Stonor, of the Air Board. On leaving the Mansion House, he proceeded to the Stock Exchange, and had a cordial reception.

AN UNREASONABLE ORDER.

According to the "Daily Express," "Drivers and conductors of tramcars are forbidden to leave their cars in the event of an air raid, and the tram service must be maintained."

This order, which includes girls as well as men, is issued by the Commissioner of the Metropolitan Police, embodying Viscount French's orders.

"If there were an air raid," said a tramway official on Oct. 5th, "and the drivers and conductors of cars were to quit their posts, it would mean that the cars would be bunched up together, and hundreds of passengers would have to wait until the raid was over, or walk.

"If a bomb were to drop at Blackfriars, and a line of cars were left there, many lives might be lost, whereas if the service is continued there is less chance of being hit.

"We realise that the drivers and conductors are human, and the whole question is under consideration between the police and military. In the near future, no doubt, something will be arranged to protect the drivers as much as possible from the danger of falling bombs or shrapnel."

[This seems thoroughly unreasonable. Surely drivers and conductors have as much right to take cover as anyone else, and the passengers can take cover in the same places till the raid is over. Why should thousands of drivers and conductors be endangered just because a few dozen foolhardy people want to go on travelling. If a bomb were to drop at Blackfriars on a row of empty trams it would do no harm at all, and if the cars are running there is just as much chance of running into a bomb or a dud shell as running away from the spot where it is going to fall.—Ed.]

On the Directorate of Military Aeronautics.

The official announcement in Saturday morning's papers regarding the changes in the Directorate of Military Aeronautics—an announcement which will be found in its proper official form in its proper place under "War Office Communiqués"—must have been rather startling to those who were not much behind the scenes. Still, even to them it must have been evident that Major-General J. M. Salmond, C.M.G., D.S.O., was marked down for further distinction, in view of his rapid advancement during the past three years. And it is certain that no other appointment to the post vacated by Lieut.-General Henderson could have been more generally welcomed by both officers and men of the Royal Flying Corps.

From his earliest days in the R.F.C., as an Instructor at the newly formed Central Flying School, General Salmond has been universally popular, and he has the great gift of acquiring popularity while at the same time inspiring respect. His high qualities as a soldier, as proved by actual command of men in the field, are happily combined with personal charm, and his skill as a pilot with unusual organising ability. Those who served with him in the early stages of the war, and those who have worked with him in the Training Brigade (or Division, as it now is) alike bear witness to his ability to infect his subordinates with his own enthusiasm. All concerned with military aviation will accept his appointment to the post of Director-General of Military Aeronautics and to a seat on the Army Council as a happy augury for the future of the Royal Flying Corps, even if it is to become ultimately merely a branch of the great Imperial Air Service.

An Active Career.

John Maitland Salmond was born in London on July 17th, 1881, the son of Major-General Sir William Salmond, K.C.B., R.E., and was educated at Wellington. He was gazetted to the King's Own (Royal Lancaster) Regiment in March, 1901, and proceeded to South Africa, where he served in 1901 and 1902, receiving the Queen's medal, with three clasps. From 1903 to 1906 he served with the West African Frontier Force, and was promoted Captain in the King's Own on June 26th, 1910.

He took to flying in 1912, and learned to fly on a Grahame-White biplane at Hendon, his certificate being No. 272, dated August 13th, 1912. In November of that year he was appointed an Instructor at the Central Flying School, and was promoted to temporary Major, and Squadron Commander in May, 1913. He was gazetted Brevet Major on June 22nd, 1914.

He married, in 1913, Helen Amy, fourth daughter of Mr. James Forbes Lumsden, of Johnstone House, Aberdeen, but suffered the great misfortune of losing his wife on May 8th, 1916, Mrs. Salmond dying on the same day as that on which her daughter was born.

Major-General J. M. Salmond, C.M.G., D.S.O.

In the early stages of this war he commanded a squadron with marked distinction, and was mentioned in dispatches by Sir John French in October, 1914. On April 13th, 1915, he was gazetted temporary Lieut.-Colonel and Wing Commander. Later in the year he was promoted to Brevet Lieut.-Colonel and made a Companion of the Distinguished Service Order.

In 1916 he was made a Brigade-Commander, with rank as Brigadier-General, and took over the organisation of the Training Brigade at home, but prior to this he had been twice mentioned in dispatches by Sir Douglas Haig. During the present year he has been made a Companion of the Order of St. Michael and St. George, and was promoted to Major-General on the expansion of the Training Brigade to a Division.

General Salmond doubtless disbelieves in the bad luck attaching to the number 13, seeing that he was promoted to Captain on June 26th (a double 13), was gazetted Lieut.-Col. on April 13th, owns an aviator's certificate dated August 13th, and was announced to the world as Director-General of Military Aeronautics on October 13th. On behalf of all concerned with Military Aeronautics one wishes him continued good fortune.

Another Sphere.

Lieut.-General Sir David Henderson, K.C.B., D.S.O., who resigns the post of Director-General of Military Aeronautics, which he has held since its creation, was born in 1862, and entered the Princess Louise's (Argyll and Sutherland) Highlanders in 1882. He served on the Staff in South Africa as Director of Military Intelligence, and when the R.F.C. came into existence in 1912 he was Director of Military Training, having spent much of his military career on the Staff.

On the formation of the R.F.C. he gave up the more important post of D.M.T. to become Director-General of Military Aeronautics, thus demonstrating his faith in the future of the new corps, for whose existence he was very largely responsible, though, in referring to the early days of the R.F.C. one must always recall the heavy task of organisation so ably carried out by Captain (now Brigadier-General) F. H. Sykes. Since then General Henderson, promoted during the war to Major-General and then to Lieutenant-General, has devoted himself entirely to aeronautical affairs, and has done his best for the Corps.

At first he met with strenuous opposition from Treasury officials, and criticisms from politicians of various parties. Criticisms of R.F.C. administration in the House of Commons in 1913 and 1914 were unskilfully answered by the then Secretary of State for War (and previous Under-Secretary), Lieut.-Col. Seely, and unfortunately gave the impression that the Directorate of Military Aeronautics was hiding its own sins instead of, as later appeared to be the case, the sins of its political chiefs, and information concerning the equipment of the R.F.C. given by Colonel Seely, apparently on the authority of the D.G.M.A., was proved to be inaccurate. The position was undoubtedly difficult, and possibly the political cards might have been better played all round, to the advantage of the R.F.C.

At the outbreak of war General Henderson accompanied our miniature flying corps to France, but after a period handed over the command in the Field to General Trenchard, whose success in that post has been one of the outstanding features of the war. One would, in fact, have expected General Trenchard to have succeeded to the post of Director-General of Military Aeronautics, and the obvious explanation of his not doing so seems to be that no other officer could be expected to exert precisely that same wonderful personal influence over the officers and men of the R.F.C. on active service.

On his return to England General Henderson faced the task of creating an enormous flying corps out of nothing, and in spite of errors in policy before the war. If he was unfortunate in some of his assistants he was equally fortunate in others, as is shown by the brilliant staff now in control of Military Aeronautics, for all those to whom the R.F.C. now owes so much have come to the front under General Henderson's command.

As regards the special work for which General Henderson has been "lent," it is stated in the "Times" that he will devote his attention in future to the Air Board alone. This appears to be an eminently probable suggestion. It is unlikely that General Henderson would, of his own accord, dissociate himself from aeronautics, and it would not be surprising if his special work were concerned with the schemes pertaining to that Imperial Air Service, of which there has been so much talk lately, for it is generally understood that he has always been in favour of a single Air Service, as witness the original R.F.C. with its Naval and Military Wings. In any case, it is well to recognise that no man has worked harder in the cause of military aeronautics, nor has any done his duty, as he saw it, more whole-heartedly. Lieut-General Sir David Henderson, K.C.B., D.S.O., will, at any rate, go down to history as the founder of British Military Aviation.

Our Loss Another's Gain.

The appointment of Major-General W. S. Brancker to a command abroad will be regretted by many who recognise the high value of the work which he has done for the R.F.C. at home, though certainly those who are about to come under his command will profit thereby. General Brancker, as a Captain of Artillery on the staff of Sir Douglas Haig, was the first British officer to fly on duty in India, somewhere in 1911. Since then he has devoted himself entirely to aviation, and British aeronautics as a whole, as well as the R.F.C., owes him a great debt of gratitude.

General Brancker was born in 1877, was gazetted to the Royal Regiment of Artillery in 1896, and served in South Africa. He was promoted to Captain in 1902, and to Major in 1913, in which year he was gazetted to the R.F.C. Reserve, while serving as a G.S.O. on General Henderson's staff at the War Office in the newly established Department of Military Aeronautics. In August, 1914, on the outbreak of war, he was appointed Assistant-Director of Military Aeronautics, in which position he did most valuable work. Later he commanded a Wing in France, and later again he commanded a Brigade.

Last year he became Director of Air Organisation, as a Brigadier-General, and this year he was made Deputy-Director of Military Aeronautics, and was promoted to Major-General. In all these positions he has displayed a thoroughness and energy, with even a touch of ruthlessness, which has won for him a reputation for efficiency which has been justified by results. Those who have served under him admire his personal bravery as much as his purely military qualities He is an inveterate flier, and, though he himself is an occasion given to jesting at his own methods of handling an aeroplane, there are few flying officers who are better cross-country pilots. Wherever his new command may be, he will carry with him the good wishes of the great majority of the Royal Flying Corps.

The Defences of London.

There is one other officer who has of late done well in the King's Service who has to be mentioned here, though strictly speaking his concern with the Directorate of Military Aeronautics is indirect. During the

past week sundry curious paragraphs have appeared giving credit for the defence of London to various people. It has consequently been made known semi-officially that the Defences of London are really under the command of Major-General E. B. Ashmore, C.B., M.V.O. Certain papers have referred to him as Brigadier-General Ashmore, R.F.C., but that is only their way of putting it.

General Ashmore is, in fact, a Gunner Officer first, foremost, and all the time. He is incidentally an aviator of no mean ability. He was born on February 20th, 1872, in London, and after a highly distinguished career in the Royal Regiment of Artillery he attained his Majority on April 19th, 1909. He learned to fly on a Bristol biplane at Brooklands, his certificate being No. 281, dated September 3rd, 1912, so that as an aviator he is closely contemporary with General Salmond. He served as a G.S.O. in the Directorate of Military Aeronautics, doubtless with an eye to the use of aeroplanes as an accessory to artillery rather than as separate entities, and he went to France with the R.F.C. at the outbreak of war.

On November 18th, 1914, he was gazetted temporary Lieut.-Colonel, as a Wing-Commander R.F.C., but when later on he was promoted to Brigadier-General one gathers that it was as an artillery general that he took his step.

Naturally it is not permissible to say when or why he was appointed to command the London Defences, but it is obvious that a gunner officer who regards aeroplanes as a component part of the defence scheme rather than as the be-all and end-all of existence, is likely to achieve excellent all-round results. Probably none realises better than the enemy's raiding pilots the improvements which are constantly being made in our defences, but nevertheless it would be unwise to say very much about them. One can, however, safely say that good as they are at the moment they are far from being in full flower—if one may be permitted a trifle of imagery. They are, so to speak, still in the bud.

And doubtless when the Hun-fly comes trifling round the said bud in his usual self-confident way, he will find that the fire-blossom, to which Mr. Kipling's immortal Mowgli referred as "the red flower," will suddenly burst into full bloom with a splash which will considerably upset the inherent stability of even the most stolid German pilot.

One's confidence in the ability of the London Defences ultimately to deal with raiding aeroplanes as successfully as they have dealt with the Zeppelin menace must be one's excuse for what might otherwise appear to be unseemly levity on a most serious subject.

A Fair Outlook.

On the whole the prospects of Military Aeronautics have never looked so well as they do to-day, and it is earnestly to be hoped that if or when the Imperial Air Service comes into being, its extensive organisation will not be permitted to disorganise in any way the excellent situation in which the R.F.C. now stand. Young, energetic, and yet experienced officers, veterans in aerial warfare, hold all the chief positions in the Corps.

(Photograph by Swaine).

Major-General E. B. Ashmore, C.B., M.V.O.

They are in close touch with active service pilots, and with the latest ideas in aeroplane design and armament.

We have always had the best pilots in the world, we have for a long time had the best aeroplane designs in the world, we are rapidly acquiring the best system of aircraft production in the world, and one is fairly sure that we have now the best staff in the world where purely military aeronautics is concerned. Just as the Army in France has, in the Army's own phrase, "its tail well up," so the R.F.C. is feeling quite certain of its moral and mechanical superiority over the enemy. There is still much to be done. There will still be losses to mourn. There will still be mistakes to be criticised and to be put right. But, even as Sir Douglas Haig's men in Flanders, after all their adversities, are now on the top of the ridges, obtaining a Pisgah-sight of the promised land to the North and East, so one may safely say that military aeronautics has crossed the divide, and is on the fair road to becoming the foremost and greatest service of its kind in the world.—C. G. G.

THE S.B.A.C., LTD.

It should be noted that the offices of the Society of British Aircraft Constructors, Ltd., have been transferred from St. Stephen's House to 1, Albemarle Street, W.1, owing to the requisitioning of the former building for the use of the Food Controller.

For the future the telephone number will be Regent 5641, and the telegraphic address, Thesbac, Piccy, London.

THE CURTISS CORRUPTION CHARGE.

The October Sessions for the jurisdiction of the Central Criminal Court were opened by the Lord Mayor at the Sessions House, Old Bailey, on October 9th.

On the application of Mr. H. D. Roome, appearing for the prosecution, the hearing of the case of Mr. William Augustus Casson, on bail, who is charged with conspiring to contravene the provisions of the Prevention of Corruption Act in respect to Admiralty contracts relating to aeroplanes, was postponed until the next Sessions.

On More and More and Still More.

On the evening of October 10th the Viscount Cowdray, President of the Air Board, took the chair at a lecture given at the Æolian Hall by the well-known decorator and colourman in words who prefers to be known to the world as "Boyd Cable." In his introductory remarks Lord Cowdray set forth simply and clearly some of the problems which beset him in his official capacity.

Lord Cowdray said that in the last few weeks Mr. "Cable," who had served at the front as an artillery officer, and had done his writing in his scanty leisure, had been visiting some of the chief centres of aircraft production to inform the workers in those centres as to the magnificent work which the aircraft they were manufacturing were achieving in the field.

Mr. "Cable" had been placed temporarily at the disposal of the Air Board for this purpose, and the workers whom he had visited were most enthusiastic as a result. At one factory the workers subscribed quite a handsome amount from their wages for R.F.C. charities.

He himself (Lord Cowdray) was primarily responsible for the production of as many aeroplanes as could be designed and produced of the best possible type. What these should do was for the fighting Services to arrange.

A good many of the problems of aircraft production were not appreciated by some of those true and appreciative friends of the air services who allowed themselves by a few strokes of the pen to create on paper squadrons almost illimitable in number. There were limits to the supply of skilled labour and of raw material, not only for aircraft, but for other instruments of war, and there was a shortage of material not only of local but of world stocks arising from the orgy of destruction in which the world was involved, and from the enormous demands of the mechanical side of warfare.

Increase of production in one direction almost inevitably meant decrease of production in other directions, and war demands had to be considered as a whole. He was thankful to say that the Air Board's demands for men and material were considered to be of vital importance.

The number of aeroplanes and seaplanes had been enormously increased, and must now be considered highly satisfactory. But, like Oliver Twist, the demand was for more and more, and still more, and these demands were being met.

Nothing in the war was more wonderful or more successful than the Air Service. It had become the eyes of the Army, a scout for the Navy, the terror of the submarine, and it would be by no means an inconsiderable factor in determining the final victory which would compel our foes to sue for peace on terms which would secure the right and freedom of mankind for all time.

Some False Premises.

Mr. "Boyd Cable" then delivered his lecture, which was well illustrated by actual photographs taken by the R.F.C. at the front. Considered purely as a lecture it was very good indeed, for Mr. "Cable" has a clear and simple method of expressing himself, and has the gift of interesting his audience. But considered as an exposition of air war the lecture suffered from certain false premises, possibly unavoidable on account of the lecturer's official position, which would necessarily cramp his style if his personal opinions differed from official policy. Nevertheless one recalls a letter of Mr. "Cable's," which appeared many months ago in the public press, in which he advanced much the same opinions as those expressed in his lecture, these opinions being, in effect, that it is much more important for our aircraft to bomb enemy ammunition dumps and railways behind the fighting line than it is to bomb munition factories in Germany or to defend this country against bomb raids. In other words, the old official doctrine of "darkness and composure." I trust that I do not misrepresent Mr. "Cable," but that is distinctly the impression which his lecture last week and his letter of months ago convey to me.

His theory appears to be that by continually blowing up the enemy's dumps and cutting railways the strain on our men in the fighting line is relieved. In support of this argument he showed an excellent photograph of an ammunition train in a siding, well alight as the result of our aviators' bombs, and explained to his audience that this represented so many less rounds of ammunition fired into our lines, and so many lives saved, which is perfectly true, but in the argument lies an excellent example of the false premise when applied to the whole subject.

His theory of bombing reminds one of the excellent Mrs. Partington's efforts to sweep the roused Atlantic out of her house with a mop. The ordinary engineer would naturally proceed to curb the Atlantic with a coffer-dam if he desired to protect a small area, or with a sea wall if concerned with it on a bigger scale.

Official Examples.

Various official photographs have shown the relative inaccuracy of bomb-dropping as compared with gun-fire. Mr. "Cable" himself exhibited, with the just pride of a gunner officer, photographs illustrating the deadly accuracy of long-range gun-fire directed by aircraft. Sundry of my readers who were on the Somme will recall the astonishing shooting of a certain gun manned by the Royal Marine Artillery, which dealt faithfully with German positions round Bapaume at such ranges that the artillery observation machines of the period actually had to fly back towards their own lines to get within wireless touch of the gun to signal the corrections.

On the other hand, officially published photographs of bombed enemy aerodromes show the way in which bombs are sprinkled all over the place without doing damage. And I fancy that most artillery officers and R.F.C. artillery observation officers will agree that up to the extreme limit of range of big guns there is no comparison between the accuracy of shells and bombs.

Therefore, it seems obvious that better execution can be done on enemy dumps and railways in "Hunland"—which, as I mentioned in the last issue, is Allied territory occupied by the enemy—with long-range guns than with aeroplane bombs. In other words, a coffer-dam, or barrage, can be built up by artillery fire, for something very close on 20 miles behind the enemy's lines, which will block all his roads and railways, and do far more to hinder the flow of his ammunition to the firing line than can ever be done by trying to mop up the flow with aeroplane bombs.

This is an old, old theory, discussed long months ago in this paper, and supported by gunners and aviators alike, but it is worth restating now because our preponderance of artillery over that of the enemy makes such a long-range barrage more practicable, and because our increasing output of aircraft is making it possible "at the proper moment" to put up a more distant line of offensive-defence, which—to carry on

"Sopwith, Kingston"

the original metaphor—one may describe as the sea-wall. The fact that the proper moment is reasonably close makes it the more important that none of Lord Cowdray's more and more, and still more aeroplanes should be wasted in the mopping process.

Mr. "Cable" showed his admiring, if innocent, audience a pretty picture of a machine starting on a night bombing raid. One cannot for obvious reasons describe the machine, but to anyone who was able to envisage the lay-out or general design of a real night-bomber the picture would have been comic if it had not been for the underlying tragedy. But possibly this Heath-Robinsonian effort was shown on purpose, for the delectation of possible enemies among the audience, and one can only hope that the type is no longer in use.

The Weakness of Limited Vision.

Where Mr. "Cable's" theories or opinions fail is in that they do not consider the effect of neglecting to carry out bomb raids into Germany in the past as they should have been carried on, and that they do not consider the effect of omitting to defend the Metropolitan area, which we were assured in an official speech last week is the biggest munition producing area in this country.

Mr. "Cable's" vision of bomb raids seems to be limited to those made into "Hunland." He apparently is of the opinion that a bomb dropped on an ammunition train is of prime importance, and fails to see that the same bomb dropped in a munition factory in Germany would prevent the loading of many such trains. It is well to realise this fact clearly, as well as the corollary that all the bombs which missed that train fell among seasoned troops on whom they had little effect, whereas those which would have missed the factory would have fallen in the surrounding district, and would have had salutary effect on the workers belonging to that factory.

In the same way, if an ammunition dump is blown up another one is built up in a comparatively short time, whereas a thoroughly bombed factory is out of action for months, and its whole output for that period is destroyed (because it is not produced), and thus more lives are saved in the firing line than would be saved by blowing up dozens of trains.

Home Defence.

For precisely the same reason home defence is of prime importance. As Sir George Cave pointed out, every raid on this country means so many thousands of working hours lost. If one aeroplane shop of 400 men is shut down for ten hours—that is to say, for a whole night-shift—one may reckon roughly that one aeroplane less has been produced. The shop may be employed wholly on spares, or component parts, but anyhow 4,000 man-hours is about the equivalent of one ordinary aeroplane, so that means one less of the more and more, and still more machines which the Air Board is working so strenuously to produce.

Consequently, it is of vital importance that the work should not be interrupted, and if we omitted to defend this country we should be playing directly into the hands of the enemy. For which reason it is actually much more important that the defence should take place on the other side of the Channel than on this.

No matter how good our defences may be on this side, they cannot prevent a certain stoppage of work whenever a raid warning is given, and it is necessary to give a warning whether one enemy aeroplane or a hundred reach our coasts. Therefore, it is the more important to prevent them from starting from Belgium or Germany, as the case may be.

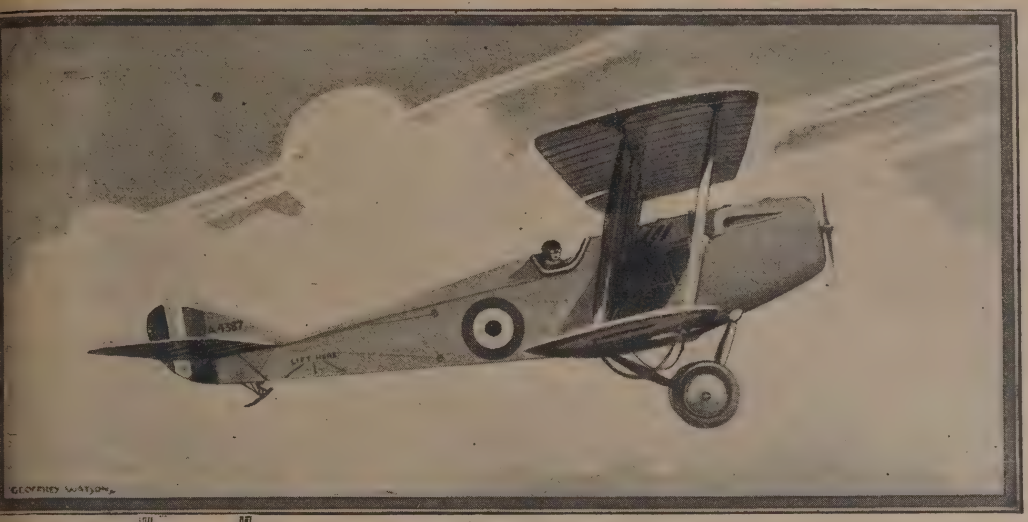
Mr. "Cable" will surely agree that the absence of one aeroplane from a reconnaisance squadron—owing to stoppage of work caused by an air raid warning—is likely to cost our men in the front line as many lives as would the presence of all the ammunition in that train, the destruction of which he exhibited with such gusto. Therefore, he may agree that it is at least as important for our bombing machines to attack enemy aerodromes in Belgium—as part of the defence of London—as it is to bomb dumps and railway lines in "Hunland," especially when his gallant corps, the Royal Regiment of Artillery, can do the job of smashing railways more cheaply and more accurately than can aeroplanes.

He made great play with the fact that for every pound of bombs dropped on our side of the lines—including London presumably—our aviators have dropped a ton of bombs in "Hunland." I therefore commend to his consideration the relative effect of one pound of bomb—plus an air raid warning—in any industrial centre, whether here or in Germany, as against the effect of one ton of bombs dropped among seasoned troops in the field.

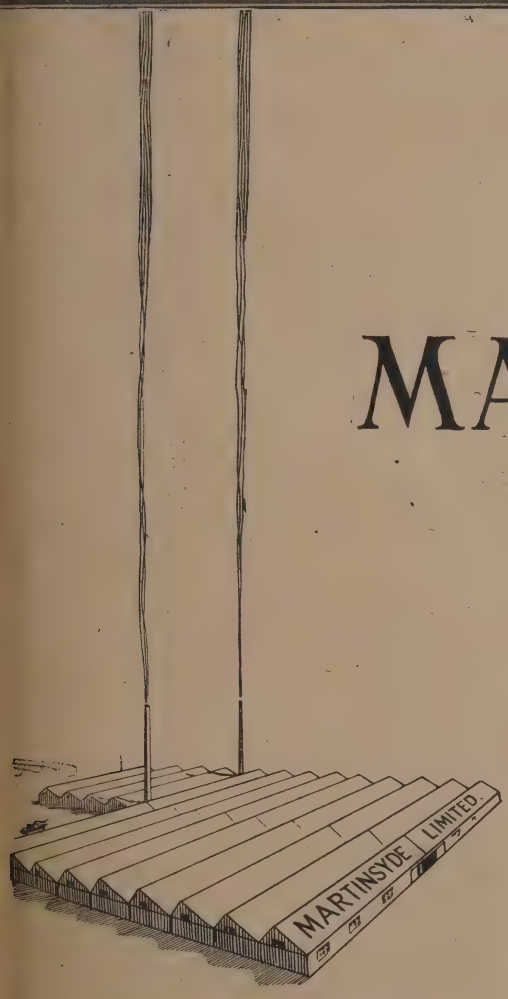
A couple of aeroplanes merely flying over a dozen German manufacturing towns every night would deplete the supply of ammunition in the firing line more than fifty aeroplanes dropping bombs in the dark on the supposed positions of ammunition dumps.

Overdoing It.

One felt, incidentally, at the lecture that in his earnest endeavour to create interest in and sympathy for our aviators, Mr. "Cable" rather overstated the danger of flying, and such overstatement of danger is liable to have a deleterious effect on recruiting for the R.F.C. He laid much emphasis on the fact that, apart from air fighting, every aviator takes his life in his hand whenever he goes aloft, and illustrated his statement with an excellent picture of an R.E.8 in a not unusual position, flat on its back after performing its favourite trick of falling over its own nose. The illustration was unfortunate, in that it indicated rather the habits of a species than the characteristics of a race.



None realises better than I do the dangers of flying, but when one knows something of the immense mileage flown by enthusiastic novices and reckless learners without a fatal accident one begins rather to believe in the inherent safety of ordinary flying. And even the grim casualty lists of the R.F.C. on active service compare very favourably with those of any battalion of the P.B.I.—as the Army calls its "poor blooming infantry"—when it goes over the top of its trenches.



Also, the aviator who survives returns to a decent dinner and a decent bed at the end of his day's work, and does not have to sleep on a ledge in a wet trench in imminent danger of falling in and being drowned if he turns over in his sleep.

The Better Whole.

Mr. "Cable," as I have said, is excellent in parts, but he could do better as a whole. I feel sure he could do much more to enthuse aircraft workers, and thus to assist Lord Cowdray in producing more and more aeroplanes, if he would endeavour to widen his vision and impress on his workshop audiences how very much more they will be doing to end the war when the machines on which they are working are destined to worry the German people as they themselves have been worried.

Consider for a moment the feelings of the workers themselves. One lot are working on school machines, very necessary work, but not inspiring when one considers that one's work for a month may be abolished in an instant through some silly kid losing his head

when learning, or acting the goat when showing off before his friends.

Another lot may be on artillery observation machines. A much more inspiring task. The idea that this machine on which one is working may guide a big gun to blow up a Hun general, complete with staff as fitted, is enough to make one enthusiastic.

But consider a shop at work entirely on aeroplanes or engines for the bombing fleet. Every piece of work one does is destined to go direct to Germany and "Give 'em Hell"—in the words which our pious Premier says he did not say. One can imagine the workpeople inscribing on their work such legends as "A message to the Kaiser, from Bill Smith," or "Here's one for Hindenbeggar from 'Liza Jones." A little skilful talking, either by the manager or by Mr. "Cable" would raise such enthusiasm as would multiply the output of that shop many times over.

I submit, therefore, that as we want more and more aeroplanes, the advocacy of raids on Germany, rather than their depreciation in favour of minor operations, is the better way to help their production, especially as public feeling and official policy for once agree on a matter of national importance.

Meantime, I commend to Mr. "Cable" a short course of study in the science of real bomb-dropping, for the "Christmas Tree" kind of bombing machine with which he appears to be familiar is as different from the real bomb-dropper as are the "Ladysmith" 4·7's and their haphazard methods in the early fighting in Flanders from the modern long-range guns plus modern artillery observation. A little modernising of his lectures in this respect would make them of even greater value than they are as an educative influence, and he certainly deserves great credit for the good work which he has done already.

The Greater Problems.

All this, however, is really by the way, so far as the problems to which Lord Cowdray referred are concerned, though the system of inspiring the workers to further efforts by means of lectures is thoroughly sound. The limits of space available, owing to the sudden announcement of the changes in the Directorate of Military Aeronautics, prevent me from referring to such subjects as the supply of labour and of raw material.

There is also the matter of the abolition of "leaving certificates" for workmen, which, in the views of some manufacturers, will seriously impede our output. I commend to all those interested in the subject, the study of a letter from "A Labour Correspondent" which appeared in the "Morning Post" of October 12th. Apparently men as well as employers are dissatisfied.

There is also the question of how best to deal with small workshops and "one-man businesses," which in the aggregate represent an enormous output. On this subject I have lately received a number of letters. All these are matters for future discussion.—C. G. G.

THE AERONAUTICAL WAR EXHIBITION.

The exhibition of war photographs and trophies, in aid of the Flying Services' Hospitals and Viscount French's War Charities, which has toured the principal towns in the provinces so successfully, will come to an end with an exhibition at the People's Palace, Mile End Road, where the exhibition will be opened on November 1st.

The exhibition was on view at the Grosvenor Galleries, New Bond Street, in the first instance, where it was visited by many distinguished people.

Thereafter the following towns and cities were visited:—

Birmingham, opened by Lieut.-General Sir David Henderson, K.C.B., D.S.O.

Coventry, opened by Sir Arthur Du Cros, Bart.

Liverpool, opened by The Earl of Derby.

Manchester, opened by Commodore Godfrey Paine, C.B., R.N.

Glasgow, opened by The Duke of Atholl, Mr. Lloyd George, and Viscount French.

Edinburgh, opened by Sir David and Lady Beatty.

Dundee, opened by Commodore Godfrey Paine, C.B., R.N.

Sheffield, opened by Lord Montagu of Beaulieu.

Leeds, opened by Mr. Asquith.

The notability who is to open the East End show has not yet been definitely fixed.

During the course of the tour 300,000 people have visited the show, and, exclusive of London, £4,000 has been raised for the Funds; the charge for admission having varied between 3d., 6d., and 1s., and in the Provinces the lower rates were usually charged.

[One hopes that all readers of this paper, who are able to visit the exhibition at the People's Palace, will make a point of doing so, as it is one of the most highly-interesting and educative shows imaginable.—C. G. G.]

LORD DERBY AND AIR WAR.

The Earl of Derby was present on Oct. 13th at a complimentary dinner and presentation given at the Exchange Hotel, Liverpool, by the National Union of Dock Labourers and Riverside Workers to one of their members, Private Ratcliffe, of the South Lancashire Regt., who won the Victoria Cross in the Messines Ridge fighting.

In the course of a speech, Lord Derby said that this country had, with the aeroplane menace, been brought within the war zone, and they must show the same courage at home as their soldiers did at the front. In London a considerable number of men and women were taking refuge in tubes on the slightest provocation, but among many of them it was difficult to understand the language they talked. (Laughter.) The great bulk of the community was not likely to be rattled by air raids, but he hoped they would never forget them. He recommended that this remembrance should be kept alive, as similar raids were remembered in Venice, by the erection of some memorial stone recording the locality of raids and the murders of women and children killed and inscribed with Kipling's words: "Lest we forget."

They must distinguish between the types of air raids—those on military objects, such as ours had hitherto been confined to, and those of Germans on undefended towns, involving the murder of innocent women and children. The former were perfectly legitimate, and no reprisals were asked for, because we had done the same thing ten times more effectively than the Germans, but their kind of bombing, what he would call the political bombing, was designed to demoralise our civilian population, which he did not believe would ever be successful.

Our authorities had now promised reprisals, and all he asked was that the public would leave the matter in their hands. It would be effectively done at the right time and in the right way. The only way to stop these raids was to drive the Germans out of Belgium, and then to give them something to think of in their own country. (Cheers.)

Fighting in the air was going to be something to end the war, and nothing in the way of political bombing should be allowed to take the place of the great military air offensive which was to contribute to that object. The Air Board and Ministry of Munitions were fully alive to the fullest necessities of both defence and offence in the matter of aerial activity. All the men and all the machines required would be forthcoming. Great sacrifices had already been made, and while he fully agreed with reprisals for what had been done in this country, their surest and best remedy would be to give Sir Douglas Haig all the help he needed to drive the Germans back to their own country.

[With which, of course, everyone will agree. It is only in conception of methods that one differs from Lord Derby, on the grounds that one bomb in a factory district in Germany is worth 20 on trains and railways in France or Belgium, as a means of decreasing the amount of munitions available in the firing line.—Ed.]

THE GERMAN TRIPLANES.

The recent newspaper reference to the existence of a German triplane is confirmed by the experience of British Flying Officers at the Front. The machine in question seems to be a single seater tractor-scout with excellent climb and speed, which is judged by some to be better than that of our machines at the time. Observers say that the chords of the wings are progressively narrower from top to bottom, and that the bottom plane is so easily hidden against the remainder of the machine when viewed from certain aspects that it does not always resemble a triplane in the least. One also hears of one or two narrow escapes on the part of British aviators from these German triplanes through mistaking them for their own, and it should no longer be taken for granted that a three-decker machine is necessarily of British origin.

NAVAL and MILITARY AERONAUTICS

FROM THE "LONDON GAZETTE."

Admiralty, Oct. 3rd.

Oct. 5th.—Temp. Flt. Sub-Lt. to be temp. Flt. Lt.:—B. H. Sisson, Oct. 4th.

Oct. 6th.—R.N.A.S.—To be temp. Sqdn. Comdr.:—Lt.-Comdr. Warwick Wright, R.N.V.R., Oct. 6th.

War Office, Oct. 9th.

REGULAR FORCES.—The following Wt. Officer to be Sec. Lt. for service in the Field:—

R.F.C.—Mil. Wing.—Actg. Sjt.-Maj. A. M. Cawthra, Sept. 14th.

Establishments.—R.F.C.—Mil. Wing.—Wing Comdr.—Maj. R. G. Cherry, M.C., R.A., from a Sqdn. Comdr., and to be temp. Lt.-Col. whilst so empld., Aug. 28th.

Sqdn. Comdrs.—From Flt. Comdrs., and to be temp. Majs. whilst so empld., Sept. 21st:—Lt. (temp. Capt.) K. D. P. Murray, Spec. Res.; Lt. (temp. Capt.) T. Maxwell-Scott, M.C., Spec. Res.

Adjt.—Lt. F. A. Stacpole, E. York. R., Spec. Res., and to be temp. Capt. (without the pay or allowances of that rank) whilst so empld., Sept. 17th.

Special Appt.—(Graded as a Park Comdr.).—Temp. Maj. E. A. Goodwin, Gen. List, from a Park Comdr., Sept. 22nd.

Equipment Officers, 2nd Cl.—From the 3rd Cl.—Sec. Lt. (temp. Lt.) C. A. Hudson, R.F.C., T.F., and to be temp. Capt. whilst specially empld., Aug. 8th, 1917.

War Office, Oct. 10th.

REGULAR FORCES.—Staff.—The following temp. appt. is made at the War Office:—

Dep. Asst. Dir.—Capt. (temp. Maj.) S. A. Currin, R.F.C., Spec. Res., from a Special Appt. (graded as a Park Comdr.), and to relinquish his temp. rank, July 10th.

The date of the appt. of Lt.-Col. R. J. B. Mair, R.E., as an Asst. Dir., is July 27th, and not as in the "Gazette" of Aug. 14th.

Establishments.—R.F.C.—Mil. Wing.—Flt. Comdrs.—From Flying Officers.—Capt. W. S. Scott, M.C., Lan. Fus., T.F., Sept. 7th. And to be temp. Capts. whilst so empld.:—Temp. Sec. Lt. (temp. Lt.) G. R. A. Deacon, Gen. List; Sec. Lt. A. G. V. Taylor, Ind. Inf., Sept. 26th.

Park Comdr.—Temp. Qrmr. and Hon. Lt. (temp. Capt.) S. C. Parr, R.F.C., from an Equipment Officer, 1st Cl., and to be temp. Maj. whilst so empld., Sept. 1st.

Equipment Officers, 1st Cl.—Capt. Sir J. W. B. Simeon, Bt., Hamps. R., T.F., from an Equipment Officer, 3rd Cl., Sept. 1st. Sec. Lt. (temp. Lt.) O. Lindquist, Spec. Res., from an Equipment Officer, 2nd Cl., and to be temp. Capt. whilst so empld., Oct. 2nd.

Schools of Instruction.—Schools of Mil. Aeronautics.—Instrs.—(Graded as Equipment Officers, 1st Cl.).—Lt. (temp. Capt.) G. I. N. Deane, R.E., T.F., an Equipment Officer, 1st Cl.; temp. Lt. A. Latimer, Gen. List, an Equipment Officer, 2nd Cl., and to be temp. Capt. whilst so empld., Aug. 17th.

Memoranda.—Sept. 19th, 1917: Cecil Stanley Southwell, Francis Gordon, Charles Henry Housden, Stanley Arthur Piper, Richard Edward Cragg to be temp. Hon. Lts. whilst employed as Asst. Insprs., Aeronautical Inspn. Dept.

War Office, Oct. 11th.

REGULAR FORCES.—General Staff.—G.S.O., 3rd Grade.—Lt. (temp. Capt.) C. E. Wardle, R.F.C., Spec. Res., from a Flt. Comdr., and to retain his temp. rank whilst so empld., Aug. 5th.

Establishments.—R.F.C.—Mil. Wing.—Flt. Comdrs.—From Flying Officers, and to be temp. Capts. whilst so empld.:—Lt. J. L. Williams, Spec. Res.; temp. Lt. F. B. Sedgwick, Gen. List, Sept. 1st.

Adjt.—Lt. N. A. Daniell, C. Gds., to be temp. Capt. (without the pay or allowances of that rank) whilst so empld., and to be Secd., Sept. 18th.

The King has been pleased to approve of the award of the Military Cross to

Lt. William Wallace Cook, N.Z. Forces and R.F.C.

For conspicuous gallantry and skill in an attack on a Zeppelin. He ascended from his station during a strong wind, thick mist, and low clouds and showed great determination, eventually giving up the attack when 60 miles out to sea.

His return journey was hazardous, but with great skill he eventually effected a landing in a field within a quarter of a mile of the coast, having been in the air for 5½ hours.

War Office, Oct. 12th.

REGULAR FORCES—Establishments.—R.F.C.—Mil. Wing.—Adjts.—Lt. (temp. Capt.) T. M. Eggar, Lond. R., T.F., vice temp. Sec. Lt. A. E. Morgan, S. Wales Bord., who relinquishes actg. rank of Capt., Sept. 6th. Capt. L. M. P. Sulivan, Lond. R., T.F., Sept. 4th.

Schools of Instn.—Schools of Mil. Aeronautics.—Asst. Comdt.—(Graded as a Sqdn. Comdr.).—Capt. G. G. Adeley, R. Ir. Rif., a Flying Officer, and to be temp. Maj. whilst so empld., vice Maj. P. E. L. Elgee, R. Perks. R., Sept. 18th.

Chief Instr.—(Graded as a Sqdn. Comdr.).—Sec. Lt. (temp. Capt.) W. C. Campbell, D.S.O., M.C., Spec. Res., from an Instr. (graded as a Flt. Comdr.), School of Mil. Aeronautics, and to be temp. Maj. whilst so empld., vice Lt. (temp. Maj.) G. S. M. Ashby, R.A., Sept. 18th.

Instr.—(Graded as a Flt. Comdr.)—Capt. C. O. Fairbairn, N. Lanc. R., Spec. Res., a Flt. Comdr., vice Sec. Lt. (temp. Maj.) W. C. Campbell, D.S.O., M.C., Spec. Res., Sept 18th.

School of Technical Training.—Gen. List.—The undermentioned Equipment Officers, 2nd Cl., to be temp. Capts. (without the pay or allowances of that rank) whilst specially empld.: Temp. Lt. C. H. Simpson, Gen. List, 2nd July, 1917. Temp. Lt. P. Ellis, Gen. List, 4th July, 1917. 16th July, 1917: Temp. Lt. C. M. Seth Ward, Gen. List; temp. Lt. C. S. Willmott, Gen. List. Temp. Lt. J. M. Bell, Gen. List, 18th July, 1917. Temp. Lt. W. J. King, Gen. List, 28th July, 1917. Sec. Lt. (temp. Lt.) F. N. D. Masters, R.F.A., T.F., 1st Aug., 1917. Temp. Lt. H. N. Sandys, Gen. List, 4th Aug., 1917. Temp Lt. R. C. Cox, Gen. List, 16th Aug. 1917.

The undermentioned, from R.F.C., to be temp. Sec. Lts. 24th Sept., 1917: Serjt. Frank Leslie Barnett, 2nd Cl. Air Mech. Harry Boswell Norris, Actg. Corpl. Sydney George Newport, Actg. Corpl. Hyman Cohen, Flt. Serjt. George William Cox, Flt. Serjt. Herbert Sidney Coxford Cann, Flt. Serjt. George Barnes, Corpl. Harry Alexander Dinnage, Corpl. Alec. Broadley, Corpl. Harry Moon, Serjt. Richard Alfred Munday, Corpl. Harold Robert Corby Van de Velde, Actg. Corpl. Gerald Ashby Wodehouse Garland, 1st Cl. Air Mech. Richard Henry Thomas, Actg. Corpl. George Louis Gordon Watson, Corpl. David Horace Fenner, Flt. Serjt. Ernest Taylor, Serjt. Maurice Leonard Metcalfe, Corpl. William Joseph Richards, Corpl. William Edward Lowrie, Corpl. James Harold Hunter, Serjt. Walter Massey, Serjt. Henry George Watts Lock, Serjt. Reginald Lord Heyworth Hulme, Serjt. Sydney William Smith.

The undermentioned 1st Cl. Air Mechs., from R.F.C., to be temp. Sec. Lts. 24th Sept., 1917: Claude Francis Lane, John William Power, John Thomas Baugh, Frederick Stanley Mockford, Cecil Thomas Christie, Sidney Charles Bown.

Memorandum.—Maj. the Hon. C. M. P. Brabazon, I. Gds., to be temp. Lt.-Col. whilst empld. as a Wing Comdr., R.N.A.S., 30th June, 1917.

War Office, Oct. 13th.

REGULAR FORCES—Establishments.—R.F.C.—Mil. Wing.—Sqdn. Comdr.—Capt. (temp. Maj.) J. V. Steel, R.A., from an Instr. (graded as a Sqdn. Comdr.), Schools of Inst., and from a Flt. Comdr., and to retain his temp. rank whilst so empld., Sept. 19th.

Flt. Comdrs.—From Flying Officers.—Temp. Capt R. D. Simpson, Gen. List, Sept. 25th: Lt. R. I. Van der Byl, Canadian Gen. List, and to be temp. Capt. whilst so empld., Sept. 26th.

Examining Officer.—Graded as an Equipment Officer, 1st Cl.—Temp. Lt. J. A. Payne, Gen. List, from an Asst. Instr. (graded as an Equipment Officer, 2nd Cl.), School of Mil. Aeronautics, and to be temp. Capt. whilst so empld., Aug. 17th.

NAVAL.

The following appointments have been made in the Royal Naval Air Service:—

Oct. 12th.—Flt. Sub-Lts.—H. Gartside-Tippinge and E. L. D. Bartley, both promoted to rank of Flt. Lt., seny. Sept. 15th.

Lt., temp. (R.N.V.R.).—W. L. Marsh, promoted to Lt. Comdr., temp. (R.N.V.R.), seny. Oct. 10th.

Proby. Sqdn. Comdr.—A. Leamon-Berry, confirmed in rank of Sqdn. Comdr., seny. Sept. 21st.

Proby. Flt. Lt., temp. G. D. Nelson confirmed in rank of Flt. Lt. (temp.), seny. Sept. 21st.

Late Lt., temp. (R.N.V.R.).—C. W. Small, granted temp. commission as Lt. (R.N.V.R.), seny. Oct. 11th.

Mr. S. J. Hern granted temp. commission as Lt. (R.N.V.R.), seny. Oct. 8th.

Leading Mechs., R.N.A.S., A. C. Tapser, and F. G. Tryhorn granted temp. commissions as Sub-Lt., R.N.V.R., with seny. Oct. 11th.

Oct. 13th.—Mr. F. M. Hannay, entered as Lt. (Temp.), R.N.V.R., seny. Oct. 12th.

Admiralty Communiqués.

Oct. 11th.—In the last 24 hours, 9th-10th October, patrols were carried out by the Royal Naval Air Service during which enemy trenches were attacked by machine-gun fire.

One pilot, on being heavily shelled by anti-aircraft guns, descended and attacked the guns' crews, scattering them and silencing the guns.

Early yesterday morning (October 10th) bombing raids were made on the following military objectives:—Thourout railway junction and trains; Lichtervelde railway junction and trains.

Large quantities of explosives were dropped.

All machines returned safely.

Oct. 12th.—Yesterday afternoon, in spite of heavy clouds and rain, naval aircraft carried out a bombing raid on Sparappelhoek aerodrome. Many bombs were dropped.

All machines returned safely.

Oct. 14th.—On the 13th, owing to unfavourable weather, operations by naval aircraft were restricted.

One of our fighter patrols, however, during the forenoon shot down an enemy machine over Ostend, which was observed going down in flames.

The Casualty List.

Reported Oct. 10th.

Missing.—Watson, Flt. Sub-Lt. M. J., R.N.

Injured.—Edwards, Flt. Lt. Ll., R.N.

Howell, Mr. H., Bsn., R.N.

Previously reported Missing, now presumed Killed.—Bowman, Flt. Sub-Lt. G. G., R.N.

Reported Oct. 11th.

Previously reported Missing, now presumed Killed.—Smith, Flt. Sub-Lt. Langley F. W., D.S.C., R.N.

Reported Oct. 12th.

Accidentally Injured.—Keith, Flt. Lt. C. H., R.N.

Snow, Sub-Lt. A. C., R.N.V.R.

Previously reported Missing, now reported Prisoners.—Desbarats, Flt. Sub-Lt. E. W., R.N.

Wilford, Flt. Sub-Lt. J. R., R.N.

Reported Oct. 13th.

Accidentally Killed.—Wood, Flt. Lt. M. C., R.N.

Previously reported Missing, now reported Prisoners.—Foster, Flt. Sub-Lt. W. E., R.N.

Burns, Obsr. Sub-Lt. H., R.N.

Reported Oct. 16th.

Accidentally Killed.—Horswell, Flt. Sub-Lt. B. W., R.N.

Wounded.—Sneath, Flt. Sub-Lt. W. H., R.N.

Accidentally Injured.—Wood, Flt. Lt. P., R.N.

Swann, Prob. Flt. Officer, L. E., R.N.

Missing.—Clemson, Flt. Comdr. A. W., D.S.C., R.N.

Black, Flt. Sub-Lt. N., R.N.

Previously reported Missing, now presumed Killed.—Strathy, Flt. Sub-Lt. F. S., R.N.

Baron, Flt. Sub-Lt. M. N., R.N.

PERSONAL NOTICES.

Deaths.

HORSWELL.—Flt. Lt. Basil W. Horswell, R.N., was accidentally killed while flying a seaplane on Oct. 11th.

KENDALL.—Flt. Sub-Lt. E. H. Kendall, R.N., reported as "presumed killed," was the younger son of Mr. and Mrs. E. C. Kendall, of Heswall, Cheshire. He was educated at Mr. Foster's, Stubbington, and Shrewsbury, School, where he won the school quarter-mile swimming race. He went to Salonika with the 2nd Duke of Cornwall's L.I. as lieutenant, was invalided home, and then joined the R.N.A.S., and had only been eight days at the front when, flying at a height of 13,000 ft., he was attacked by an enemy machine, had his petrol tank fired, and was killed.

Engagement.

YOUNG—GROSE.—The marriage will take place, at Elm Road Church, on October 27th, at 9 a.m., between Lieut. T. Kenneth Young, R.N.V.R., attd. R.N.A.S., elder son of Mr. and Mrs. Thomas F. Young, Ingress, Furze Lane, Purley, and Helen Dorothy, youngest daughter of Mr. and Mrs. Grose, Tintagel, Beckenham.

Births.

LLOYD.—On Oct. 10th, 1917, at 34, Albert Road, Regent's Park, N.W., Linda, wife of Flt. Lt. Wilfred Lloyd, R.N., of a son.

WOOLNER.—On Oct. 12th, at 38, Nevern Square, S.W., the wife of Flt. Lt. J. H. Woolner, R.N. (née Lucy Polgreen), of a son.

Flt. Sub-Lt. Norman Black, R.N., who is officially reported missing, left Christ's Hospital in July, 1916, when he was Senior Grecian and captain of the school. He was prominent in sport as well as in scholarship, and was the school's captain of cricket. He is now in his 20th year.

MILITARY.

G.H.Q. Communiqués.

Oct. 9th, 10.59 p.m.—The weather was even more unfavourable for flying on the 8th inst. than on previous days. Much work

Triplex Safety Glass

has proved itself to be without an equal for Goggles, Windshields, Windows, and Observation Panels. Clear as ordinary glass yet absolutely unsplinterable under all conditions. Has the approval of H.M. Admiralty and War Office.

"TRIPLEX" OBSERVATION PANELS

Telephone: Regent 1340.
Telegrams: "Shatterlys, Piccy, London."

W

was, however, done in aerial reconnaissance, and some artillery work was successfully carried out.

Two enemy machines were driven down out of control; ground targets were also attacked with machine-gun fire.

Two of our aeroplanes are missing.

Oct. 10th, 9.42 p.m.—On the 9th inst. little flying took place except on the battle front, where a great deal of work was done, in spite of a strong gale and thick clouds. The enemy's new gun positions and other suitable targets were reported by our aeroplanes to our artillery, which then dealt with them. Touch was kept with our infantry all day, and the enemy's troops were harassed by machine-gun fire at every opportunity.

A ton of bombs were dropped on Staden during the day, and at night two tons were dropped on Roulers, Courtrai, Menin, and Ledgehem stations (north-east and east of Ypres). A direct hit was obtained on a hostile train, causing a number of explosions.

In air fighting, four German machines were brought down and two others were driven down out of control.

Two of our machines are missing.

Oct. 11th, 9.30 p.m.—On the 11th (?10th) inst., stormy weather continued, and flying was only possible in the early morning and in the evening. These opportunities were taken by our machines to carry on artillery and photographic work, and a number of bombs were dropped by us on hostile billets and hutments and upon a German big gun position.

In air fighting three enemy machines were brought down and two were driven down out of control

Four of our machines are missing.

Oct. 12th, 9.58 p.m.—On the 11th inst. every opportunity was taken by our aeroplanes to reconnoitre the enemy's positions and to carry on artillery and photographic work during the intervals of clear weather.

A large number of bombs were dropped by our machines on hostile billets, and machine-gun fire was opened from low altitudes upon the German infantry in their trenches.

One hostile machine was brought down yesterday in combat and another was shot down by our infantry. Two other enemy machines were driven down out of control.

Five of our aeroplanes are missing.

Oct. 13th, 9.28 p.m.—On the 12th instant the weather could not have been less favourable for the co-operation of our aeroplanes with our infantry in their attack. None the less, machines went out till 4 p.m., both in the rain and during fine intervals, and with great difficulty succeeded in locating the position of our troops. The movements of the enemy were watched, and a great many hostile batteries were located and reported to our artillery.

In addition to this work, over 10,000 rounds were fired by our aeroplanes from machine-guns at hostile infantry in trenches and shell-holes and on the roads. Parties of mounted troops and convoys of hostile transport were also engaged from low altitudes, causing many casualties and great confusion.

Only a few German machines were encountered, presumably on account of the bad weather, and little fighting took place in the air. Four enemy aeroplanes were brought down, and five others were driven down out of control.

Ten of our aeroplanes are missing. The very strong west wind, and the suddenness with which storms of driving rain came up, accounted for the non-return of many of our machines. Several of those missing belonged to patrols which were not engaged in fighting, and evidently were lost in the storms.

Oct. 14th, 9.25 p.m.—Owing to the weather, very little flying was done on the 13th inst. In the fine intervals a certain amount of artillery and photographic work was accomplished, and the enemy's new positions were reconnoitred

One of our patrols encountered an enemy formation of double the number of machines, and a determined fight took place, from which four of our aeroplanes failed to return. Owing to the close nature of the fighting the number of hostile machines accounted for could not be determined by our pilots. Other Allied machines which arrived too late to take part in the fight saw from a distance several machines falling out of control.

Oct. 15th, 9.13 p.m.—On the 14th inst. there was a slight improvement in the weather.

Artillery work and photography were carried out by our aeroplanes, and 1½ tons of bombs were dropped on Ledeghen railway station and on hostile billets east of Lens

In air fighting three German aeroplanes were brought down and one was driven out of control.

Two of our machines are missing.

War Office Communiqués.

Oct. 10th.—The G.O.C. the British Forces in German East Africa reports:

Our aircraft have bombed Massassi and the enemy camps in its vicinity with excellent effect.

Oct. 12th.—The Secretary of the War Office makes the following announcement:—

Lieut.-General Sir David Henderson, K.C.B., D.S.O., having been deputed to undertake special work, has been lent for such service, and has thereby vacated his seat on the Army Council.

The Secretary of State for War has appointed Major-General J. M. Salmond as his successor as Director-General of Military Aeronautics, with a seat on the Army Council.

Major-General Brancker, at present Deputy Director of Military Aeronautics, has been appointed to a command abroad, and for the present his place will not be filled.

Oct. 15th.—The G.O.C. the British Forces in Macedonia reports:—

Doiran-Vardar Front.—Our aeroplanes have dropped bombs on a dump at Tchestovo (north-west of the lake) and on a railway train entering that place.

The Casualty List.

Reported Oct. 10th.

Killed.—Loyd, Capt. A. P. Buffs (E. Kent R.) and R.F.C.
Noble, Sec. Lt. H. T., R.F.C.
Tomlin, Sec. Lt. H. F., R.F.C.

Wounded.—Andrews, Sec. Lt. C. B., North'd. Fus., attd. R.F.C.
Harrison, Sec. Lt. A. W., R.F.C.
Ord, Sec. Lt. B., R.F.C.

Missing.—Campbell, Capt. J. S., A. and S. High. and R.F.C.
Haight, Sec. Lt. J. L., R.F.C.
Hood, Sec. Lt. R. P., R.F.C.

Reported Oct. 11th.

Killed.—Barnard, Sec. Lt. E. A., R.F.A., attd. R.F.C.

Previously reported Missing, now reported Killed.—
Allcock, Capt. W. T. L., R.F.C.

Westcott, Lt. G. F., R.F.C.

Previously reported Missing, now reported Prisoner in German Hands.—Rushworth, Capt. H. M., Lond. R., attd. R.F.C.

Reported Oct. 13th.

Killed.—Hughes, Lt. J. L., Welsh R., attd. R.F.C.
Rayner, Sec. Lt. C. O., R.F.C.

AIRCRAFT SUPPLIES.

TRADE MARK ASCOL REGISTERED

"ASCOL HOUSE"

THE SHOW ROOMS!

WE are now settling down in our new premises, and hope very shortly to be in a position to invite Aircraft Manufacturers interested in "speeding up" and increasing their output, to visit our New Show Rooms, where we shall display in orderly sequence all the requisite parts and equipment for modern Aircraft construction, covering most items from a Split Pin to a Complete Unit.

THE facilities we propose to offer should appeal especially to Designers, who, in order to make their designs as simple as possible, from a production point of view, propose to adopt the existing standards for minor fittings.

THE Show Rooms will contain practically every standard part, and Designers and Production Managers will find that an inspection of these will amply repay them for their trouble.

FOR ILLUSTRATED STOCK AND QUOTATION LIST SEE

"AIRCRAFT SUPPLIES"

OUR FORTNIGHTLY HOUSE JOURNAL.

Vol. II. No. 10.

Ready Thur. Next, Oct. 25th, 1917.

PUBLISHED fortnightly, on alternate Thursday evenings, and issued FREE to the Air Services and to the Aircraft Industry (those in charge of Stores and other Works or Service Departments ONLY), on application to the Secretary.

CONTAINS a complete LIST OF STOCK of Aircraft Parts up to the time of going to press, CURRENT PRICES, details of NEW ITEMS, ENQUIRY BUREAU, and other A.S.C. announcements. A SHORT ARTICLE will also appear in each issue on a topic of interest to Aircraft Constructors.

STOCK LIST contains over 400 items.

STRAINER EQUIVALENT CHART:—We shall include in the next issue of "Aircraft Supplies" a Chart containing full details of all Strainers used in the construction of Aircraft in this country. The Chart will give immediate reference to all details, and enable Manufacturers who are held up for Strainers of a particular strength to choose a Strainer of another type, but of approximately the same strength, which can be used (with the approval of the Air Board), in order that output will not be delayed.

An Innovation!

IN addition to our Fortnightly Illustrated Stock and Quotation List, contained in each issue of "Aircraft Supplies" and to our special Stock Letters, which are sent out in those weeks in which "Aircraft Supplies" is not issued, we now propose to provide a series of special sheets containing full lists of all sizes of Standard Parts used. Each sheet will be devoted to a special A.G.S. Number, and will contain full details of all lengths, etc. A blank space will be provided for the stock in hand, and the present market prices, and immediately on receipt of an enquiry the details of Stock and Prices will be filled in, and the sheet posted at once.

It will be seen that it will pay Aircraft Manufacturers to send us as far as possible a complete list of their requirements, and that under this new system it will be an extremely simple matter for us to quote in detail for all items by return of post.

"The A.G.S. Book"

By BERNARD ISAAC.

130 Pages. Over 230 Illustrations.

APPLICATIONS must be made on the special forms which may be had from The Aircraft Supplies Co., Ltd., 166, PICCADILLY, LONDON, W.1.

PERSONAL NOTICES.

DEATHS.

ARMITAGE.—Sec. Lt. Eric Armitage, R.F.C., who died of wounds on Oct. 4th, was the third son of Geo. Armitage, Westfield House, Rothwell, near Leeds. He was 19 years of age.

BASCOMBE.—A verdict of "Accidental death" was returned on Oct. 12th in Lincolnshire at an inquest on the body of Sec. Lt. Cecil R. Bascombe, R.F.C., who was killed while flying on Oct. 10th. He was the only son of Mr. and Mrs. Reginald Bascombe, of Alvington House, Bury St. Edmunds, and was 19 years of age.

BIRD.—Lt. Dudley Joseph de Angulo Bird, R.F.A. and R.F.C., who was previously reported missing and is now reported killed in action on June 27th, was the fourth son of William Bird, of Metton, Norfolk. He was 23 years of age.

BULLOCK-WEBSTER.—Lt. Frank Hamilon Bullock-Webster, Canadian M.G.C., attd. R.F.C., who was shot down while fighting an enemy aeroplane on Sept. 20th, and died of wounds the same day, was the eldest son of H. Bullock-Webster, of Auckland, New Zealand, and nephew of Mrs. Allaway, of Llanbedr, Merionethshire. Born in the Waikato, in 1885, he was in British Columbia when war was declared, and immediately enlisted, but was soon given a commission in a Canadian battalion, and came to England in the autumn of 1915. He was transferred to the M.G.C., and went to France in August, 1916, and was invalided home with trench fever in November. When he recovered he was transferred to the R.F.C. He went to the front again last July.

CHOWN.—Sec. Lt. F. J. Chown, R.F.C., who was killed in an air fight on September 20th, aged 19, was the only son of Dr. and Mrs. Chown, of Townshend, near Hayle, Cornwall. He was educated at Temple Grove and St. Paul's School. He passed for Sandhurst, but entered the R.F.C. direct from school in July, 1916, and graduated as a pilot last May. After a short period of service as instructor, he volunteered as a scout, and went to the front only a month before his death.

CLARKE.—Lt. Francis Charles Erlin Clarke, Worcestershire Regt., attd. R.F.C., who died of wounds on Oct. 11th, was only son of Mr. and Mrs. C. T. Erlin Clarke, of Lark Hill, Worcester. He was 21 years of age. He was promoted in the Worcesters in June, 1915, and had his "wings" in the R.F.C. in April of this year.

COX.—Sec. Lt. Derek Percy Cox, R.F.C., returned as missing on August 21st last, is now reported to have been killed on that day. He was the only son of Major-General Sir Percy Cox (now on active service as Political Officer) and Lady Cox, and was 21 years of age. He was educated at Harrow, Woolwich, and Sandhurst, joined the Machine Gun Corps early in 1915, and remained with this corps until he was transferred to the R.F.C. in May, 1916. In October, 1916, he was invalided home, and after two months' leave rejoined the R.F.C. in England.

His commanding officer writes:—"Your husband was a splendid pilot and had done extremely good work. He is a very great loss to the squadron, both on account of his capabilities and his personality, which endeared him to everybody."

DENNIS.—Sec. Lt. Charles Cowley Dennis, R.F.C., son of Mrs. H. Dennis, of Ilford, was killed on September 25th. Born in 1895, he was educated at Christ's Hospital from 1905 to 1910. He joined the London Irish Rifles in the spring of 1915, and was subsequently granted a commission in the 19th London Regiment. He was wounded in action, came home for a short time, and then transferred to the Royal Flying Corps After a successful engagement with the enemy he was brought down in "No Man's Land" and instantly killed. His body was subsequently recovered by the French.

DE TEISSIER.—Sec. Lt. Aubrey de Teissier, R.F.C., after a flight in South-east Essex on Oct. 13th, was descending from a height of only 150 ft. when his machine side-slipped and fell to the ground, and the pilot died before he reached the hospital to which he was taken.

FOUBISTER.—A verdict of "Accidental death" was returned at an inquest held in Outer London on Oct. 11th on the body of Sec. Lt. John L. Foubister, R.F.C., a New Zealander, who was training as a pilot. The evidence showed that Mr. Foubister

was instructed not to attempt to turn until he had reached a height of 1,000 ft., but when he was about 500 ft. up he turned, and a gust of wind caught his machine, which fell into a field.

GAYNER.—Sec. Lt. W. J. Gayner, Somerset L.I., attd. R.F.C., reported missing on May 9th, is now reported killed on that date. He was the son of Mr. W. A. Gayner, of Bath, and went to India with the Somerset L.I., but returned to England for a commission. Afterwards he went to Mesopotamia, and going back to Alexandria he passed through the school of flying. Again returning to England he was engaged for some time in training pilots, and he went to the front in April. He was 23 years old.

GIBSON.—Sec. Lt. Edgar Daniell Gibson, R.F.C., was killed on Oct. 9th, aged 19. He was the third and youngest son of Mr. Walter M. Gibson, M.V.O., I.S.O., and Mrs. Gibson, of The Croft, Oxted, Surrey. Educated at St. Christopher's, Eastbourne, and Wellington College (Hardinge Dormitory), he joined the R.F.C. on leaving school, was gazetted on Aug. 1st, and went to the front on Aug. 22nd. His eldest brother, Lt. Malcolm Reginald Gibson, East Surrey Regt., was killed on Oct. 8th, 1915.

GRIFFIN.—Capt. Cecil S. J. Griffin, Gordon Highlanders, attd. R.F.C., who died in Croydon War Hospital on October 11th, as the result of an accident while flying, was the only son of Lt.-Col. C. P. G. Griffin (now attd. to the Suffolk Yeomanry) and Mrs. Griffin, of Berridon Hall, Bradworthy, Devon, and was 22 years of age. He was educated at Tonbridge, and married the only daughter of the late Mr. S. Oxenham. He was gazetted to the Gordon Highlanders in May, 1914, and served with the regiment on the Aisne, Marne, and before Ypres, being wounded in September, 1914. He joined the R.F.C. early last year and saw service at the front.

An inquest was held at Croydon on Oct. 13th. According to the evidence, Capt. Griffin was leaving a Surrey aerodrome when the engine misfired badly. At a height of about 150 ft., and when some 400 yards from the aerodrome boundary, Capt. Griffin tried to turn. The wind, however, caught the tail of the machine and made it nose-dive, the pilot being too near the ground to be able to recover. When lying in the hospital afterwards, Capt. Griffin said that by mistake he failed to do the right thing on finding himself in difficulties. All the R.F.C. witnesses agreed that Capt. Griffin was a good, safe pilot. A verdict of accidental death was returned.

JARVIS.—Capt. A. B. Jarvis, Middlesex Regt. and R.F.C., who was killed in action on August 10th, was the fourth son of the late E. F. and Mrs. Jarvis, of Albert House, Cromer. He was 24 years of age.

MACKENZIE and GARLIE.—Capt. M. Mackenzie, R.F.C., aged 28, and Capt. André Garlie, aged 33, of the French flying service, who came to England to study British methods, were killed in a flying accident on the South Coast on Oct. 13th. Their machine nose-dived and came to earth, and both died on the way to hospital.

A verdict of accidental death was returned at the inquest on Oct. 15th.

MAYNE.—Sec. Lt. Denis John Heriot Mayne, Royal Irish Rifles, attd. R.F.C., who was killed while flying in Middlesex on Oct. 11th, was the only surviving son of the Rev. J. St. C. Mayne and Mrs. Mayne, of 29, Cavendish Road West, N.W.8. He was 18 years of age.

MIALL-SMITH.—Lt. G. Eric Miall-Smith,, M.C., Norfolk Regt., attd. R.F.C., whose death was announced last week, was brought down in air-fighting over the German lines on September 25th, being mortally injured. His German antagonist was also shot and both machines came to earth side by side. He was educated at University College School. He had been twice wounded while serving with the Norfolk Regiment, and was awarded the M.C. for brave and skilful conduct on July 1st, 1916, when he organised some scattered units, took a German strong point and 160 prisoners. His only brother, Arnold, lieutenant in the Royal Fusiliers, was killed on September 26th, 1916.

MOODY.—Sec. Lt. Charles Angelo Moody, R.F.C., previously reported missing, is now reported by the Germans to have been killed in air fighting on August 31st. The son of the Rev. H. Moody, vicar of Welshampton, Ellesmere, he was educated at King William's College, Castletown, Isle of Man, where he was in the football fifteen in 1915-16 and the cricket eleven in 1916. A lance-corporal in the O.T.C., he joined the R.F.C. in December, 1916, and went to the front last July. His twin brother is also in the R.F.C.

PIERSON.—Sec. Lt. Christopher Frank Kirshaw Pierson, R.F.C., killed on Oct. 10th, was the youngest son of the Rev. Kirshaw T. Pierson and Mrs. Pierson, of The Grampians, Hastings. Born in 1899, he was educated at St. George's, Windsor, and at Christ's Hospital, Horsham. He was trained in the Cadet Corps at Jesus College, Oxford, and was gazetted last April, and at once proceeded to the front.

His Squadron Commander writes:—"Your son was a most able and reliable pilot and one of my best officers. He had always done his work well and cheerfully. . . . A good artillery observer and brave to a fault."

RICHARDSON.—Sec. Lt. William Quintus Newsum Richardson, R.F.C., who was killed while flying at Essex Goldhanger, on Oct. 6th, was the eldest son of the late W. S. Richardson, Esq., of Lindum House, Lincoln, and Mrs. Richardson, of Bradfield, Berks. He was 19 years of age.

RUSSELL.—Lt. Eric Russell, M.C., R.F.C., who died of wounds on Oct. 7th, was the youngest son of the late C. H. Wilkinson and Mrs. Wilkinson, of 55, St. Mary's Mansions, W.2.

STEAD.—Lt. John Kenneth Stead, 4th Batt. Yorks Regt., attd. R.F.C., died of wounds in France on February 4th, 1917. Prior to the war, Mr. Stead was a student at Armstrong College. He was elected a Graduate Member of the Institution in October, 1913.

STEWARD.—Sec. Lt. A. A. Steward, R.F.A., attd. R.F.C., who was killed on Oct. 6th, was the younger son of Canon Steward, of Boyton Rectory, Codford, Wilts, and of the late Mrs. Steward. He was educated at Wellington and Magdalen College, Oxford. He held a commission in the Norfolk Militia during the South African War, in which he saw active service. He was subsequently ordained by the Archbishop of York to a curacy in Hull, and at the outbreak of the war was on the staff of St. Mary's, Johannesburg. He returned to England, offered his services as a combatant officer, and was given a commission in 1915 in the R.F.A., proceeding to the front in April, 1916. He was transferred recently to the R.F.C. as an observation officer. He married in 1912 Miriam, third daughter of the late S. H. Carver, of Alexandria, and of Mrs. Carver, The Moat, Downton, and leaves three daughters.

An S. I. A. Biplane, with Fiat Engine, of the type made famous by Captain Laureati.

WOOD.—Lt. Maurice Herbert Wood, Lincoln Regt., attd. R.F.C., reported missing on April 13th last, is now known to have been killed four miles over the enemy lines on that day. He was the fourth son of Mr. and Mrs. A. W. Wood, of Eversley, Grove Hill, Woodford, Essex, and was educated at Bancroft's School and University College, London, taking his B.A. degree with honours in history and French. At University College he belonged to the O.T.C., and he was on the staff of the Grammar School, Stamford, Lincolnshire. He received his commission before the outbreak of war, and went to the front in February, 1915, as bombing officer to his battalion. Later he was appointed second in command of a grenade school, and was mentioned in dispatches. He came home July, 1916, to join the R.F.C., and returned to the front early in the year. He was married last February to Hilda, elder daughter of the late T. O. Newman and Mrs. Newman, The Hollies, Stanstead, Essex.

WORMULL.—Lt. C. F. Wormull, R.F.C., who died on Oct. 4th, at Stamford Infirmary, from the effects of injuries received through the falling of his aeroplane, was the eldest son of F. A. S. and Mrs. Wormull, of Catford.

Engagements.

CORBY—KNECHTLI.—An engagement is announced between Hugh George Corby, Captain, Royal Munster Fusiliers, attd. R.F.C., and Beryl Kathleen, only daughter of Mr. and Mrs. Jack Knechtli, of 52, Carson Road, West Dulwich.

FARROW—MURRAY.—An engagement is announced between Mr. R. C. Farrow, C.F.A., attd. R.F.C., and Miss Mary Hay Murray, youngest daughter of the late Evelyn Hay Murray, of Hascombe, Godalming.

IRONS—SMITH.—The marriage of Capt. Roy Irons, R.F.C., and the Hon. Winifred Smith will take place quietly at St. Peter's Church, Eaton Square, on Wednesday, the 24th inst., at a quarter past two o'clock. All friends will be welcome at the church.

MARTIN—BARRY.—An engagement is announced between Capt. G. Neville Martin, Durham Light Infantry and R.F.C., only son of the late Mr. G. H. Martin and of Mrs. Martin, of Bedford, and Aldis, daughter of Mr. and Mrs. C. J. Barry, of Hampstead, N.W.

SAMWAYS—LOGAN.—A marriage has been arranged, and will take place on November 10th, between George Richmond Samways, R.F.C., and Heléne, younger daughter of Captain William Logan, late of the Gordon Highlanders.

SPENCER—BEATTIE.—A marriage has been arranged, and will take place very quietly on November 10th in London, between Harold Sherwood Spencer, Captain, Royal Irish Fusiliers, attd. R.F.C., and Ella Shearer, eldest daughter of Mr. and Mrs. James Beattie, of Canmore, St. Andrews, and 4, Buckingham Street, Buckingham Gate, London, S.W.

WARD—NICHOLSON.—A marriage has been arranged, and will shortly take place, between Capt. Herbert Sanford Ward, R.F.C., elder son of Herbert Ward, of 105, Avenue de Malakoff, Paris, and Joyce, younger daughter of Sir Charles Norris Nicholson, Bt., M.P., of 35, Harrington Gardens, S.W.

Marriages.

ADDINSELL—BLACK.—On Oct. 13th, at St. Paul's, Knightsbridge, Lt. I. E. Addinsell, the Royal Munster Fusiliers, attd. R.F.C., son of Mr. and Mrs. W. A. Addinsell, was married to Muriel, daughter of Mr. and Mrs. R. J. Black, by Prebendary Leith Boyd.

HILL—MORTON.—On Sept. 26th, at Houghton Church, Stockbridge, Major R. M. Hill, M.C., R.F.C., was married to Helen, elder daughter of Lieut.-Col. E. R. Morton, by the Rev. E. H. Firth.

ROME—STILES.—The marriage between Lt. S. G. Rome, M.C., Argyll and Sutherland Highlanders and R.F.C., younger son of Col. and Mrs. Rome, Knockbay, Campbeltown, Argyllshire, and Dorothy Jalland, only daughter of Lt.-Col. Harold J. Stiles, M.B., F.R.C.S.Ed., R.A.M.C. (Temp.), and Mrs. Stiles, 9, Great Stuart Street, Edinburgh and Whatton Lodge, Gullane, took place on Wednesday, Oct. 17th, at St. Giles's Cathedral, Edinburgh.

WINGATE—GARRATT.—On the 11th inst., at St. Andrew's Church, Hertford, Sec. Lt. George J. Wingate, Essex Regt., attd. R.F.C., third son of the late Mr. Wingate and Mrs. Wingate, of Amhurst Park, London, N., was married to Betty, youngest daughter of the late Mr. W. Garratt and Mrs Garratt, of The Walnuts, Hertford, by the Rev. N. T. Gardiner.

Birth.

MACDONALD.—On Oct. 1st, at 4, Prince Edward's Mansions, Palace Court, W., the wife of Capt. G. K. Macdonald, Sherwood Foresters and R.F.C.—a daughter.

AERONAUTICAL ENGINEERING

SUPPLEMENT TO "THE AEROPLANE"

INCORPORATING AIRCRAFT ENGINEERING, AERODYNAMICS, AND MATTERS PERTAINING TO THE AERONAUTICAL ENGINEER AND THE AIRCRAFT TRADER

THE TRAINING OF APPRENTICES.

BY A. W. T.

[Every employer of labour has, in these days and for some years back, experienced great difficulty in finding men who really know their jobs. This general state of ignorance among the younger generation is due to the excellent old-fashioned system of apprenticeship falling into disuse. It is therefore of national interest to know that an earnest attempt is being made in the Aircraft Industry to revive the system of indentured apprenticeships.

The system which is explained hereafter has been evolved by the Gnome Engine Co., Ltd. (Peter Hooker, Ltd.) of Walthamstow, and is designed to enable every boy in the employ of the firm to start with an equal chance of making good in after life. Those who are interested in promoting the future welfare of youths of good character are strongly advised to try and influence them to apprentice themselves to a really good firm, and any wishing to spread the knowledge of what is offered by the Gnome Company to their apprentices can obtain the following information and further details in pamphlet form from Peter Hooker, Ltd., of Walthamstow.—C. G. G.]

PREFACE.

As the value to a boy of a proper apprenticeship, and the effect it has on his future career and future earning powers, are not always fully appreciated by parents and guardians, the following may be of assistance to them.

The old and thorough system of apprenticeship which was in vogue prior to the last thirty years has been allowed to become slacker in nearly every trade, and especially in engineering. The result is that, taking into consideration the vast number of men who are engaged in the engineering and allied trades, it will be found that the percentage of those who have served a true and proper apprenticeship is very low, even amongst men who are styled "skilled" mechanics or artisans.

Instead of boys being properly indentured and bound to their masters, no sooner have they left school than they are looked upon by some parents and guardians, even at the early age of fourteen years, as capable of earning their own living, and are allowed to enter various walks of life at the highest wage they can command.

One often finds a boy employed in the office of an engineering firm perhaps earning 15s. per week, whilst the apprentice in the shop, who after his first year's experience should have become productive, is probably not earning more than 3s. to 4s. per week.

Again a boy becomes a machine-minder, gets onto piecework, and earns what are, to him, large sums of money, which immediately to his juvenile mind represents to *him* his value to his employer, with the result that he is not satisfied unless he is able to continue to earn that amount. Therefore, not being bound in any way to his employers he leaves them, and on the strength of his slight experience hires himself out to another firm as a journeyman. Being only partly trained in one branch of his trade he is prepared to give up that trade at once should somebody offer him a bigger wage in another occupation.

The effect of this laxity in the employment of boys in engineering works has become more and more noticeable during the period of the war. Owing to the necessity for increasing production, young lads of all descriptions have been able to obtain employment in engineering works simply as wage-earners, with little or no training or skill behind them, and with probably no idea of continuing in that occupation as their profession after the war.

The growth of this lax state of things decided Peter Hooker, Ltd., to look closely into the matter of their boy workers, and as the result they have decided that in future no boys will be taken into their works to do work of a productive description unless they are prepared to sign indentures and serve their time as regular bound apprentices.

To require the payment of a premium with an apprentice is to shut the door to many a promising boy who might become a good engineer, but whose parents or guardians cannot afford to pay a premium. The firm has therefore decided that whatever may be a would-be apprentice's social or financial position, they will not require payment of a premium. They have considered, too, the wages hitherto generally paid to apprentices, which are insufficient either to maintain an apprentice away from home, or even to assist his keep while at home. They have therefore prepared the new schedule of apprentices' wages printed in these rules, which is at least 100 per cent. higher than apprentices are generally paid. Further, they have decided to oppose no obstacle to an apprentice being allowed to work on piecework, when he becomes sufficiently proficient, which should enable him to test his own progress and give him confidence in his ability, besides adding to his earnings.

As punctual attendance is essential the apprentices will have the further benefit of any good time-keeping bonus paid by the firm to their employees.

Under the old systems of apprenticeship there was no responsibility on the boy's employers to continue the boy's general education during the first part of his apprenticeship, and to blend it with the beginnings of his technical and workshop education. This point has received careful attention, and it is provided for in these rules and in the form of Indenture adopted that the apprentices will be required to attend continuation classes for both general and technical education, to be arranged for by the firm, and that the necessary time to attend these classes will be allowed. The classes will be either those held by the various technical institutions in the neighbourhood, or classes held by the firm on their own premises.

The company feel sure that parents and guardians who are considering placing their boys in the engineering profession will, after reading the foregoing, and the Rules and Regulations for Apprentices which follow, appreciate and take advantage of the improved facilities for apprenticeship which the company are now offering, and the careful system of instruction which has been arranged so as to make the apprentice's general education and technical training as thorough as possible.

RULES AND REGULATIONS FOR APPRENTICES.

1.—COMMENCING AGE.—Lads should not be eligible for apprenticeship until they are 15 years of age. Any period worked in the factory prior to attaining 15 years to be regarded as a probationary period. Every lad before being apprenticed shall serve a probationary period of at least one month, during which wages shall be paid him at the rate of a first-year apprentice, but if such probationary period takes place after 15 years this period is to be reckoned a part of the apprenticeship.

2.—PERIOD OF APPRENTICESHIP.—The period of apprenticeship will be five years for those of 15 years of age, and for those above that age until they are 21 years of age.

3.—TIME-KEEPING AND GOOD CONDUCT.—The apprentice is required to attend the factory during the working hours, and to work a reasonable amount of overtime per week by consent (see Indenture). Apprentices will also be required to work in their turn on the night shift unless special arrangements are made with their parents for them not to do so. The apprentice will be held strictly to the terms and requirements of his indenture, and bad time-keeping and misconduct of any description will

penalise him from participating in any good-conduct prizes or privileges which may be offered by the firm for good conduct.

4.—Wages.—In order that it may be possible for all classes of lads to be bound apprentices, no premiums will be required, and apprentices will be paid wages on the following scale, the week being reckoned as 54 hours:

Any period of probation, i.e., before the age of 15 years, 6s. per week.

First Year.

If satisfactory.

1st 3 months of apprenticeship ..... 6s. per week.
2nd 3 months of apprenticeship ..... 8s. per week.
3rd 3 months of apprenticeship .....10s. per week.
4th 3 months of apprenticeship .....12s. per week.

Second Year.

After 3 months, i.e., 15 months' service.
14s. per week.

Third Year.

At commencement .....16s. per week.

Fourth Year.

At commencement .....18s. per week.

Fifth Year.

At commencement .....20s. per week.

The wages will be paid proportionately to the actual hours worked, the week referred to above being considered one of 54 hours. Should, however, the actual weekly working hours of the factory be altered, this figure will be altered to correspond. Any apprentice working on night shift will be paid according to the rules for overtime and night shift as worked in the shop.

Wages will not be paid for time, if any, during which an apprentice is absent owing to illness, other than that provided for under the terms of the indenture, that is to say, the difference between the National Health Insurance payment and his wages for a total period of six weeks in any one year.

5.—Certificates of Education.—All lads offering themselves for apprenticeship shall be required to present satisfactory certificates or other proof of a good general education, and in the event of their being unable to satisfy the firm they will be required to pass an examination at the works on their general knowledge prior to being accepted as an apprentice.

6.—Continuation Classes.—Apprentices will be required to attend continuation classes for both general and technical education as shall be arranged for by the firm. The period of attendance of such classes will be fixed by the firm, having regard to the standard of intelligence and industry displayed by the particular apprentice. Time will be allowed during working hours when it is necessary for the apprentice to attend such classes, and arrangements will be made for certain classes to be held in the factory itself for the attendance of apprentices. Certificates of attendance at the classes will be required in the case of any classes held elsewhere than in the factory.

7.—Record.—Careful record will be kept of every apprentice in the works both as to his behaviour, zeal, and advancement, and in connection therewith certain marks will be allotted by the works manager on reports from the foreman or other officials each week. Prizes will be offered to those apprentices who are in the same year, such prizes being given for the best reports received of the behaviour and general conduct, time-keeping, and attention to work of the apprentices.

It shall be open to any apprentice in his last year to compete for positions in the drawing office as vacancies occur.

Syllabus of Training.—The following is a syllabus of the training given to apprentices, which is divided into four grades, according to whatever aim the apprentice has in view when starting his apprenticeship. Each apprentice, or his parent or guardian, will be required to state when signing the indenture which grade the apprentice wishes to join. The following gives the probable result of each grade:

Sufficient training for a youth to become a qualified machinist.

Sufficient training for a youth to become a qualified fitter.

Training for a youth who intends to continue his studies in a drawing office. The youth should be at the end of this period an all-round mechanic.

For a youth who wishes to become a fully qualified engineer.

Departments in which Apprentice will receive Training.	1st Grade Apprentice. 5 years in Machine Shop only.	2nd Grade Apprentice. 5 years in Fitting Shop only.	3rd Grade Apprentice. 5 years in Machine and Fitting Shop Only.	4th Grade Apprentice. 5 years in all Departments
Small Tool Stores (Departmental)	3 months	3 months	3 months	1 month
Drilling	3 months	—	3 months	2 months
Milling, Shaping, Planing and Gear Cutting	15 months	—	9 months	9 months
Turrets and Automatics	15 months	—	9 months	9 months
Engine Lathes	15 months	—	9 months	9 months
Grinding	9 months	—	6 months	3 months
Fitting	—	33 months	15 months	9 months
Assembling	—	24 months	6 months	3 months
Electrical Department	—	—	—	3 months
View Room	—	—	—	3 months
Tool Room	—	—	—	3 months
Jig and Tool Drawing Office	—	—	—	3 months
Engine Detail and Design Drawing Office	—	—	—	3 months

Apprentices in common with the rest of the factory will receive a good time-keeping bonus of ½d. per hour on all hours worked provided that no more than half an hour is lost by the apprentice in any week. Also under the Awards of the Committee on Production a further war bonus amounting to 2s. 6d. per week is paid to apprentices under 18 years of age, and 8s. per week to those over 18 years of age.

AMERICAN INDUSTRIAL NOTES.

According to the "Air Service Journal," New York, of September 13th, the great appropriation made for developing the American Flying Corps is likely to go a good deal further than was expected, a very unusual experience with war appropriations.

It has been found that by reason of the great number of machines to be built and the standardisation of their parts to an enormous extent the cost of the machines will not exceed half the estimates. The American Government officials have high hopes that future orders may be fulfilled at about one-third the previously estimated costs.

One would like to know whether the contracts' department at the Air Board has experienced the same phenomenon.

* * *

Apropos the official announcement that more than 20,000 aeroplanes are now in course of construction in the United States, an additional official statement has been issued by the Secretary of War, which reports highly satisfactory progress.

Contracts have been allotted and work is in progress on the entire number of aeroplanes and motors for which £128,000,000 was provided by the Aviation Bill passed by Congress in July. The types of machines now in process of manufacture cover the entire range of training machines, light high-speed fighting machines, and powerful battle and bombing planes of the heaviest design. The contracts cover an ample number of training machines and embrace many giant battleplanes of a capacity equal to the Caproni, Handley Page, and similar types. The American forces in France will be amply equipped with aircraft.

[Quality as well as quantity is desirable.—Ed.]

The work of the aviation section is said to have been thoroughly systematised. The training of pilots, the building of motors, the construction of wings are proceeding uniformly, so that when the motors are ready the planes will be ready, and when the finished aircraft are ready the aviators and machine-guns will be available. Aeroplanes for the United States are being constructed both in America and abroad. Approximately one-fourth of the number immediately needed will be made abroad.

The United States to-day is in virtual control of many of the materials required for the manufacture of aircraft both for this Government and the Allies. Steps have already been taken for the conservation and distribution of such materials. The aviation service of the Allies may lay claim to "an international general staff" composed of more than 30 air service experts of the Allied nations now in Washington on regular duty with the officers of the American Army and Navy and the members of the Aircraft Production Board. It is said that the best 10 experts of the air services of the Allied countries have been lent to the U.S. Government in order to aid in getting the American aviation programme under way with the fewest possible mistakes and the greatest economy of time.

[One has not missed anyone of importance from England so far.—Ed.]

Thousands of Americans are being registered for flying. Several great universities are turning out cadets steadily. Twenty-four flying schools have been created. Arrangements have also been made with the Allied countries for the final training of American cadets on foreign soil. These men are being trained in American uniforms and will be turned over as finished aviators to the fighting forces in France.

[It is indeed satisfactory to be assured that the American air fleet is being built under such favourable conditions, and one awaits the result with interest.—Ed.]

KINDLY MENTION "THE AEROPLANE" WHEN CORRESPONDING WITH ADVERTISERS.

The Production of Aeroplanes and their Components

(*Seventeenth Instalment.*)

BY STEPNEY BLAKENEY.

Storing Finished Parts.

The wings, ailerons, tail plane, elevators, etc., having been received from the dope shop into the finished-part stores, they can here be examined and passed by the inspector. If suitable accommodation and room is available, the wings can be conveniently stored in racks in a horizontal position, the racks being double-sided, preferably fixed with a walking space all round.

In this way the top right and left-hand planes can be stored on one rack, and the bottom right and left-hand planes can be stored in another rack. Thus quite a large number of wings, elevators, or tail planes can be stored in a small space until required in the erecting shop or for dispatch.

Similar racks are useful in the dope room to store planes when a large number are being pigmented or varnished, whilst they are drying. It is far preferable to keep the planes in racks instead of leaning them in piles against walls or partitions, where they are liable to be damaged by people's feet walking by, besides scratching the edges and distorting the wing, owing to it being improperly supported.

A Parts Assembly Shop.

In all works a shop situated conveniently near to the erecting shop should be provided. This shop we can assume for our purpose to be about 30 ft. square, with two narrow benches along the walls, opposite to each other. About five pairs of trestles, with 3-in. by 2-in. rounded bearers, sufficiently long to support the whole length of the wing, should also be provided.

In this shop, on the walls, a few small bins for holding the external fittings in can be fixed up, and if possible a small electric portable drill for drilling pin-holes. Into this shop all wings, elevators, ailerons, etc., can be brought to have their external fittings put onto them. To many managers this may seem an unnecessary sub-division of the erecting shop duties, but it will be found to save time, decrease wasted room in the erecting shop, specialise labour in their work, facilitate cost-keeping, expedite the erection of complete machines, lessen the labour and supervision of the erecting-shop foreman, centralise responsibility for perfect work, and generally speed up output. So it seems worth while.

The Comfort of Workers.

Further, the bulk of the work can be done by one man, assisted by about six intelligent girls, who, if they are at all suitable for the work, easily pick it up in about a fortnight, especially if conditions for work are comfortable. There should be plenty of air, light, and reasonable warmth, which is as necessary for the planes, etc., as the workers.

There are some people who say, "work, and keep yourself warm." This is possible if you are shifting and erecting heavy steelwork, digging a hole with a pick and shovel, or, better still in cold weather, firing a marine boiler; but aeroplane work does not happen to be similar to any of these blood-circulating occupations. In many cases it requires a certain amount of delicacy of touch and care and patience, none of which qualities contribute to warmth.

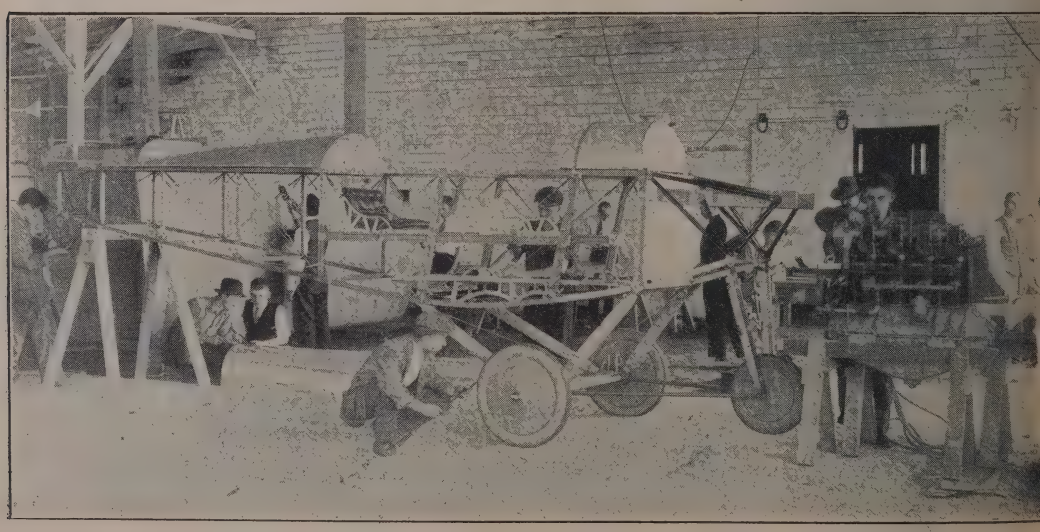
Therefore, it is as well to give attention to the subjects of air, light, and warmth, as it is quite possible for a large shop full of workers, say a hundred, to spend twenty-five per cent. of their time in thinking how cold it is. To estimate the cost of this occupation, ask them to book a quarter of an hour every hour to this on their time sheets, and then ask the cost office for the account at the end of a week.

The wings, ailerons, tail planes, fins, rudders, etc., can be brought into this assembly shop to have their external fittings attached. The wings, for instance, require their lift plates and eyebolts put on and split pinned, and the spar brackets or other hinges attached. In fact, an immense amount of incidental yet important work can be done here, thus saving a large amount of room required for whole machines.

Erecting the Machines.

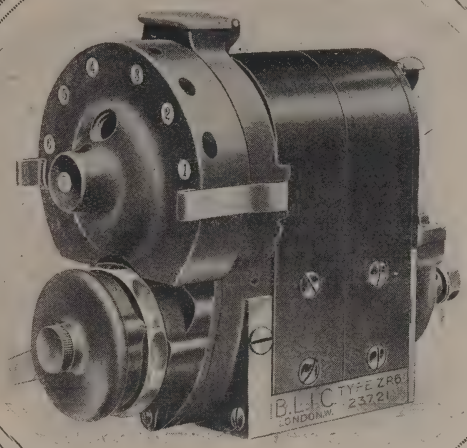
The complete erection of the aeroplane has now to be considered briefly.

We can assume that the fuselage skeleton is complete; this will be put on two trestles in the erecting shop, and the trestles should have some simple form of adjustable head, so that the height of the work on them can be varied. This is essential especially in this instance, as the under-carriage has to be fitted onto the fuselage, and it is handy to be able to raise or lower the fuselage without having to look for a few pieces of loose wood. These do not invariably form a solid packing for the fuselage such as is required to enable the fuselage to be held in a horizontal position.



Accessories in the Erecting Shop.

The under-carriage having been attached to the fuselage and all the bolts put in and split-pinned up, the axle can be put into its position. The shock-absorbers can be then wound on and the aluminium streamline fairing attached. It will not be advisable to put on the wheels until the machine is practically finished, as the tyres deteriorate, the covers get dirty and frequently torn and everybody makes footsteps of them. Therefore, a pair of small wooden Vee trestles should be made, into which the bearing-ends of the axle can rest.



As a considerable amount of work will have to be done which involves the workers being about eighteen inches above the floor level, it would save a considerable amount of waste of time and litter of old boxes kicking about the shop if a few 6 to 8-ft. forms are made for the workers to stand on.

Preliminary Fitting.

The next thing to do will be to fix in the tank bearers and

IN AN AMERICAN AIRCRAFT FACTORY.—The Lawson Aircraft Corporation's Assembling Shop. The fuselage stands on concrete T, presumably for purposes of levelling, and the various other components, such as wings and engine, are evidently assembled in its immediate vicinity. The shop appears to have a "dirt" floor, which will probably create dust.

British—and Best!

B·L·I·C

THE BRITISH LIGHTING & IGNITION Co. LTD.

Built in a British Factory by British workmen, with a unique experience of magneto manufacture, the "B.L.I.C." embodies every scientific principle in design and manufacture. It is the most reliable magneto yet produced—British or foreign.

At present our works are entirely engaged in meeting the requirements of the British and Allied Governments. We trust, however, you will specify the "B.L.I.C." Magneto for your post-war requirements.

The BRITISH LIGHTING & IGNITION Co., Ltd.
(Proprietors: VICKERS, LIMITED).
204, TOTTENHAM COURT ROAD, LONDON, W.1.

prepare for the reception of the tanks for the petrol and oil supply. As soon as these are fitted, it will be as well to put in the instrument board so that instruments can be set out in their respective positions and screwed into their positions after any necessary cutting and fitting has been done.

As soon as they are in position the coppersmiths should be detailed off to fit in the copper pipes and bends from the instruments to the tanks, at the same time the installation of the controls can be commenced, the rudder-bar being fixed in position, and the "joy-stick," or control pillar, for working the aileron and elevator controls.

Having put these in, the streamline fairing on the fuselage can be fitted. In some machines this is an independent unit in one piece, in others, it is built up on the fuselage in skeleton form and covered with fabric, which is afterwards doped and varnished. Also, the fuselage will be covered round with fabric, which is stretched on and tacked to the longerons, and the tacks finished off or covered over with a small half-round beading.

FIXING THE TAIL.

The tail plane can next be attached to the fuselage, but before being finally fixed in position it must be tested to see that it is fairly and squarely at right-angles to the longitudinal centre-line of the machine. This can be done with long trammel points or a steel tape, and measuring from the left and right-hand tips of the tail plane to a fixed point on the centre-line of the fuselage; this must be dead right and an equal measurement on either side. Differences, however small, cannot be permitted, and all necessary alterations must be made until the dimensions are accurate.

ENGINE FITTING.

For the moment, as most work is being done at the tail-end of the machine, it may be considered a suitable time to lift the engine into position, but before lifting it in it is necessary to secure the tail of the machine in some way to the floor, either with ropes fastened to temporary cleats screwed to the floor, or some heavy weight. Unless this is done the machine will tilt up when the engine is installed, as the weight of the engine is considerable.

It is not advisable to expect the engine erectors, either with or without help, to lift the engine into position. The lifting should be done with a half-ton worm-geared chain tackle, and some good, reliable 1½-in. rope, and a couple of stiff bird-mouthed bits of wood to put between the rope slings to prevent them from bending or breaking various parts of the engine or chafing or cutting themselves. Also, incidentally, it is advisable to attach the tackle to something which is capable of standing at least double the weight of the engine. Gas pipes and electric conduits, or coat-hooks, should be considered out of bounds, and may be neglected as anchorage for the lifting tackle.

(To be continued.)

ALLOWANCES FOR BENDING SHEET METAL.

By RANDOLPH F. HALL.
Of the Thomas-Morse Aircraft Corp.

It is an important point in the design of fittings to make correct allowances for bends in sheet metal. The writer, together with B. D. Thomas, has carried out a number of measurements on bends round a 1 in. square bar, and the results are embodied in the chart of Fig. 1, on lengths measured along the neutral axis.

A number of strips, 18, 16, 14, and 12 gauge sheet-steel, were bent over a 1 in. square steel bar, with corners rounded in each case with the radius equal to the thickness of the metal. Had no allowance been required for bending, the ends of the strip

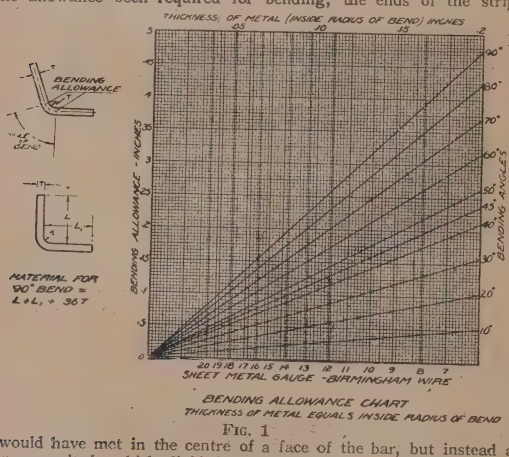


FIG. 1

would have met in the centre of a face of the bar, but instead a gap resulted, which divided by four gave actual allowance for one bend. The allowances required per bend were between thirty-three hundredths and thirty-eight hundredths times the thickness of the metal, and the mean of ten different tests confirmed the allowances computed on the neutral axis. From these experiments the curves of Fig. 1 were deduced, allowances for angles less than 90 deg. being made proportionately.

Results in the factory verify the chart. If the corners are hammered flat, less allowance is required, but the fitting is weakened.

AUSTIN AMBULANCE STATIONS.

From the Austin "Advocate":—

Accidents are unavoidable in any works; the present high pressure tending to greater frequency, but, fortunately, the cases are mostly minor. If the output is to be kept at the required level, the health of the worker must be cared for. Hence all ailments and accidents must have instant and satisfactory treatment. To ensure this attention Ambulance Stations, having separate rooms for men and women, are provided. They are adequately fitted with the necessities for the work carried on: there is in each section a rest room, with couch, etc., where a worker may remain in quietness for a period of recuperation. Its obvious advantages were prominently brought to the writer's notice recently in the case of a girl subjected to heart attacks. One such seizure had overtaken her on the day in question, and recovery was greatly assisted by the accommodation available. Without it, she would have had to go home, and the whole day's work would have been lost.

All the other requirements for an up-to-date Ambulance Station are here, such as electric sterilisers, medicine cabinets, stretchers and emergency first-aid boxes. These latter being fitted with every requisite for rendering first-aid are indispensable in the event of a serious case which it is inadvisable to move at once to the dressing station.

Properly qualified nurses, male and female, are on duty both day and night and are kept fully occupied. It would seem that bruises and ailments run in epidemics: one day there is a run on cut fingers, the next on toothache, and so on. Rarely is the station without a patient, and, apart from the practical work to be done, there is a certain amount of clerical work, as a record of all accidents and their treatment has to be kept.

The stations are periodically inspected by a local physician, who advises as to the best means of treating cases, the proper material and apparatus to use, and so on. If a very serious accident happens, the unfortunate person is sent to hospital with the greatest possible speed, there being an excellent motor-ambulance service, set aside exclusively for that purpose.

A very noticeable feature of this section of women's war work is the enthusiasm of the nurses—keenness being the keynote of it all. "I think ambulance work is fine: I could bandage all day without being tired," said one very busy worker, and she continued, "We profess to cure every ache except heartache, and the other day we even cured that with a dose of 'Salvolatile'"—so much for "*la grande passion.*"

These scraps of conversation serve to show that those essential characteristics of a nurse, cheerfulness and a ready sense of humour, are so much in evidence even under the stress of their duties, and it is a gratifying feature to find that an Ambulance Station is one of the pleasantest and brightest, although, unfortunately, one of the very busy departments in the works.—(Miss) A. McG.

WAR WORK FOR WOMEN.

In addition to the 10,000 women which the War Office notified to the Employment Department as being required by the end of October, large numbers are wanted for work under the Royal Flying Corps. These women will be required to work in the aircraft repairing depots, both at home and in France. The numbers notified as being wanted immediately by the Royal Flying Corps are: 144 fitters (general machine and turners), 52 instrument repairers, 20 acetylene welders, 37 electricians, 12 draughtswomen, 55 painters, 2 tracers, 145 storekeepers (Class I.) (these women are required for technical stores, and should have a knowledge of engine parts and tools), 503 sail-makers for work of making and repairing aeroplane wings (for this purpose good needlewomen who can also use sewing machines are wanted). In addition tinsmiths, coppersmiths, and tender drivers are wanted. All applications should be made to the Employment Exchanges, where full information will be supplied.

AERONAUTICAL RESEARCH.

The Industrial Research Committee of the Board of Education have made a grant to Professor G. H. Bryan, F.R.S., of the University College of North Wales, which will enable him to devote the whole of the next session to the carrying on of aeronautical research of national importance. In the first instance Professor Bryan proposes to carry out the work at the University of Bristol.

MARKET REPORTS.

Prices given are for quantities on usual terms.

Oct. 11th, 1917.

COPPER.—It is reported that the U.S. Government intend exercising a very strict control on Copper by prohibiting supplies for any purpose other than the fulfilling of orders of national importance. In view of the threatened shortage of this metal, the step is certainly justified, and should be welcomed by the Allies. There is a slight improvement in output, but nothing worth speaking about, and there does not appear to be any indication of the labour troubles being settled.

Since the last report Copper Sheets have been reduced £4, and B.S. £5; it will also be observed, upon reference to the Prices Current List, that the recent reductions in Copper prices have naturally affected the prices of Copper and Brass Scrap.

Comparative Prices.

To-day	£110	0	0	per ton.
Last Month	120	0	0	per ton.
Last Year	120	10	0	per ton.
Average, 1916	116	1	3	per ton.

TIN.—The Tin market appears to have been a little steadier recently; this may be due to the large shipments which have recently been received, and further quantities being on the way.

A very fair business has recently been done, although there appears to be a reluctance to sell material forward.

Comparative Prices.

To-day	£244	10	0	per ton.
October 8th	£244	10	0	per ton.
October 4th	245	10	0	per ton.
October 1st	243	10	0	per ton.
Last Month	241	0	0	per ton.
1916	177	0	0	per ton.
Highest Price, 1916	205	0	0	per ton.

LEAD.—Official prices remain unaltered and supplies are being well maintained; the demand, however, is continually increasing and a very strict control is being exercised, so that it is impossible to obtain supplies for domestic purposes.

STEEL.—It is still doubtful whether orders for Steel will be placed with America. There is a margin between prices prevailing here and U.S.A. prices; at the same time there does not appear to be any reason why contracts should not be fixed up, if there is a possibility of the works giving delivery in addition to the U.S. Government contracts.

The demand here for all classes of Steel is reaching a colossal figure and manufacturers are finding it impossible to cope with the demands made upon them; as stated in previous reports, tremendous efforts are being made to effect substantial increases in the output; nevertheless, consumers are apparently booking their requirements well ahead, and, in view of the prevailing difficulties, this is certainly the wisest step to take. The Air Board are steadily increasing the output of Aircraft Steels, and supplies are fairly satisfactory.

There is still an acute shortage of H.S. Steel, and it is now becoming increasingly difficult to obtain Cast Steel. Supplies of Sheet Steel are not as easy to obtain as they were a few months ago. One presumes the Air Board are not losing sight of the fact that the demand for this material is increasing proportionately with other Aircraft Steels and are accordingly arranging for the output to be increased considerably.

TIMBER.—Supplies of Silver Spruce are still very scarce although one or two shipments are occasionally received. There is an apparent rush to book contracts for the Silver Spruce substitutes; official instructions do not, however, appear to have been issued; furthermore, it is more than likely that the Air Board will buy the quantities required by the whole of the factories and instruct contractors to apply to them for supplies, notwithstanding the "Silver Spruce Muddle"; however, they have probably learned a valuable lesson.

It is still difficult to obtain substantial supplies of Walnut and Mahogany, and the requisitioning of all stocks of the latter by the Timber Controller was certainly a wise step.

FABRIC.—It is very difficult to see what will be done if the authorities do not settle the Irish strike very quickly. The delay does not improve the situation.

CURRENT MARKET PRICES.

Oct. 4th, 1917.

The prices given below are the prices ruling on the above date.

TERMS.—Usual for the various materials mentioned.

Prices of old metals are as quoted by scrap dealers.

Prices must not be taken as specific quotations for definite quantities delivered to any part of the country.

AUTOGENOUS WELDING (Continued).

An Old Principle Reversed.

Let us now see exactly how these briefly-stated but far-reaching results were obtained by the then new oxy-hydrogen apparatus. The fact was evident enough that the molecules of oxygen and carbon-free combustible gas, completely mingled, duly arrived at the nozzle, in the very flame-pip itself, in the desired proportion and ready for complete mutual combustion.

But how was an immediate explosion of such a detohative mixture avoided? Simply by doing what no one had hitherto thought of—physical results again—giving it a velocity greater than that of the propagation of the flame. In other words, crowding the supply volume wholly out of proportion to its capacity to escape from the jet.

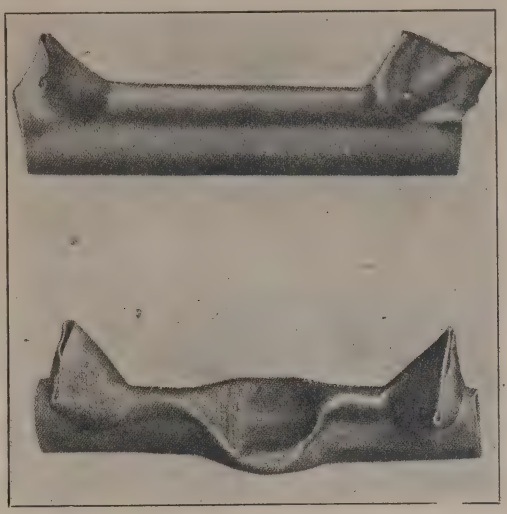
It is distinctly the French and not the English way to examine the visitations of Providence to see whether they can be usefully employed, instead of merely bewailing them. So, although the French commission on fire-damp really discovered nothing more than had been established years before, by the invention of the Davy lamp, they went into the phenomena involved in a more mathematical fashion, and not only affirmed the fact that a detonative mixture if enclosed in a tube—the converse of the Davy-lamp principle—does not take fire instantly throughout its mass, but found that if it be lit at one extremity of the tube, the flame progresses in the tube with a speed increasing as the square of the section of that tube. If then, the gaseous mass is driven in the opposite direction—that is, towards the point of ignition—at a greater speed than that of the flame propagation—easily calculable beforehand according to the tube-diameter—the flame cannot enter the tube.

Thus the application of this principle to the blowpipe was the simplest affair. It only needed someone to think of it.

However, the granting of patents in all countries to the Société Oxyhydrique showed that the most stringent examination—in some of them at least—established the novelty of this simple thing as embodied in the said blowpipe. Since which, year after year of successful use without a single accident recorded, confirmed its practical qualities of safety; homogeneity of the flame, and easy regulation. Altogether the light, simple and economical blowpipe—in its three types designed for the different kinds of metal according to their greater or less fusibility—which the Society were thus enabled to offer to general manufacturers, boiler-makers, founders, etc., got at a stroke as near perfection as one could reasonably wish.

The Defect and the Remedy.

But as introduced at first, when its use became from then extended to the welding of greater thicknesses of sheet metal, the employment of blowpipes with the larger nozzles required gave trouble. For instance, it frequently occurred in practice—chiefly when using a strong supply of gas, that some accidental happening checked its velocity. Most frequently, if the workman brought the blowpipe nozzle too near the weld in progress; or if he trod on one of the rubber pipes, or if the regulator did not work quite right—then the flame-speed at once became greater than the gas current, and a blow-back occurred. Under the old system one was obliged to drop everything and cut off the supply to avoid melting the blowpipe forthwith, or at least charring the tubes to destruction.



For this reason, the safety mixer was invented. This consisted simply of a funnel-like chamber, fitted at one end with a Y-shaped double tube, one arm for the hydrogen and the other for the oxygen supply pipes, while the other end of the tube, tapered to take a delivery pipe, connected up with a single rubber lead to the blowpipe. Actually, this same thing was modified to form blowpipe and mixer combined, for the Nos. 1 and 2 types, for lighter work.

With this new device, however, if a back-fire occurred in the blowpipe—as will happen—no harm resulted. Combustion stopped instantly, the jet automatically extinguished, and then it was sufficient for the gas-flow to continue as before for the jet to relight as automatically as it went out, from the mere heat of the weld. Altogether the blow-out lasted less than two seconds, not even interrupting the progress of the weld.

Also, not only did the elimination of one of the rubber tubes make the handling of the blowpipe more convenient, but the mixture of the gases was more thoroughly effected and the consumption was notably reduced. So that the employment of oxy-hydrogenous welding at once became practicable for many sorts of work for which it had hitherto been over-difficult.

Various Types of the Blowpipe.

Still, the combination type with its two-way supply had its uses for low-temperature work, as, for instance, the making of seams and joints in lead, brazing copper or brass, or light mendings of any kind. For then one could—and it is the better way—substitute ordinary town-gas for the hydrogen. This latter being, however, usually supplied at a light pressure, in this type of blowpipe the oxygen pressure is made to inspire the town-gas at a greater velocity; practically to suck it in at its own speed.

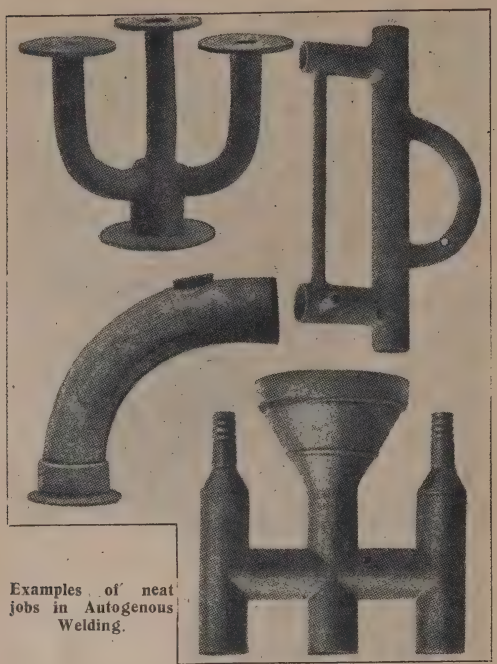
Showing how a good Autogenous Weld holds together.

This type of blowpipe is simply the mixer, tapered more sharply, and curved at the small end, so as to take any one of the brass nozzles usually supplied. It contains no baffle or gauze funnels, or any other appliance such as is found in other blowpipes, all of which, for that reason alone, are mostly dangerous, or at least inefficient.

The No. 2 type is practically the same, but is designed for any work requiring a temperature only slightly higher than that of the hydrogen flame. It merely contains, however, to regulate the hydrogen supply, a little balance valve, actuated by the oxygen pressure.

No. 3, on the other hand, is the general purpose type with the single delivery tube to the blowpipe itself.

The rest of the apparatus for the complete portable outfit requires little description. Each container—which should be painted white for oxygen, red for hydrogen—has two dials, one a manometer to show the pressure existing in the container at any given moment—and thus the amount of gas remaining—while the other is the indicator, showing the rate of supply in litres per minute: and thus acts as a regulator indirectly.



The Apparatus and Its Use.

Naturally it is impossible to indicate, even broadly, the volume to be used for any piece of welding, as that depends solely on the work itself; the thickness of the sheet, the shape of the piece to be repaired, the quality of the metal, and a dozen other conditions on which experience only can decide. Usually, however, a general indicator-chart is supplied—the Société Oxyhydrique used to give one—which narrows down the question within fairly close limits. The only thing is that the supply, be it greater or less, *must be equal* from both containers. But it will be seen that, apart from the varying diameter of the nozzles, one can regulate the size and temperature of the flame absolutely: a thing impossible in the case of acetylene, in which the regulation is fixed to one volume, and, therefore, size of flame for all kinds of work: hence the obvious impossibility of doing sound welding in more than a few kinds.

Just as much as a painter can tell you exactly how to paint a picture by taking a brush in hand, dipping it in this or that colour, and smearing it on the canvas, can I tell you how to use the oxy-hydrogen blowpipe. Or can anyone else? The pip of flame will be anywhere from ⅛ to ¾ of an inch long, according to its regulation for the job, by nozzle or at the container end. But the coloured spot or *grain* in it should be about ⅛ inch down from the actual nozzle exit. Keep it so; and the full length of it—not less—down on the metal. Thus you will get the flame at its best heat.

Some very General Directions.

Take the blowpipe in the right hand—if it be your less clumsy one—and in your left a rod or wire of the metal of the same kind—and in the case of steel, the selfsame composition and temper—but otherwise of a little better quality; a closer grained finer iron, for instance. Do not, however, succumb to the temptation of holding the blowpipe like a pen. Grip it in balance as near as you can, *not* with the tips of the fingers like a fiddle-bow, but more like a billiard-cue. And to proceed with these preparatory hints, do *not* wear violet glasses or any shade approaching violet. If you do, the rays will irrevocably destroy

Examples of neat jobs in Autogenous Welding.

your optic nerves. Even to use such glasses once may start the trouble. Dark smoked ones, of about a dove grey shade, are the best. They should have gauze sides, as sparks will fly from the best regulated weld. Preferably, too, for your sight's sake, curved glasses, rather than flat.

You are now—assuming the job beforehand to have been made ready, as it is not—about to begin. Now, having opened the valve of the hydrogen container first, screw back the regulator-piece until the needle of the manometer shows the output indicated on the chart for the particular job. Then do the same for the oxygen: assuring *equal supply*. Next, turn the hydrogen supply tap: and *then* the other for the oxygen to the *same* extent: and you will have set the flame in true proportions. For other work, or to stop work, shut off the gases. But in doing this, shut off the oxygen first.

In the case of No. 2 type of blowpipe, for which the town-gas supply is used, observe the same order of opening and closing off Not only must the combustible gas fill the blowpipe and take the lead, but it is only by gradually regulating the oxygen supply that you can get the appropriate volume—and *the right flame-colour* therewith—for the work in hand.

An indispensable accessory is a wiping pad. This should *not* contain emery, or be in any way like a pincushion. Nor should it be of cork or any other quick-charring—and carbonising—material at all; or the nozzle, instead of clearing, will take a taint from it. Nothing is better than the upturned sole of an old boot, nailed on a corner of the table—which should be a wooden, *not* a slate one—and kept wet.

Preferably—always, indeed, if the work allows—stand the two containers on end, side by side, the oxygen one next to yourself. To make sure of their safety, tie them securely to any convenient post, pillar or wall fastening; and on your left hand, as you may need to make some little adjustment during the weld. Only, keep them well clear of the table.

Now you are in position to begin, at any rate: have all your material, and at least know how to hold it. But—you have now to make ready the parts to be welded; which is half the work of a successful welding job.

DE GUSTIBUS NON——.

None of us can avoid his likes or dislikes: equally, none can afford to have any prejudices, at any rate, in technical matters. The one is—or should be—founded on exact evidence with experience to back it: the other is founded—if at all—on anything else: interest, ulterior motive, what you will: and judgment thus based is worthless. Let me therefore disclaim the slightest prejudice against any other variety of autogenous welding than by oxy-hydrogen and its variations.

If it were chemically possible, and anyone brought me a process employing any other two gases that left no chemical defect in the metal, and did the work ever so little better, or merely between a wider range of temperatures, that process I should at once prefer to the oxy-hydrogen process, the moment I had personally tested its claims. Even if its use necessitated an entirely different and special or costly blowpipe or apparatus. That, I should regret; but still, nothing less would be good enough for my work. I could not be so dishonest to my craft, to anything I made, or to myself, as to choose anything less efficient.

THE EVIDENCE-IN-CHIEF.

Yet failing anything of the kind, I merely like oxy-hydrogen welding—albeit, I admit it takes a lot of management at first—solely upon the undeniable technical evidence. First, because it puts no taint in the weld: there is nothing in hydrogen but hydrogen, and the oxygen, equally pure, is merely the combustible factor. Secondly, because, while its temperature can go up to 2,250 degrees—some practitioners say more—and is thus above the melting point of all metals except the as yet unisolated silicon, it can, by regulation of the mixture output—*not* proportional variation—be brought down to that of quite soft metals: or as had been said, by substituting town-gas for the hydrogen, to a heat no greater than is needed to make a lead-pipe joint.

On the other hand, there is acetylene. Useless to deny the evidence of its value, as displayed in those exquisite repairs of broken crank-chambers, gear-boxes, even cylinders, and all sorts of things which, mark you, are stationary, container-members rather than stress-members or, if subjected to any stress at all, sustain only a light and constant one. Pieces, notice again, in which it does not matter if the carbon content be considerably increased: in which, indeed, that increase may even be an improvement, which is quite conceivable from the standpoint of metallurgical chemistry. If so, say I, go ahead and use it preferably to oxy-hydrogen.

Notice still further, how marvellously rapid these repairs are. How, indeed, these feats of rapidity are justifiably advertised. Bethink you then what does that point to but the rapid attainment of a sharp, high temperature: with time consequently saved, perhaps 50 per cent., even if you include appropriate warming up beforehand and slow after-cooling; all done—as I am sure they are by these specialists—with the utmost care.

THE AEROPLANE ASPECT.

Very well, but see now the chemical evidence. Look at the comparative density of acetylene as to hydrogen. Does not that fact alone assure, upon the same volume, a much higher number of British thermal units? Is it any wonder that the flame hits up at once to 3,000 degrees? Is it not correspondingly certain that you cannot, on such a caloric output, get the temperature much lower, if any, and keep it as a working flame at all? Here is no special pleading: merely the statement of evidential fact. There

BEARDMORE
AERO ENGINES

"BEARDMORE"—a name famous throughout the world of engineering.

This historic name on AERO ENGINES is a guarantee of general excellence and highest possible efficiency.

THE BEARDMORE AERO ENGINE LTD.
London Showrooms and Depots:
112, GREAT PORTLAND STREET, LONDON, W. 1.
Telephone: Gerrard 238.

C.D.C.

is the secret of your quick repair of precisely such and such a kind or grouping of pieces. For such, I would not, therefore, look for a better.

Yet if you will excuse my discriminating, that kind or grouping, that variety of pieces, I do not find in aeroplane work: except, perhaps, in some hard-battled crank-chamber. I would not trust any defective cylinder to be mended at all, if it belonged to an aero-motor, by this oxy-hydrogen or any other process. On the other hand, I see all sorts of bearings and copper-smith work; all kinds of stress-pieces of most vital importance made of steel of all degrees of mildness: selected for special elongations, tensilities, temperings, compression-strengths and what not, in the cold: all of which must positively not be varied one iota in the making up: certainly not by 0.001 per cent. of any chemical added or subtracted.

Some Comparisons.

And then I regard the first essential of autogenous welding for all such work; which is that the flame temperature must not be allowed to exceed by more than a very few degrees the melting point of the metal under treatment, unless you would have it rendered brittle. Can I then reasonably be asked to work with a flame that not only contains carbon and possibly phosphorus, but that must exceed by 750 degrees the melting point of any metal bar that one?

Therefore, for such work, the oxy-hydrogen for mine! Slower? No doubt, a little. The remedy is, a bigger bay and more blowpipes for the same output of parts to which you can faithfully honestly entrust the lives of better men. More costly? I admit, neither oxygen nor hydrogen are cheap; but the quality of the work they do is cheap at any price; and actually, unwastefully used, it is astonishing how they last out. And what with the hardiness and simplicity of the plant, I doubt if, in the long run, there is five per cent. difference in the expense.

And Aviation Uses.

I could give quite a series of expensive photographs to show the difference of the work done by one process and the other: but that I see no good in creating a prejudice against one process so manifestly employed out of its appropriate job. But for oxy-hydrogen, I will say that I see nothing metallic on or about the present marvellous constructions called aeroplanes that it will not reliably fit: and when the chiefly-steel or truly all-metal type becomes standard, I see its uses increased tenfold.

I have neither actual experience nor judgment sufficient to say whether a sheet-steel seamlessly-welded petrol tank would, or not, be better than a lip-seamed copper one. My opinion on that point would be prejudice. I simply offer then the comparison of the atomic weight and tensile strength of sheet steel and sheet copper. I do not even know for certain by what process the seamless steel petrol barrels of one well-known firm happen to be welded. Suffice it for me that they *are* steel, and manifestly autogenously welded. Draw your own conclusions.

General Purposes Considered.

Now as to the sort of general work the oxy-hydrogen process of autogenous welding is fit for. Take cast-steel, the use of which is so general in the basal or body parts of machine-tool construction, etc. These parts betray—how often, only after a breakage has occurred or much work been done upon them?—all sorts of little defects, blowholes, cracks, etc. Nothing is easier than to repair them with the blowpipe where they stand. In fact, it is better not to dismount them, as they will be held up, naturally, in the best possible position for the repair.

It is sufficient to clean the edges of the crack or open the hole with a scraper; and then run in the metal from a wire of the same sort of steel. Heat up slowly, but do not run in the metal until the part is white hot, or, better, just running at the edges, in fact. Cool off slowly, of course, with a lessening flame; and while the mend or weld is still in a doughy condition, hammer lightly and very rapidly with the lightest of hammers: and even so after the whole "heal-up" has been reconstituted solid, it is well to give the part a second light re-heating to harmonise all interior molecular tensions. Which, for the sake of economy, had better be done with the No. 2 blowpipe, using town-gas.

Similar defects will, of course, occur in the much more delicate and costly bronze castings of all sorts; so their repair in the same way—much cheaper and more rapid than recasting—is even better worth while. Likewise, the finer pieces of aluminium casting.

Boiler Work and the Like.

Needless to say, oxy-hydrogen welding has revolutionised boiler-work; and now that it seems as if—able to afford petrol only for aviation and the cars of the Air Board, and coal-gas for the mercantile plutocracy—we others would have to use coke-fired flash-boilers for our automobiliary occasions, so that the most beautifully supple of fluid pressures, white-hot steam, comes to its own, one can readily see a recrudescence of all sorts of ideas and models in flash-generator manufacture; in which oxy-hydrogen autogenous welding will be the whole box and dice, team and dog under the waggon. Imagine the certain indestructibility and strength of a tube joint, expanded into a header, and then, not merely swaged, but welded in solid with that same!

Now, too, that the kitchen-range has been found out as the coal-hog it is, with the appetite of an ocean-liner, and there are to be no servants left, think of the ideal homes to be created by the patent stoves seamlessly welded, that cook a several course meal with a single gas-burner concealed in their midriff!

The Knell of Brazing.

But these prospects apart, where we used costly copper smithery for all sorts of pipework, we shall use various drawn steel tubes, the shaping and joining of which in collars, curves, elbows, bends and T or + pieces, can all be done rapidly *and* soundly, with the oxy-hydrogen blowpipe. And where we must use copper or brass tubing, we can displace brazing, and gladly. How many explosions have been caused by the slow perishing of the brazing owing to the voltaic couple set up by the presence of zinc and copper in chemical contact?

For the brazing thus transforms the copper at such a joint into a weak spongy substance, because of the change of the zinc into an inorganic salt. What again, is the effect of the fatty acids of heated oils running through lubrication tubing, likely to be upon the brazed joints? Yet on a welded joint, none whatever!

Literally, there is nothing that cannot be done—apart from sheer machining of parts, which incidentally it helps to save—by autogenous welding. What can be done, as a sublimation of blowpipe craft, if an artistic outrage, I illustrate herewith: merely asking whether it could, imaginably, have been committed by any other process than the oxy-hydrogen flame. It was, however, committed, and exhibited, at Liège, just twelve years ago.

Truly, the whole of it is a matter of imaginative application, and practice without hope of ever attaining perfection. You may reach great facility, even eminence. Somewhere, perhaps, there exists a finer fiddler than Kreisler. Only, never forget, in autogenous welding, that "By *hammer* and hand, all arts do stand."

AN INTERESTING OPENING CEREMONY.

Unfortunately owing to Tuesday, October 16th, being Press day, and owing to almost the whole Staff of this paper being in one or other of His Majesty's Services, it was impossible for a representative of The Aeroplane to attend the interesting ceremony booked to take place on that day at the Whitehead Aerodrome, at Hanworth Park, Feltham. According to the elegant invitation cards sent out by Mr. Whitehead, Colonel the Right Hon. Sir William Henry Dunn, Bart., Lord Mayor of London, was booked to play the chief part. The Directors of Whitehead Aircraft (1917) Ltd., had been honoured by the consent of Sir William Henry Dunn, Bart., "to perform the ceremony of diverting the Cardinal Wolsey River by means of a Reinforced Concrete Inverted Syphon and formally Opening the Aerodrome."

One deeply regrets one's inability to attend the ceremony, which must have been as diverting to the happy guests as to the Cardinal Wolsey River. One has frequently seen formal opening ceremonies performed by the breaking of a bottle of champagne or such container of liquid mediums, but never yet has one seen a Reinforced Concrete Inverted Syphon used for the purpose. Recollections of the diversion caused on any stage by the importation of a syphon into the bye-play of the performance suggests dimly the possibilities of such a syphon as that used on this occasion. One wishes the Aerodrome and the Cardinal Wolsey River every success in their new mode of life.

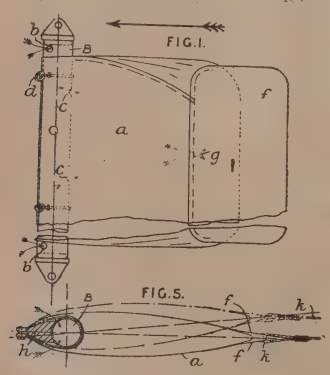
THE PATENTS INDEX.

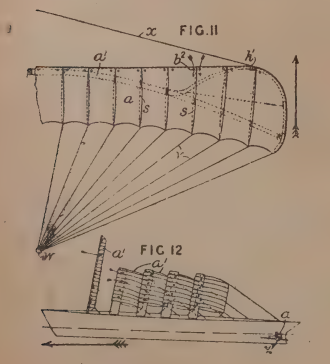
The subjoined list of inventions has been specially compiled by The Aeroplane from the current Official Patents Records.

Patent Applications.

Ayling, G., and G. J. Construction of girders, spars, struts, etc., for aircraft. No. 14490. Oct. 6th.
Bourke, A. M. Announcing movements of aircraft. No. 14435. Oct. 5th.
Burdick, C. L. Balloon light. No. 14263. Oct. 3rd.
Dunbar, E. Airships. No. 14454. Oct. 6th.
Fowler, A. H. Method of maintaining power of aero-engines at high altitudes. No. 14366. Oct. 4th.
Gordon, D. Machine for building propellers for aircraft, etc. No. 14131. Oct. 1st.
Grillet, L. Aeroplanes. No. 14265. Oct. 3rd.
Lefèvre, C. Airship. No. 14124. Oct. 1st.
Macgregor, A. A. Gyroscopic apparatus for steering aircraft. No. 14443. Oct. 5th.
Mond, A. Means for doping aeroplane, etc., fabric. No. 14126. Oct. 1st.
Prior, B. Propellers for aircraft and manufacture thereof. No. 14299. Oct. 3rd.
Prior, E. G. Struts, beams, poles, etc., and manufacture thereof. No. 14300. Oct. 3rd.
Ripley, H. Means for locating aircraft. No. 14214. Oct. 2nd.
Soper, J. M. Method of silencing exhaust of motors of aircraft. No. 14282. Oct. 3rd.
Southwell, R. V. Method of balancing automatic valves for airships. No. 14453. Oct. 5th.
Townsend, R. T. Time-indicator for use on aircraft. No. 14245. Oct. 2nd.
Tritsch, E. M. Speed, course, and stability indicators for flying-machines. No. 14325. Oct. 4th.



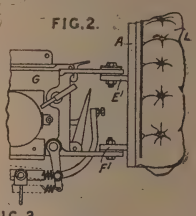
Complete Specifications Accepted, Prints of which can be obtained on and after October 25th, 1917.



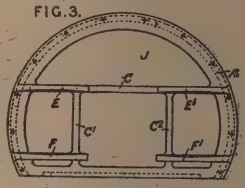
102,732. Dec. 11th, 1915. Le Bozec, L. Apparatus for feeding petrol, oil, or the like to engines or other apparatus.
109,905. April 4th, 1917. Caygill, F. J. Parachutes for use with aircraft.

Abridgments of Recently Published Specifications.

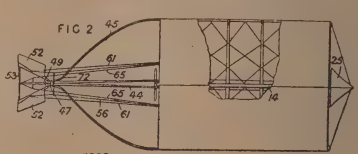
108,535. Aircraft, Marine Vessels, etc. Blackburn Aeroplane and Motor Co., and Sayers, W. B., Olympia, Leeds. Aug. 14th, 1916, No. 11447. [Classes 4, 25, 113 (i), and 115.]



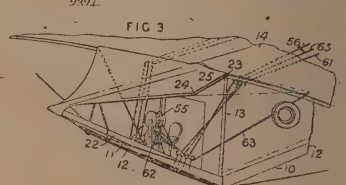
Resistance to propulsion, reducing.—In order to reduce to a minimum the resistance of airships, marine vessels, and other bodies moving through fluid, these bodies are provided with flexible envelopes which are capable of self-inflation during movement through the fluid so as to assume a streamline form. As applied to the strut or tube B, Figs. 1 and 5, of an aeroplane or airship, the envelope *a* is attached directly to the tube B by lacing *d*, or to a nose-piece *h* which is strapped to the tube B by straps so as to swivel thereon. When in motion, air passes through into the envelope which is thereby inflated. Strips *f* of fabric are sewn to the sides of the envelope and are joined, as shown, to form a tail. Holes *g* in the envelope are adapted to be uncovered by the strips *f* if the envelope becomes unduly distended so that air is allowed to escape. The envelope may be left free to take up its own form and direction in the wake, or stretching wires *k* may be attached to the tail to prevent or reduce undue flapping or fluttering. Fig. 11 shows the envelope as a flexible aeroplane wing *a* supported on a bow-like spar a^1. The fabric is retained at intervals in the approximate streamline section by partitions *s*, and is supported at the nose by wire *x* stretched from k^1 to a point near the body of the aeroplane. The rear part of the wing is stretched by cords or wires *v* to a point *w* on the fuselage or body. The openings for entrance of air are indicated at b^2. The stay or bracing wires of aircraft may be fitted with similar flexible streamlining envelopes. Fig. 12 shows the application of the envelope to the masts and funnels of ships, and to the brackets, below water, which carry the bearings of the propeller shafts *z*.

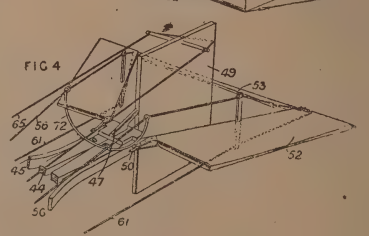


108,598. Wind or like Screens. Sopwith Aviation Co., and Sopwith, T., Kingston-on-Thames. Nov. 1st, 1916, No. 15620. [Classes 92 (i), 92 (ii), and 103 (ii).]



In order to prevent injury to the occupant of an aeroplane or the like by violent contact with the wind or similar protecting-screen such as is provided for use in sighting a gun, the glass screen J, Fig. 3, is surrounded by a frame A preferably of D-shape, having a padded cover or cushion L, Fig. 2. The frame is provided with horizontal and vertical cross-bars, C, C^1, C^2 having lugs E, E^1, F, F^1 by which the frame may be secured to the end of a gun G.





108,625. Aeronautics. Johnston, B., Quarters "C," Mare Island, Vallejo, California, U.S.A. Dec. 14th, 1916, No. 17969. [Class 4.]

Aerial Machines without Aerostats; Planes, construction of; steering and balancing; Cars.—An aeroplane comprising a main plane mounted above the body and having an elevator and rudder carried on rearwardly-extending spars has a triangular plane in front adapted to be turned about a longitudinal axis in conjunction with movements of the rudder. The floor 10 of the cabin has a forwardly-sloped triangular portion 11, and side flanges 12 for attachment to vertical members 13. Struts 22 support the outer end of a backbone 14 on which is pivoted a spar 23 stayed by wires 24 to the front on the backbone 14 and covered with canvas 25 to form a plane. Lateral members 45 extend rearwardly from the edges of the main plane and are bent to meet members 44 extending from beneath the cabin. A rudder 49 is pivoted about an axis 47, and an elevator consisting of two members 52 connected by a rear spar 53 is pivoted at 50. The elevator is operated by cords 56 passed through eyes in a member 72 and by cords 61, both cords being led over pulleys to a drum 55 mounted on the sloping portion 11 of the

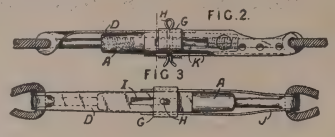
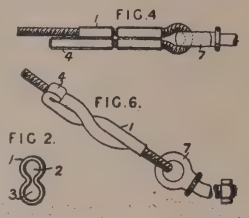
For boring, drilling, and recessing the bosses of propellers, etc.; half lapping and mitreing the laminations; recessing and drilling the spars, etc.

TYPE PF.



Write for further particulars.

cabin. A drum 62 on the same pillar operates through cords 63, 65, the plane 25 and the rudder 49 simultaneously.



108,605. Wire Strainers. DYE, L., 188, Hearsall Lane, and SEED, E. A. D., 2, Market Street, both in Coventry. Nov. 8th, 1916, No. 15993. [Class 45.]

A locking-device for wire strainers of the turnbuckle type comprises a finger D hinged to the wire cable and slotted at I to receive a locking-pin H which passes through the part D and the screwed sleeve A. A second trough-shaped locking-member J secured to the other wire and slotted at K may be provided together with a square sleeve G which embraces both locking-members and through which the pin H passes.

108,608. Rope-fasteners. MCCABE, I. E., Lexington, Nebraska, U.S.A. Nov. 9th, 1916, No. 16081. [Class 109.]

Relates to means for securing the end of a cable to an eye-bolt or the like, and more particularly for securing the end of a wire cable used as a guy or brace to the frame-work of an aeroplane. The cable end part is passed through a passageway 2, Fig. 2, in a pliable metal sleeve fastener 1 of 8-section. It is then passed through the eyebolt 7^1, Fig. 4, and returned through the other passageway 3 in the fastener. The passageway 3 is formed longer than the other, to allow of the end portion 4 being turned back upon itself. The fastener is then twisted as shown in Fig. 6.

WEAVERS' WAGES.

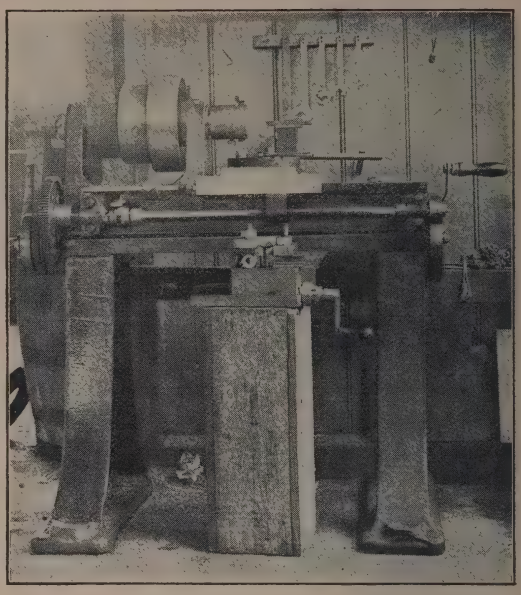
The award of Mr. Vesey Knox, who held an arbitration on the application of tenters employed in Belfast weaving factories for an increase of wages, was issued on October 10th. It concedes an advance of 9s. per week to men employed on or in connection with munition work.

A SMALL SINGLE-PURPOSE LATHE FOR AEROPLANE STRAINERS.

The photograph herewith illustrates a small single-purpose lathe, designed and manufactured specially for Aeroplane Strainers by the East Anglian Engineering Co., Ltd., Stowmarket.

Some few weeks ago it was found necessary to purchase a small lathe for producing these parts on a large scale, with unskilled girl labour. As it was impossible to obtain anything like reasonable delivery, it was decided to manufacture a number of these small lathes, and Mr. Burch, works manager, designed the above simple lathe.

The object kept in view was Rigidity, Simplicity and Cheapness. A pattern was found for the legs, and, although rather heavy, it was used without alteration. The bed was made of a double Vee slide, broad faced, with the headstock cast in one piece. A mild steel spindle of large diameter, fitting into gun-metal taper-bushes, and a three-step cone, with broad faces, made a very powerful drive.



The saddle is of simple design, with a single screw having micrometer adjustment, but is so arranged that it can be fixed in any position by a bolt in a Tee slot, thus allowing for taper-turning, the feed in this case being by hand.

The lead screw is an ordinary Vee thread, and is operated by a three-step feed-cone from the main spindle, and driving through a friction clutch.

An adjustable stop is arranged on the front of the bed with a fine adjustment on the saddle. The saddle can be traversed up to the stop, the friction clutch in the feed-cone giving the necessary slip required. A convenient handle at the left operates the feed-screw, and a handle on the right gives a rapid hand-control over the same.

All the handles are easily reached by the operator whilst seated at the machine; this is an important matter, as a female worker can easily work eight to ten hours without being fatigued.

The lathe, as illustrated, is shown with the slide removed, and a simple rounding attachment is fixed. The slide is shown in front of the lathe, and is set up with double tools for reducing the small pieces. The chuck was some considerable trouble, as

The East Anglian Co.'s Single-purpose Lathe.

it was impossible to fit up spring collets, etc. Finally this was made of C.I., with small hardened steel bushes.

With this lathe we found it possible for an untrained female to operate it in a few hours and to produce these small pieces accurately within 0.001 in. The method adopted is to divide each steel and bronze piece into a number of simple operations, each of which takes about one to two minutes.

WHITECRAFT.

The present war has offered many opportunities for those who, in the language of an American contemporary, are heavy depositors in the Bank of Nerve and Imagination, to become famous in a very short time, and if Mr. J. A. Whitehead, Governing Director of the Whitehead Aircraft Co., Ltd., of Richmond, is covetous of fame—which one is assured he is not—he cannot but be enjoying his full meed, for his name is abroad the width and the breadth of the land as the inventor of Mother's Day.

Only yesterday, unless an unkind fate intervened, with the assistance of the Lord Mayor of London, he diverted the historic Cardinal Wolsey River from its natural bed which flows through the Whitehead estate at Hanworth Park, a feat which entitles him to go down to history along with Moses and Canute as a Professor of Hydrostatics.

Yet another example of almost startling publicity is found in that very old and respectable weekly "The Car," which has devoted a special issue to advertising Mr. J. A. Whitehead and all his works. Most of the leading article is composed of an appreciation of Mr. J. A. Whitehead, and four profusely illustrated articles on various aspects of Mr. Whitehead's activities also appear. "The Car" has seized the opportunity with so such enthusiasm that ten pages of its fifteen pages of text are devoted to this absorbing subject.

One feels sure that this overwhelming tribute to Mr. Whitehead's enterprise is entirely spontaneous, and there seem to be indications in the special articles that they were not inspired by the subject of their eulogies.

For instance, the article by Mr. George Neill says:—"It is wholly owing to the energy and ability of such men as Mr. Whitehead that the science of aviation has been advanced so rapidly." . . . "To keep our memories green and to impress upon the public the celerity of development accomplished, here are a few salient facts in relation to the industry." The writer goes on to record various outstanding dates in the aircraft industry starting from 1900 and extending to 1912.

One is perfectly sure that Mr. J. A. Whitehead would be the first to disclaim the title of pioneer, as such. In fact, it is rather a matter of pride to him that the Whitehead works only commenced operations in 1915. Nevertheless, he is certainly a pioneer in the particular form of meteoric performance for which he has become so well-known in the Aircraft Industry.

One looks forward with interest to the next manifestation of Mr. Whitehead's unique ability.

AIRCRAFT FINANCE

CURRENT TOPICS.

The Conversion of Private into Public Companies.

The benefit to be derived by working a business as a private company under the Limited Liability Acts was fully set out in these columns in the previous issue, and, judging by the amount of correspondence I have received, appears to have interested a very large number of my readers. One correspondent, adopting the nom-de-plume of "Factor," raises a point of more than general interest. He writes inquiring whether a private company can be converted into a public company, and, if so, what are the necessary formalities.

The Companies (Consolidation) Act, 1908, specially provides the necessary machinery for carrying this into effect. Section 121, sub-section 2, provides:—

> "A private company may, subject to anything contained in the memorandum or articles, by passing a special resolution and by filing with the registrar of companies such a statement in lieu of prospectus as the company, if a public company, would have had to file before allotting any of its shares or debentures, together with such a statutory declaration as the company, if a public company, would have had to file before commencing business, turn itself into a public company."

So soon as the formalities have been carried out, the company would then be in a position to allot shares to any number of subscribers—i.e., the number of its members, hitherto limited to 50 as a private company, becomes unlimited, and, subject to complying with the Treasury order with regard to public issues, may issue invitations to the public to subscribe for its capital or debentures. The increase of the capital of the company would be carried out simultaneously, and this would entail the payment of the additional fees on the increased capitalisation to the Registrar of Joint Stock Companies.

The statutory fees for a company with a nominal capital of £50,000 are as follows:—Duty on capital, £125; fee stamp on memorandum of association, £16 5s.; deed stamp on memorandum, 10s.; deed stamp on articles, 10s.; fee stamp on articles, 5s.; fee stamp on notice of office, 5s.; total duty and fees, £142 15s.

The Meaning of "Treasury Consent."

Treasury consent is apparently not essential if capital to be raised is to be obtained privately. This point appears to be imperfectly understood. The Treasury have no legal machinery to control or prevent any issue of shares.

Recipients of prospectuses should bear this in mind, as many are under the impression that because a prospectus is issued it must necessarily have received Treasury consent.

The only course the Treasury may adopt where issues are made without "Treasury consent" is to publish a notice in the Press that the Treasury consider such an issue to be contrary to public or national interest. This was the course adopted quite recently in connection with a share issue made by advertisement in the Press.

It is different in the case of debentures, as the debenture bond, before becoming "legal tender," requires stamping, and Somerset House officials refuse to accept the bond for stamping unless accompanied with the written Treasury sanction. Consequently the Companies department, acting in harmony with the Treasury, are thus able to enforce compliance in so far as it affects debenture issues, but is powerless, for want of legal means, to prevent issues of shares. Be it noted that the Treasury view favourably any issue if it can be shown to be of "national interest," consequently the aeroplane industry, being essentially of national utility, should support the Treasury views in every way in its power.

[For which reason any issue of shares in aircraft firms which are made without it being clearly stated that they are issued with Treasury consent should be viewed with suspicion.—Ed.]

Balance-Sheets and the Companies Acts.

The Companies (Consolidation) Act, 1908 (section 113, sub-section 2), stipulates that "The auditors shall make a report to the shareholders on the accounts . . . and the report shall state (a) whether or not they have obtained all the information and explanations they have required, and (b) whether, in their opinion, the balance-sheet referred to is properly drawn up, so as to exhibit a true and correct view of the state of the company's affairs, according to the best of their information and the explanations given to them, as shown by the books of the company."

Section 3 stipulates that "the balance-sheet shall be signed by the directors." Section 4 provides "that if a copy of the balance-sheet has not been signed as required by the Act, be issued, circulated, or published, the company, every director, manager, secretary, or other officer of the company knowingly and party to the default, shall be liable to a fine not exceeding fifty pounds."

From this it will be seen that the Act is very definite and very clear, and would appear to cover all the necessary requirements for the protection of the shareholder. Unfortunately in actual practice, notwithstanding what would appear to be the protective clauses in the Act, the customary balance-sheet issued to-day is anything but a clearly defined statement of affairs understandable by men of ordinary business intelligence.

What Is a Balance-Sheet?

A balance-sheet is generally defined to be a statement of liabilities and assets, but even this is incomplete, as in many cases items are included as liabilities which are not, strictly speaking, liabilities, such as reserve fund and balance of profit and loss, whilst on the asset side items may appear as accumulated loss, to the debit of the profit and loss account, and expenditure carried forward not represented by any available assets. When to these factors are added looseness of statement, want of method, lack of reasoning, and total absence of

logical precision, one is bound to arrive at the conclusion that accountancy is by no means the exact science which it represents.

The gravest charge which can be brought against the balance-sheet of many aeroplane and kindred concerns is the manner in which wasting assets are dealt with. When one sees grouped under one head such items as freehold and leasehold properties, fixtures, machinery, plans, designs, and fittings, all included as one item in one lump sum, it is perfectly clear that no logical method of depreciation can possibly be arrived at.

No method of book-keeping or accountancy can do away with the fact that the value of a ten years' lease should be redeemed in ten years, and that ten per cent. of the sum for which this lease figures in the books of the company should be redeemed each year. But this item is carefully hidden by grouping together in a mass partly fixed assets, partly wasting assets, and partly assets originally legitimate, but now of no value.

It is therefore clear that it becomes impossible (1) for the accountant to deal with the redemption of wasting assets in a logical, sound, and proper manner, and (2) equally impossible for any shareholder, however intelligent, to ascertain the true position of the company. Notwithstanding the careful manner in which the Act has been framed to give to the shareholders the greatest possible protection, it provides no legislation to deal with these important points.

Foreign Trade Regulations.

The Controller of the Foreign Trade Department has issued a new consolidating list, which should be in the hands of all aircraft firms trading abroad, containing the names of over two thousand persons and firms with whom persons in the United Kingdom are forbidden to trade under the "Trading with the Enemy Proclamation."

The Department states that although the statutory list has now been in existence for a year cases still come to the notice of the Controller in which firms are corresponding with persons on the statutory list, and they not infrequently give as an excuse that they have never heard of the list. It is important that everyone engaged in foreign trade should realise that he is under an obligation to make himself familiar with the statutory list, and to observe it in his dealings.

Failure in this respect renders him liable to the heavy penalties provided by the Trading with the Enemy Acts, and these apply to holding any communication whatever with anybody on the statutory list, and not merely to entering into an agreement or continuing to carry on business with such persons. In exceptional cases, where it appears to be necessary, and where it is not contrary to the public interest, a licence may be obtained from the Foreign Trade Department exempting from the prohibition.

Copies of the consolidating list and of all additional lists may be obtained at a small cost from the Superintendent of Publications, His Majesty's Stationery Office, Imperial House, Kingsway, W.C.—G. A.

ANSWERS TO CORRESPONDENTS.

A Financial Specialist will be pleased to answer in these columns inquiries on any subject affecting or relating to Investments, Stocks, Shares and Securities of Aircraft and kindred companies, free of charge.

"Equality."—Many thanks for the cutting which you send me. There is no doubt that something in the direction of compelling directors and officials to make disclosure of their dealings in the shares of the company which they are presumed to control should be published for the benefit of shareholders, but I much fear that a law to carry this into effect could so readily be evaded as to become practically inoperative. It would be such an easy matter for anyone not wishing to appear in the transactions to have the shares put in the name of relatives or nominees. Still, it is a point that merits deep consideration, and I am obliged to you for bringing the paragraph in question to my notice.

"Rigid."—A company may not purchase its own shares, notwithstanding any special power provided in its articles of association. However much it may be to the advantage of the company so to do, it is illegal, as by doing so it would have the effect of reducing the share capital of the company.

"Justice."—The shares being only partly paid the liquidator has a legal right to call upon you to pay up the balance remaining uncalled on the shares, and may proceed to enforce payment by legal proceedings if you fail to comply.

"Comparison."—You have omitted to take into consideration the sign affixed to the official quotation which denotes that the transaction in question was in respect of "a small amount," seller paying stamp and fee. The single asterisk against a price recorded in the official list means that "the bargain was effected with or between non-members."

COMPANY NOTES.

Fellows Magneto Co., Ltd.

This Company, in making the declaration of the payment of the first half-yearly dividend at the rate of 8 per cent. per annum, issue a special letter to the shareholders, of which the following extracts are the principal points. Since the Company commenced trading, the original size of the factory has been nearly trebled, and the output during the three months (May, June and July), for which the accounts are completed, shows a steady increase of the business, and the directors expect that by the end of the year the output will exceed £14,000 per month.

A very interesting point is the announcement that Treasury Consent has been granted for an issue of a further £40,000 in Preference shares. One awaits full information, which one will take the earliest opportunity of placing before our readers.—G. A.

New Company Registration.

Wycombe Aircraft Constructors (Ltd.). Registered October 5th, 1917. Capital, £50,000 in £1 shares.

Company in Liquidation.

General Aviation Contractors (Ltd.), 25 to 28, Crosby Buildings, Crosby Square, creditors and contributories. First meeting, October 24th, at Carey Street, Lincoln's Inn, London.

The Birmingham Small Arms Co., Ltd.

The annual ordinary general meeting of the Birmingham Small Arms Co., Ltd., was held at the Grand Hotel, Birmingham, on Oct. 12th. Sir Hallewell Rogers, chairman, presided.

The supplementary report of the directors and the balance-sheet as at July 31st, 1916, having been adopted, the chairman proposed the adoption of the report for 1917, which recommended a dividend of 5 per cent. and a bonus of 2s. per share on the Ordinary shares, leaving, after £150,000 had been transferred to general reserve (making it £400,000), a balance of £170,306 3s. 11d. to be carried forward.

The chairman said:—The record of your company during the past year has been one of steady increase in the supply of several important munitions of war, and of untiring effort of all concerned in the company, managers and workers alike, to

meet the ever-growing demands of the Ministry of Munitions in various supplies. The departments have been devoted almost entirely to Government work. The deliveries of Service rifles have been in excess of our promises to the Government, and have now reached a steady output which, before the war, was hardly dreamt of. Our efforts have contributed materially to relieve any anxiety in this direction.

A still more important development at our works has been in the manufacture of the Lewis automatic machine-gun, which has been, and is being, turned out in numbers greater even than the Ministry of Munitions at one time thought possible. I think it would not be out of place for me to say here that the country is indebted for this weapon, which has had so great an effect in the fighting, first to the ingenuity and patent work of the inventor, Colonel I. N. Lewis, late of the U.S. Coast Artillery; secondly, to a group of Belgian gentlemen, headed by Mr. Joseph Waterkeyn, who, a year or more before the war, saw the possibilities of the gun, and formed a company to purchase the European patent rights; and lastly, to this company which, in 1913, recognising the merits of Colonel Lewis's invention, entered into an agreement with the Belgian Company whereby the European manufacturing rights were secured, and at once commenced on the manufacture of models.

Orders were placed by the British War Office on the outbreak of war, first in small quantities, but increasing ever since. I do not hesitate to say that when the history of this war comes to be written in detail the Lewis machine-gun will have very prominent mention as one of the outstanding advances in weapons of war which contributed so much to the success of our troops. Our cycle department, although occupied to some extent in the supply of military bicycles and motor-bicycles to the English and Allied Governments which have been required on all fronts, has been largely devoted to the manufacture of parts of aeroplane engines and aeroplanes.

The Daimler Company.

At Coventry, the Daimler Company's works also have been given over entirely to the supply of Government requirements; in the early stages of the war the manufacture of vehicles for the Mechanical Transport for a time took the whole output. Heavy projectiles have been delivered in large quantities. In December last, at the urgent request of Dr. Addison, the then Minister of Munitions, your directors willingly loaned to the Ministry the services of our able managing director, Mr. Percy Martin, as Controller of Internal Combustion Engines, and also as a member of the Air Board representing the Ministry of Munitions.

Future Development of Trade.

After referring to the balance-sheet, the chairman concluded: All industrial concerns are naturally interested at the present time in the future development of trade after the war. Your directors place this in the forefront of their future policy, and believe that our welfare will depend entirely upon the co-operation of capital and labour. From this point of view they are interested in the National Alliance of Employers and Employed, the outcome of which they believe will result in the production of a programme adopted by both employers and employed which should put their mutual relations on a satisfactory footing. We feel convinced that the real workers in this country will not be led away from the essential issues of the future, a due recognition of which is necessary to the welfare of the workers themselves, and that they will not be misled by the few, though noisy, agitators who are advocating an extreme policy which, if adopted, would lead to the destruction of the commerce and industry of the country. Your directors believe in the soundness of the British workman and public, and, therefore, have no fear of that happening, which is happening in enemy countries, according to the news of the last few days. All classes having fought side by side in this great war, it is not too much to expect that they will continue to fight side by side in the cause of industry.

Mr. E. Manville seconded the motion, and explained the working of the National Alliance of Employers and Employed, remarking that the representatives of Labour associated with it were fair and broad-minded men, and if they could only carry their rank and file with them in the proposals that were being discussed, there need be no misgivings as to the future of the industry of the country.

The resolution was carried.

It was decided to double the directors' fees for 1916-17, and it was stated that Mr. Neville Chamberlain, who left the board to take up Government work, would shortly rejoin.

THE SOPWITH CO.'s SPORTS.

As a result of the success of the works sports recently held by the Sopwith Aviation Co. at Kingston, a sum of £120 18s. 9d. is available for the Flying Services' Fund, instituted by the Royal Aero Club. Owing to the generosity of the directors of the Sopwith Aviation Co., this amount has been increased to the round sum of £125. One understands that a cheque for this amount has been handed to the secretary of the Royal Aero Club.

THE TURIN-LONDON FLIGHT.

It is interesting to note that Dixie magnetos were fitted to the Fiat engine of the S.I.A. aeroplane used in the recent non-stop flight from Turin to London.

CAUDRON RECREATION.

On Saturday, October 13th, a sports ground, provided by the British Caudron Co., Ltd., for the use of their employees, was formally opened by Sir William Ramsay. The ground is situated off Preston Road, Wembley.

To celebrate the event the firm's football team played a match against the Aircraft Manufacturing Co.'s Second Division of London Munitions League team.

(*Continued from page 1100.*)

Capt. R. G. H. Pixley, M.C., attd. R.F.C., who was reported missing on June 4th. News will be gratefully received by Maj. Pixley, Maybury Knowle, Woking.

* * *

If any officer or man can give any information, or if relatives of prisoners of war in Germany would ask for news of Lt. A. J. C. E. Phillippo, pilot, R.F.C., who was reported missing on June 7th, the same would be gratefully received by Mrs. Phillippo, 6, Woodville Road, Bexhill-on-Sea.

* * *

During a flight by a number of British aeroplanes over London on Oct. 8th, one of the machines developed engine trouble, and the pilot, after gliding several thousand feet, made a forced descent on Parliament Hill Fields. The machine was badly damaged, but the pilot, Lieut. Gordon McNeil, escaped with cuts and bruises.

[Incidentally, the spectacle of British aeroplanes over London created something of a sensation in certain over-populated districts of the town.—Ed.]

FRANCE.

Official Communiqués.

Oct. 9th.—Our air service, in spite of the wind, which was blowing a gale, co-operated actively in the attack, turning their machine-guns from a low altitude on the enemy infantry, and keeping touch with other arms.

Oct. 11th.—Lieut. Boyau brought down his 10th enemy machine on October 1st.

Oct. 15th.—In the region of the plateaux between Ailles and Craonne the artillery activity was violent during the day. There were patrol encounters in Champagne West of Auberive. There was an intermittent cannonade on the rest of the front. Two German captive balloons were brought down to-day, one by the fire of our special guns, the other by one of our aviators.—Reuter.

Oct. 15th.—German aviators bombarded the Dunkirk region last night. There were several victims among the civil population.

Two German captive balloons were brought down to-day, one by the fire of our special guns, the other by one of our aviators.

* * *

A report from Paris on Oct. 15th gives some details of the aerial engagements in which the death of Capt. Guynemer was avenged by one of his comrades, Lt. Fonck, have been made known. On Sept. 30th Fonck was flying at a height of 7,000 ft. when he was attacked by a German two-seater piloted by Wissemann, the German who shot down Guynemer. Fonck escaped the first rush by clever manœuvring, got behind the German machine, and opened fire from below. Wissemann was shot through the head, fell out of the aeroplane, and dropped to the ground. The observer was also killed. Fonck is officially credited with 15 victims, five of which were shot down in six days.

GERMANY.

Official Communiqué

Oct. 11th.—The losses sustained by the enemy aerial forces in September on the German fronts amount to 22 captive balloons and 274 aeroplanes, of which 167 were behind our lines. The remainder were seen to have been brought down beyond the enemy positions.

In encounters we lost 82 aeroplanes and five captive balloons.

In an aerial battle which developed in the evening over Zonnebeke-Zandvoorde, in which about 80 aeroplanes participated, three enemy aviators were shot down.

RUSSIA.

Official Communiqués.

Oct. 10th, Baltic Sea.—Also on October 8th, 14 enemy aeroplanes approached Tserel (southern end of the island of Oesel); some of them fired bombs on our transports at Ajtchod.

On October 9th, at 7 a.m., eight enemy aeroplanes attacked without result the batteries of Tserel and the village of Mento, six miles north-east of Tserel.

On October 8th our machines dropped 20 bombs on the Rodenpois Station (on the Riga-Petrograd railway) and on one of the Riga stations.

The aviator, Captain Brusilovitch, brought down an enemy aeroplane in the Hintzenberg sector, in the Riga region.

In the Buczacz region (Galicia) the French aviators Lakman and Codourier brought down an enemy machine in flames.

Oct. 13th.—In the region of the Gulf of Riga the enemy has made several air raids.

On October 10th nine enemy aircraft dropped 23 bombs in the region of Tserel (southern end of Oesel Island) and on our transports. One of the transport steamers was slightly damaged. Our avitaors, by a daring attack, dispersed the enemy machines and drove two of them into the sea.

Oct. 14th.—During the numerous aerial reconnaissances and engagements in the region of Oesel Island our aviator Galaktionoff brought down an enemy aeroplane, which fell to the ground.

Oct. 15th.—On the Northern front our aviator Captain Kossovsky brought down an enemy single-seater, which fell to earth south-west of the Kronberg Manor.

ITALY.

Official Communiqué.

Oct. 14th.—Yesterday, about 4.30 p.m., our seaplanes successfully bombarded several enemy destroyers sailing near the Istrian coast. A violent explosion was observed on board one of them.

* * *

Without, of course, being rash enough to prophesy as to the first crossing of the Atlantic, via the aerial way, one can perhaps venture to point out some pros and cons bearing on the report from America, which naturally is hopefully echoed in the Italian Press. Apart from the share of Chris. T. Columbus in that country's past, Italy has considerable interest in the U.S., and would hail the prospect of being the first nation to bring it nearer to her own part of the world.

One, however, scarcely sees the suitability of any of the present types of "CA's" for the purpose, though possibly an amphibian with the same weight-carrying propensities might be, or may have been, evolved to fill the bill. Something faster seems desirable unless trust in the prevailing wind is being relied on. While on the subject it is well to remind oneself that war has not increased the radius of action of aeroplanes, on the contrary, and very distinctly so.

With the immense increase of horse-power has come corresponding increase in fuel tanks. It is probable that to equal the pre-war duration flights with a modern 'bus something of a tank-ship body would have to be designed. Better results might be obtained if some attempt were made—at any rate, on the later fast Italian machines—to pay some slight regard to streamline in the designing of the nacelles and (fixed) motor cowls.

Examination of any of the few illustrations going round would horrify a designer of 1914. If there is anything in streamlining, can it be ignored in war-time? If the engine must be put in a square box bristling with excrescences, might not the whole affair be enclosed in a light non-metal cowl, which might incidentally be a protection to the engine, or be, say, of some bullet-proof material. As it is, machines are getting to look horrible. A point in the "reprisal" scheme?

* * *

Details of the great surprise raid undertaken a few days ago by an Italian air squadron upon the Austrian naval base at Cattaro have been received from the Italian Headquarters. The objective of the raid, which took place on the night of the 4th inst., is—like Pola—one of the largest Austrian naval bases. The central portion of the harbour with regard to the long stretches of Adriatic coast is specially adapted, now that the largest Austrian ships are behind their protecting nets, as a refuge and harbour for the enemy submarines and destroyers which operate in the lower Adriatic.

The chief objectives of the Italian air squadron were spread between Port Rose, an important submarine base with factories and supply depots, and the coast zone to the east of Castelnuovo del Canale and of Kumbar, which is crossed by the only railway in the Cattaro region. This is filled with supply depots, magazines, arsenals, and barracks.

The Italian squadron set out on a clear night, but when over the sea ran into a dense fog, which prevented the pilots taking advantage of the signals which they were to receive from Italian destroyers. The Italian pilots, however, so successfully navigated their machines that all arrived over Cattaro absolutely unsuspected by the enemy. Bombs were dropped on the submarine, destroyer, and seaplane stations, while depots and sheds were also hit with good results. At Kumbar a petrol depot was set on fire, while the sheds round the port of Gjenovitch were also set alight. A desultory and ineffective fire was made by the enemy, but none of the Italian machines was damaged, and all returned safely to their bases after a flight of four hundred kilometres over the sea and in a dense fog.

* * *

Signor D'Annunzio, the Italian poet, has received his fourth medal for bravery, in recognition of his services during the air raid on Cattaro.

* * *

An extraordinarily long "Stefani," dealing with the "CA" raid on Cattaro of the 4th inst., points out that the great expanse of water in the Bay rendered the work of destruction doubly difficult, as every one of the objectives of the raid was at a distance from all the others. Happily, the enemy seems to have been sleeping the sleep of the over-confident, and to have been unable to shake its effects off in time to do the bombers any harm.

* * *

Dealing with other aerial operations, "Stefani" says: Mention, too, must be made of the other minor but brilliant victories obtained by our pilots in the daily engagements at the Front. From Sept. 24th, 1917, to Oct. 3rd, six enemy 'planes were brought down, and two were obliged to land. On Sept. 24th, Serjt. Pennella brought down a "hunter" near Zagorje. On

D. ANDERSON & SON, Ltd., Lagan Felt Works, Belfast; and Roach Road Works, Old Ford, London, E.

the 26th, over the Sette Comuni Plateau, an explorer and the "hunter" escorting him were attacked by our planes. The former fell in flames at Asiago to Serjt. Imolesi, the latter was obliged to land towards Cima Dodici owing to the efforts of the same, Imolesi and Lt. Mazzini. On the 26th, too, the Serjts. Aliperta and Ferranti brought down an enemy near St. Lucia Tolmino. On the 29th, an explorer, shot down by Lts. Sabelli—[Our old friend Giovanni, of Brooklands.—Ed.]—and Parvis, fell behind our lines near the Pietra Rossa Lake.

Three consecutive successes were obtained by Major Piccio during the same period. On Sept. 26th he brought an enemy smashing down on the Ternova Plateau. On the 2nd he brought down another, in flames, among our lines near Auzza, and on the 3rd he obliged the third to land in our lines Mesmial way.

So Major Piccio scores 15 victories, Lt. Sabelli scores 5 victories, and Serjt. Imolesi scores 3 victories.—T. S. Harvey.

RUMANIA.

Official Communiqué

Oct. 12th.—Four enemy aviators bombed the city of Galatz, and, descending to a very low altitude, fired with their machine-guns, causing a number of victims among the population.

GREECE.

Lieut.-Commander Aristide Moraïtinis, Royal Greek Navy, attd. R.N.A.S., Eastern Mediterranean, and brother to Mrs. Cecil Pilcher, has been awarded the D.S.O.

* * *

Athens, Oct. 14th. Delayed.—General Haralambis, the Chief of the General Staff, confirmed before the Parliamentary Commission of Enquiry the report that a German aeroplane had landed at Larissa in January, 1917, bringing Colonel von Falkenhausen, who came to confer with General Haralambis on the military situation in Greece. Colonel von Falkenhausen communicated by telephone with the Royal Palace and afterwards left again by aeroplane. Although the affair had already become known and had been reported in the newspapers, the statement has made a strong impression.—Reuter.

U.S.A.

Mr. Godfrey L. Cabot, President of the Aero Club of New England, and a Vice-President of the Aero Club of America, has put $30,000 at the disposal of Rear-Admiral Bradley A. Fiske, U.S.N., retired, the inventor of the torpedoplane, for the development of a craft capable of carrying and launching a full-sized torpedo, the weight of which is 2,000 lbs.

In announcing his gift Mr. Cabot said he was convinced the torpedoplane offered the only apparent means of destroying the German fleet, which, in Kiel and Wilhelmshaven, is protected from attack by other war vessels, rows of mines and shore batteries. Mr. Cabot intimated also that if $30,000 were not enough for the purpose he would enlarge his contribution.

AUSTRALIA.

It is reported that three Federal aeroplanes have performed a flight over Melbourne, dropping leaflets advertising the Liberty War Loan.

THE DEATH OF STANLEY COWNIE.

It is with great regret that one records the death of Mr. Stanley Cownie, who was accidentally killed while flying on Oct. 13th. Mr. Cownie was the chief instructor at the Beatty school, and had been remarkably successful in turning out first-class pilots for the R.F.C.

One gathers that Mr. Cownie was flying a small tractor biplane, and put the machine into a voluntary spin at an extremely low altitude. Unfortunately, there was not sufficient room for him to pull the machine out, and it struck the ground almost vertically, killing the pilot instantly.

Stanley Cownie, who was born on June 2nd, 1897, in London, took his certificate, No. 3324, on Aug. 8th, 1916, at the Hall School, on a Hall biplane. He was immensely popular with all who came in touch with him, and was a very able instructor. As a rule, he was a careful and steady pilot, though as clever in handling a machine as any. On can only imagine that in the exuberance of a moment he took a risk which normally he would not have taken, and that his luck was against him.

At the inquest held on Oct. 15th, evidence was given that at a height of about 500 ft. he commenced to spin, failing to realise that he was at such a low altitude. The machine crashed to the ground, the pilot's skull being fractured.

Mr. G. W. Beatty said the deceased was an experienced pilot instructor, but this was the first time he had attempted to spin. Witness had advised him that before doing so his machine should be at a considerable height, so as to allow for a nose-dive afterwards. He thought there was an error of judgment.

The jury returned a verdict of "Accidental death."

All will sympathise deeply with his relatives, and also with Mr. George W. Beatty, who had the greatest regard for Mr. Cownie, and considered him as quite one of the pilots of the future, as well as being an excellent instructor, despite his youth. The accident is naturally a great blow to all concerned with the Beatty School, which has hitherto enjoyed remarkable immunity from serious accidents of any kind, although a very large number of pilots have been produced.

SIGNOR CAPRONI'S VIEWS.

A Reuter telegram from Paris says:—

The "Petit Parisien" of Oct. 10th prints an interview with Signor Caproni, the inventor of the famous aeroplane bearing his name. Signor Caproni states that the present war is essentially a war of *matériel*, and it is highly necessary that the enemy production should be curtailed. This can be done. Thanks to the great strides made in aviation it is easy to imagine a powerful attacking force of three hundred large biplanes, each one capable of dropping one to two thousand kilogrammes of explosives on Essen, Pola, or Vienna.

On the subject of submarines, Signor Caproni said that the methods used by the Allies were not quite up to the task they had to perform. A man does not destroy a swarm of wasps by attacking them separately, but by smoking out the wasps' nest. In the same way, in order to get rid of the submarines, we must destroy their bases. Squadrons of aeroplanes paying regular visits to these bases would soon bring about a marked reduction in the submarine fleet. So, too, if by continued bombardments they compelled the enemy's aviation centres to withdraw farther from the front, they would secure greater freedom from attack on our own front.

Signor Caproni is of opinion that too much importance is attached to duels in the air, while too little stress is laid on raids against enemy bases. The Allies, he added, ought to have in the near future a fleet of two to three hundred big bombing aeroplanes, capable of carrying two thousand kilogrammes of explosives apiece, to be used for the destruction of enemy factories, bridges, naval bases, etcetera.

[With which sentiments Mr. Handley Page and other advocates of big aeroplanes will agree. But why 200 instead of 2,000?—Ed.]

EAST ISLINGTON.

Both the friends and enemies of Mr. Pemberton-Billing will learn with interest that it is the intention of the Society of Vigilantes, of which he is the founder and moving spirit, to put up a Vigilante candidate for the seat for East Islington, rendered vacant by the death of Mr. Radford.

Whatever may be Mr. Billing's faults, and he has as many as most human beings, lack of loyalty to the British Empire and lack of earnestness for the causes which he has championed are not among them, so an interesting three-cornered fight may be expected, seeing that the Coalition and the new National Party are both putting up candidates, and consequently all three competing parties will stand for Imperialism. Two at least—the Vigilantes and the Nationalists—will stand for Purity in Politics, and probably two—the Vigilantes and the Coalitionists—will stand for an Imperial Air Service, seeing that the Government has now accepted the I.A.S. in theory.

The name of the Vigilante candidate is not announced at the moment of writing, but, judging by the accounts published in the "Imperialist," the official organ of the Vigilantes, there is not likely to be much difficulty in finding a candidate, nor any lack of funds to fight the election.

There is no doubt that as the leader of the Vigilante movement Mr. Billing has now an excellent opportunity of emphasising the soundness of the changes which he has advocated in the past two years, even though the manner of his advocacy may have displeased some of his erstwhile supporters. The recent raids on London make the matter of aerial defence of as great importance in this election as at the time of Mile End and East Herts, only the circumstances are very different. In those days Mr. Billing was a voice crying in the wilderness, to-day he has everyone, even the political opponents of the Vigilante candidate, in entire agreement with him. So great has been the change that we even find Mr. Billing and General Henderson both working in their respective ways for a great Imperial Air Service.

There is no fault to be found with the intentions of those now responsible for the production and use of our aircraft, and such troubles as may seem to provide grounds for complaint are legacies from a previous régime, which troubles could not possibly be put right in weeks or even months. It is, therefore, to be hoped that in his support of the Vigilante candidate Mr. Billing will confine his criticisms on aerial matters rather to what might have been done in the past than to anything which may be in process of being done at present. An announced intention to support the Government in its present intention of well-doing in things aerial will certainly win the Vigilante candidate more votes than will wholesale condemnation of everything Governmental, simply because it happens to pertain to the Government.

A very much bigger air fleet is needed, and we are in a fair way to get it. East Islington will doubtless vote for a big air fleet, and every vote recorded on such grounds will confirm the justice of the agitations of the past. It remains to be seen, therefore, whether the free and independent voter will vote for what the Coalition candidate promises in this direction, or for what the Nationalist candidate promises that he will press the Government to do, or for what the Vigilante candidate promises that he will jolly well see the Government does, or know the reason why.

At any rate, the Vigilante candidate will have one great advantage, in that having had no political past he will have nothing to recant, and so will be less easy to heckle than the others.

AERIAL ALLOTMENTS.

[The following article has nothing to do with the food question, beyond the fact that it may indicate how some people earn the money that buys their food, and how the nation's money is spent. Whoever wrote it presumably knows what he is writing about, but the Editor takes no responsibility in case any of the matters mentioned may bear some resemblance to facts. The Editor cannot guarantee, however, that the whole article is one elaborate lie.]

Aeronautical Transitorial Directorate,
Allocatory Department,
Military Antics Office,
Blighty, N.W.

Any further communication on the subject should be addressed to the Director-General of Allotments, and the following reference quoted, 300259/Perplexity/Q.E.D.

Gentlemen,—With reference to the allocation and dispatch of machines from your works, I am to inform you that all existing instructions are hereby cancelled, and the instructions contained herein are to be followed in the future.

It should be noted that this cancellation does not affect any outstanding allocatory instructions affecting machines that have already been dispatched, and according to usual departmental procedure, it is not likely to affect their dispatch in the future either.

Applications for allocation of machines (a) with engines, (b) without engines, should be made to the examiner I/C stationed at your works at least one calendar month before the machine is ready for dispatch, in order that the necessary departmental procedure may be followed out through the necessary official channels.

In order that there may be as little delay as possible, this department has been placed under the direction of an experienced Allocatory Director Assistant Deputy General, viz., Professor Minus Halfit, the well known geologist and eminent golfer, whose handicap now stands at + 1, who has, with the approval of this department, added the following technical terms to the A.G.S. lists, to prevent any ambiguity on the subject.

ALLOCATE—To place, to distribute, to give everyone his share after the job is finished.

ALLOCATION—Act of assigning or alloting something you don't require.

ALLOTTEE—One to whom a share is alloted of material someone else is waiting for.

ALLOTMENT—A portion of the earth's surface, the upper stratum of which consists of old boots, empty tins, builders' refuse, and a little soil, which, if not exactly an ideal compost for growing exhibition crops of vegetables, makes an excellent necropolis for dud aeroplane fittings.

ALLOCATORISMS.

All machines without engines for which Allotmentary Instructions have not been received are to be delivered Somewhere, the official whereabouts of which will be forwarded to the A.I.D. headquarters.

Any machines which may have had engines fitted previous to receipt of this notification, must have them taken out again, in conformity with the foregoing paragraph.

In order to prevent congestion and confusion at your works, which might possibly occur through insufficient engines being available for fitting into machines for which engines are not to hand (see also previous paragraphs), and which may not otherwise have been assigned allotment, may, if there are no vacant skating rinks, Zoos, or other suitable buildings allotted for this purpose in your vicinity, be dispatched into store, the procedure set out in Paragraph I being followed to obtain the necessary allotmentary information.

Upon notification that a machine has been allotted into store, the contractor should communicate with the Officer Commanding Central Aircraft Fitting Department, Room 927 (Telephone Hopping 7634XO1), and obtain from the Director-General of Removals, the necessary forms for daily movements of packing cases, which must be filled in according to the instructions printed on the back, and forwarded to the Central Repair Depot, and obtain from the Equipment Officer there the address to which the (a) engine, (b) machine, (c) either, (d) both, (e) details, (f) spares, (g) packing-case, (1) type "A," (2) type "B," is to be sent, and whether the machines are to be sent totally dismantled, packed in cases, dispatched in scenery trucks, sent per road in furniture vans, or sent per parcels post (see Post Office Regulations for size, limits and weight).

Any machine for which a spare engine is available, and for which allotment has not been received, should be dispatched to the aerodrome most difficult of access, and which entails the longest and most expensive railway journey from your factory.

In following out these instructions, contractors may find that occasionally there may be some Slight delay between the Completion of a machine and its final allocation, and the Aeronautical Flitterate wish to point out that although it is of the utmost importance that the output of machines should be as great as possible, it is most imperative that these instructions should be implicitly carried out, and in order to reduce any delay to a minimum, the following explanatory memorandum on dispatching machines and spares has been compiled by the Central Aircraft Allocaterate for the use of contractors.

DISPATCHING.

Spares.—From an official standpoint, these are a necessary evil, although there are indications in the various reports submitted to headquarters that, from the contractors' point of view, they are an unmitigated nuisance.

Being somewhat of a ubiquitous nature, and the supply being regulated by the demand, like extras at a dance, contractors may find it difficult at times to know whence they come or whither they go, and, therefore, it is pointed out, that if they do not wish to be caught bending, they must follow implicitly the Allotmentary Instructions given herewith.

Wings.—These will be dispatched according to instructions, in complete sets when you can get them, or on the instalment system, which seems more popular, complete to their respective schedules, i.e., if the contractor can assemble, pack, and dispatch a given set in the interval between any two consecutive deliveries of letters from headquarters, plus alterations, notifications, amendments, etc., with the class 1 job thrown in as a star turn. As wings are over the size limit for parcels post, it has been found necessary to pack them for dispatch in what are known as sets, "A," "B," "C," etc., in rectangular cases made of timber, which, when assembled, are easily recognised by their similarity to a large box.

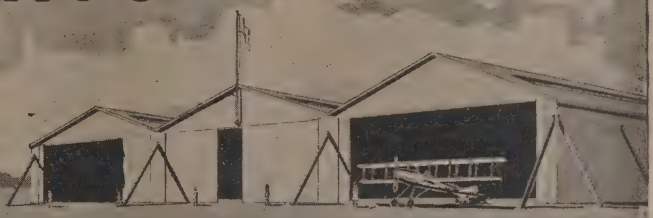
Packing.—As there appears to be considerable dubiety amongst the experts as to the moisture resisting properties of dope, it has been decided to cover the cases on the inside surface with an approved waterproof paper, which must fulfil the following conditions:—

The paper, of an approved width and weight per square foot, must first be coated with "Tarareo," which can be obtained from the R.A.F., who will also issue instructions for its application. After the paper has been evenly coated, a layer of coarse mesh flimsy linen is to be evenly spread over the Tararoed surface to reinforce it, and, after being thoroughly dried, it must be tested as to its moisture resisting properties by fixing a portion to a stoutly-built wooden frame, 2.57 in. by 2.604 in. over all, made of 3.92 in. by 1.76 in. specially selected silver spruce. The paper must be fixed to the edges of the frame by $\frac{3}{8}$ in. tinned tacks with flat heads, 0.701 in. diameter, spaced 2.507 in. centres, the tacks to be passed by the A.I.D. on a 10 per cent. basis and a lead seal with W∧D stamp to be affixed to each packet.

The frame thus prepared is to be placed at the base of some building, not less than six stories in height, with the covered surface uppermost, supported at each corner by wooden blocks 1.749 in. deep.

A section 17 man will then ascend to the roof with a two-gallon water-can, fitted with a special rose, which will be supplied by the Atmospherical Research Waterate, acting on instructions from the M.B.2 Meteorological Statisticate, who will specify the diameter and spacing of the holes therein in accordance with the average rainfall for that particular district.

The examiner, after duly noting the time of day, date, direction and velocity of the wind, and whether dull, cloudy or overcast, will proceed to tilt the water-can to such an angle as will project the water in a steady flow onto the covered frame below, at the same time oscillating the can and making a gentle noise through his teeth like rain.



When the two gallons of water, which must be of 1.001 specific gravity, have been projected onto the frame, that latter must be carefully examined on the under surface for any dampness, and, if found to be perfectly free from any signs of moisture, a 56-lb. weight is to be placed in the centre of the frame, on the paper, and note taken as to the tightening properties and tenacity of the latter as it dries. If, in the opinion of the examiner I/C, the tests have been satisfactory, he is empowered to stamp it every 12 inches without sending any test pieces to the M.B.2 department for further expert opinion. The W.P. paper, as now approved, is to be applied on the inner surface of the packing-case horizontally, with the seams towards the centre of the case, and fixed with similar tacks and spacing as used in the test frame.

After contractors' probationary period with complete machines, the actual packing of the wings will be comparatively simple, but before the lid is put on the case, two very important items of official procedure must be carried out: (A) the inspection and release note must be made out in sextuplate, according to instructions contained in my letter, 9716/Multiplicity/A.E.R.O.—2S., Dy. It will be noticed that these copies are to be reproduced by the use of carbon tissues, and they will, therefore, be "Exact Duplicates," and, starting with the top copy, they will officially be known as Nos. 1, 2, 3, 4, 5, 6, etc.

KINDLY MENTION "THE AEROPLANE" WHEN CORRESPONDING WITH ADVERTISERS.

They must be dispatched to their respective departments in the order indicated, and on no account, for instance, must No. 2 be sent in place of No. 5, or vice-versa.

(B) As there is considerable divergence of expert opinion as to the best position for the packing note in the case, in order to obtain uniformity of procedure, the Interim Assistant Deputy-General Controller Packing Case-Inspectorate instructs me to inform you that if there remains the slightest shred of doubt as to your capabilities of coherent thought, the following epistleatory premium on your intelligence should for once and for all dispel it.

Telegrams "Hopeless,"
Aeronautical Wandered Department,
Mentality House,
Luney Circus, N.S.E.W.

Sir,—In view of the fact that Release Notes have been occasionally returned unopened in the material in which they have been packed, it is considered advisable to place them where they are least likely to be found.

As this procedure has been adopted very successfully by Messrs. Ideas and Thinks, Ltd., it is suggested that the proceeding could be followed with advantage by other contractors.

As it is possible that a case may be opened backside foremost, or upside down, careful search should be made for the Release Note both inside and out, and in order to facilitate this, a special War Bonus should be granted to those employees who, owing to a well-spent youth, are able to walk on their hands, and, in addition, an acrobatic badge is to be issued to those who have acquired inverted dexterity with their feet.

(Signed) Houdini Blondin,
Captain and Acting Adjutant,
PACKING CASES.

Under normal conditions when dispatching machines by rail, whether completely, partially or totally dismantled, a packing case will be necessary, so for this purpose and for use as scratching houses, store rooms, workshops, etc., thereafter, the R.A.F. issue plans for the construction of cases under A.I.D. inspection. The plans are covered with a full complement of details; but in order not to give useful information to the enemy the grain of the timber and the price of the case have been omitted, the former can be obtained from the wood expert, and the latter from the office boy I/C.

They are designed to give the maximum amount of perplexity with the minimum amount of utility, and their chief characteristics consist of a roof, floors, two ends, two sides, and six brass padlocks with 12 interchangeable keys. It will be noticed that although the metal connections generally are very light in construction, the padlocks are of the most expensive, double lever, sliding escutcheon, heavy brass type, and if they appear somewhat excessive for keeping honest persons from entering the cases, on the other hand, they stamp the whole caboodle with that unmistakable departmental *toute ensemble* vapidity which entitles them to annex the latest creation in war pastry.

When applying for aeroplane packing-cases the contractor must fill in Army Requisition Form No. 705602 C, stating his definite requirements for a definite period for a definite output, which, owing to the regular and systematic receipt of material, is quite a simple matter, also stating in the respective columns, whether for nacelles or planes, or either, or both, and also type of case required, if assembled or dismantled, and, if the latter, whether the contractor prefers the correct parts, comprising the cases numbered accordingly, or whether, for the sake of variety and in order to increase output, he prefers them scientifically variegated, say, an L.B. bottom, G.X. sides, F. ends, P.B. roof, with a jumble box of connections and a "go as you please" bundle of posts.

It is pointed out that a combination of this sort provides considerable scope for display of individual ingenuity on the part of the erectors in their frantic endeavours to go one better than Euclid, by vainly trying to prove that "things which are unequal, are equal to one another."

Contractors' attention is drawn to the fact that, owing to the infallible official methods and the unlimited use of innumerable different kinds of forms (supplied in pads of 300), that whatever they do receive, it will not be what was asked for. But they will note that, whatever the type, quantity, quality or condition of cases they do eventually receive, unless receipt of same is acknowledged on the special forms of "Periodical Rambles of Packing-cases on Hire," they must officially understand that they have "NOT" received them, and the A.I.D. Section 3 Inspectorate cannot pass the packing of a machine however efficient, in a case that officially the contractor does not possess.

Although you may have hitherto packed and dispatched a hundred or two machines successfully without any expertorate assistance, it appears that, according to procedure in fashion at the moment, in applied packingetics your education has been sadly neglected, hence the A.I.D. have had to evolve a new form of frightfulness to wit, the Aeronautical Pactorate, whose procedure promises to be as wonderful as the working of a half-crown watch, for no matter how expert a contractor may be at home after work hours on a flitting day, the consensus of opaque and translucent conferencial opinion seems to be that in the science of packingetics your right hand knoweth not what your left doeth, and, therefore, you must render unto Cæsar the things which he spends 75 per cent. of his time filling in forms to convince you are his, by informing him periodically when a machine is ready for internment under Section Something Inspectoration, upon completion of which he must transmit to the Aeronautical Pactorate a sworn statement enumerating the following packingosities, stating which of the following official methods of placing the machine in the case is adopted :—

(a) Dismantle the machine and pass it through the small door.

(b) Remove the brass padlocks and give the machine a state entry through the front (?) end.

(c) Or vice versa through the rear (?) end, or

(d) Lift the case bodily up minus its floor, enthrone the machine on the latter, and then lower the case down over the machine again, the main desire by this time being to bury it, if not out of mind, at least, out of sight as quickly as possible.

(e) Whether the machine is packed upside down or inverted.

(f) Backside forward or 'tother way round.

(g) On its nose or on its tail.

(h) Whether it is packed at all or slung to the roof in order that the Transport Officer may creep underneath it when searching for the Packing Note.

(i) If by any or all of the methods detailed in Clauses (e) to (h).

(j) State the number of packers, giving their size, weight, religion, and whether married or single.

(k) The width, thickness, texture, pattern, degree of visibility, weight per foot, number of yards in a roll, and how many rolls are contained in a bundle of girth web as used.

(l) Size, gauge, number and colour of clout nails, stating how many to the pound, and, if annealed, state whether held in the packer's mouth during use, and if so, has he, she or they (1) natural, (2) false, (3) or no teeth at all, and to what extent items 1, 2 or 3 affect the total number driven in per minute: (1) with the face, (2) the pane, (3) handle of the hammer, or other percussive tool.

(m) The general state of the atmosphere inside the case during packing under your inspectorate, whether normal, azure tinted or sulphurous, and how far any of these conditions are incidental to (1) viscosity of the dope, (2) acute inspectoration, (3) or lack of betting news.

(n to z) These are to be filled in as required after each postal delivery, according to the new daily procedure instructions, any extra procedure stunt will be communicatel by wire, and, therefore, it is suggested that in order to save time, packers should not start work until the day after,

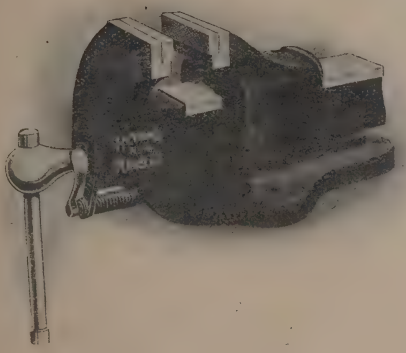
TRANSPORT.

After the case is on the lorry, the examiner must report on the transport appliances, viz., if the fastening is by chain, state whether new or second-hand, or if rope is used, whether Manila, hemp, or ham twine, and, if the latter, state the number of strands proposed, and forwarding a 12-in. length for test.

The wheels must be carefully examined to see that the tyres are not worn beyond the limit allowed on the plan, and that the grease used on the axles is sufficient in quantity and quality for the purpose for which it is intended, and that it contains not less than 74.990 per cent. of lubricating fats, taking one and four-penny margarine as a standard.

The examiner must also see that the nails in the horse's shoes are quite sound, as it is of the utmost importance that no delay should occur between the factory and the station. He must also carefully note whether its tail has been properly combed out, and state the exact shade of ribbon used to tie it up, and whether purchased at a bargain counter with a Class A Certificate, or through the Ministry of Munitions.

Finally, he must examine the horse's teeth most thoroughly, at the same time noting whether its nose-bag is placed on the floor, or on an obsolete pilot's cupboard, when having its one and three-penny lunch, exclusive of water.



As the position and general effect of the address is a matter of supreme importance, the attention of examiners is called to the following notification.

Aeronautical Stencilate,
Ref. 3.Q/Smudge/A.Y., Vandyke House,
Memorandum for Contractors. Room 937.

Sir,—I am instructed by the Deputy Assistant Director-General of Perigrination to inform you that, when a contractor is instructed to pack aeroplanes for immediate dispatch Somewhere, the markings on the case should be imprinted in the position indicated by the Chief Controller, Aeronautical Stencilate, who will forward sample of lettering, figures, etc., giving dimensions, schemes of colouring, shading, and whether Old English, block, Roman or other approved style as may be directed.

It is very important that the said markings should be in position readily seen by the Transport Officer, and I am requested to draw your attention to the fact that, according to instructions,

ON MORE AND MORE AND STILL MORE—II.

Germany's latest politico-strategic move in the development of aerial warfare is to flood the world's Press with accounts of what the German Air Service is going to do in the Spring of 1918. These stories come both from neutral countries and from the actual fighting-front by way of prisoners and, presumably, our Intelligence Department. Doubtless there will be a tendency in some quarters to put the whole thing down as a bluff, but it is well to remember that, whenever Germany has put up a bluff of a similar nature before, as, for example, in the matter of submarines and of Zeppelins, the reality has come within measurable distance of the promises, and has only been adequately met after strenuous efforts on our part, and much unnecessary loss and discomfort owing to delays in our counter-preparations.

The Reuter message from G.H.Q. in France, published widely last week in the daily Press, and reproduced with brief comments at the end of these notes, gives an indication of the line of Germany's preparations. To meet the German threats implied in that message, which has obviously been sent with the approval, and the assistance on technical points, of G.H.Q. Staff, it is necessary for all concerned with the output of aircraft in this country to put forth their best efforts during the next five or six months. If the Flying Services are to beat the German offensive with a stronger counter-offensive, they can only do so if they lavishly supplied with the most up-to-date aeroplanes, as Sir Douglas Haig himself pointed out emphatically in his dispatch at the end of last year. And we must satisfy the demand for more and more and still more aeroplanes, of which Lord Cowdray spoke.

The Mastery in the Air.

The maintenance of "the mastery in the air"—the phrase is Sir Douglas Haig's, although Major Baird scoffed at it afterwards—depends on the masters and men in the aircraft factories in this country, and I would earnestly beg the chiefs of all aircraft works to impress this fact on their employees. The war in the air must be won in the workshops of England—or Scotland, as the case may be. The best insurance against bomb raids is a bigger output of British aeroplanes of war. To stop the Hun from coming to this country we must stop him where he starts.

If we were Americans we should have a whole string of such aphorisms printed in large letters and stuck up all round our factories. The Americans are great on driving home essential facts in such ways, as for example the famous warning in the tool-store of a factory which reads: "The Lord helps those who help themselves; but the Lord help anyone found helping himself here." Or the equally famous warning at the doors of a goods-lift: "Workers are earnestly requested not to fall down the elevator." Little as I believe in posters, and contemptible as have been the official efforts to encourage recruiting, food saving, subscribing to war loans, and so forth, by means of vulgar, bathetic, puerile, or sickly-sentimental posters, I do believe that a series of short, pithy sentences, driving home the need for more and more aeroplanes, if fixed prominently in aeroplane factories would stir the aeroplane workers to further efforts—especially if it were made perfectly clear that they themselves rather than the soldiers in the fighting line would suffer if output were not increased very greatly.

Self-preservation is the first law of nature, and the worst slacker will work like a nigger if he once understands that his safety depends on his output. More aeroplane raids will certainly take place before long, and I hope that factory managers will use the opportunity to point the moral that only the workpeople themselves can protect the workpeople. That is the one great fact that our poster-loving Governments have never impressed on the people.

National Aircraft Factories.

Meantime there are other matters concerned with output which deserve discussion. Recently, in the course of an argument on output, someone mentioned the idea of national aircraft factories, on the line of national shell factories. I have purposely avoided mentioning the subject to anyone who was likely to have any official knowledge of such an official intention, if it exists at all, for the good reason that any information so obtained would naturally prevent me from discussing the subject in print. Therefore I write without in the least knowing whether such national factories are under consideration or not. It is to be hoped that they are not.

National aircraft factories would, it is to be feared, prove a national danger. They would, in the natural course of affairs, have first call on all material and labour, which would mean curtailing the supplies of the established and successful firms in the aircraft industry. It is now, I believe, recognised officially that the best aeroplanes, both as regards aerodynamic and detail design, have been produced by the industry. Also it is known that "trade" firms beat official establishments as regards output, not only in aircraft, but in shipbuilding, gun making, ammunition making, and everything else pertaining to war material.

The Royal Aircraft Factory.

There is every reason for retaining the Royal Aircraft Factory as an experimental establishment, and even for increasing its output of certain machines, engines, and parts, because in the first capacity it acts as a useful pacemaker for the aircraft industry by producing new designs for the "trade" to beat, and in the second, if it is allowed to produce on an increased scale, so that its costs are reduced to something like a commercial

basis, it provides a kind of datum-line from which to judge "trade" prices for contracts.

The R.A.F. might, in fact, be used to even greater advantage than it is, by turning it on to produce experimental mechanisms of outside origin. For example, a new engine, or aeroplane, or accessory gadget, may be approved by the authorities concerned, and yet it may be impossible for the inventor or his backers to get it made, owing to all the firms capable of making it being already too full of work of their own to touch an experimental proposition. Such experimental work might well be carried out at the R.A.F. under the direct supervision of the inventor.

If the inventor or the owner of the invention happened to have money, or had good financial backing, he could pay for the work done, and the invention would remain his own and his partners' property, with which they would be free to trade with any firm in the aircraft industry or with the Government. If the inventor was unable to pay for the work, then, if it proved a success, the resultant product would be Government property, subject to a fair recompense to the inventor-designer, either in cash, royalties, or in the shape of a Government job concerned with his invention—or all three, or any two.

By some such arrangement much time could be saved which is now spent in hawking really valuable inventions round from firm to firm in the aircraft industry before one can be found to take them up. It must be recognised that only one invention in 10,000 is any use at all, and that only one in a hundred of the useful ones are of outstanding merit, but even so that one in a hundred thousand generally has to be hawked around nearly as long as if it were useless, and frequently the glib-tongued inventor, or the inventor with political pull, manages to get a useless invention taken up while a valuable invention is still on its peregrinations.

The Inventor-Squashing Department.

It might well be cheaper and quicker in the end to have a special department at the R.A.F. for the testing and squashing of inventions by actual proof than to have inventors continually bombarding busy technical people with the same invention over and over again, first through one department, then through another, then through the local M.P., then through some Government official or other. It might even be worth while to publish a list of the utterly impossible inventions which have been turned down time after time.

I could supply quite a nice little list from this office alone of people whom I have endeavoured to swat to prevent them from buzzing round Inventions Boards and suchlike long-suffering people. For instance, there is the gentleman who wants to fire shells loaded with sand at German raiders, so that the sand will "get into the bearings of the engines and wear them out." And there is the equally interesting gentleman who wants to fire shells loaded with asbestos fluff, so that the fluff will choke the gauze inlets to the carburettors. Some substitute carborundum for sand, as having greater cutting effect, and others substitute cotton for asbestos, as being cheaper. All forget that if it were possible to get their comic shells close enough to a raider to do him any harm at all, a common or garden high explosive shell would crumple him all up in one bang. And they further forget that if sufficient fluff or sand shells were fired to fill the air with the stuff, our own pursuit machines would have to fly through it as well as the Huns.

Now if all those gentlemen—and there are dozens of them—could be sent down to the R.A.F. to have their inventions tested under their own supervision, it might be possible to choke them quietly with their own sand or fluff, and they might then serve a useful purpose by increasing the output of the R.A.F. allotments. Many other inventors might be made similarly useful if turned loose to experiment at Government expense with their own ideas.

Real Usefulness.

That, however, is rather by the way. To be quite serious, the R.A.F. might well be used to an even greater extent in developing promising inventions. Incidentally the younger generation of aeroplane designers might with advantage make greater use of the R.A.F. than they do. I am told that under the present sympathetic régime every possible assistance is given to the authorised representatives of aircraft firms desiring the latest information on anything to do with the design of engines, aeroplanes, propellers, instruments, or anything else pertaining to aircraft. Here, again, I write without official information, and purely on the testimony of those who have asked for advice or help from the R.A.F. and have got it, promptly and courteously.

It is not likely that any stray inventor of new and weird wing-curves, or any young student of aeronautics filling in his spare time with a correspondence-school course, will at once have the secrets of the R.A.F. laid bare to him, but certainly every possible help seems to be given to aircraft manufacturers, and a friendly welcome is extended to any of their employees who are sent to the R.A.F. for information. It is hoped that this fact will be borne in mind by firms which have a desire to acquire knowledge now, with the idea of remaining in the aircraft industry after the war.

The Small Man's Uses.

However, to return to the subject of the output of to-day and to-morrow, another question of immediate importance is what can best be done with the small man or the small firm? There are hundreds, probably thousands, of workshops in the country all capable of turning out aircraft parts of one kind or another, and yet none capable of making a complete aeroplane or a complete engine. In the aggregate their man-power and machinery power is enormous, and we cannot afford to waste it. Yet individually they are negligible quantities.

At one time it seemed as if the Air Board intended to adopt a highly elaborated form of the French *système globale*, and to turn all these small men on to make parts, which would be delivered to a great central depot and then distributed to the assemblers of the complete article. Apparently this was a wrong impression, for, when one comes to think it over, the staff necessary to deal with such a system would be colossal.

It would work perfectly well if a large number of well-trained, intelligent business men were available, but practically all the men suitable for such an organisation are already fully employed, either in their own businesses or in important Government posts, where they have their hands full already with looking after untrained staffs of their own.

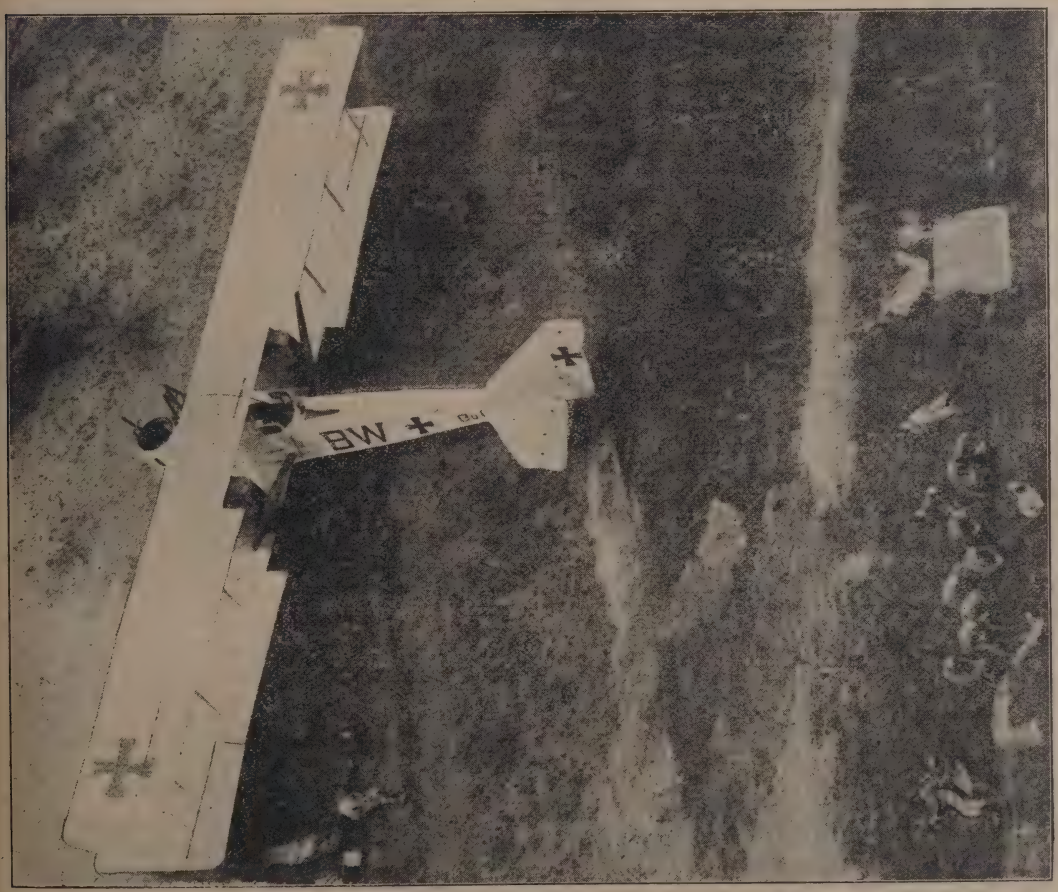
Sub-contracting.

Therefore the only workable way out seems to be to encourage the system of sub-contracting, as appears to be the official method at present. Where a firm has made good as a direct contractor with the Government, has successfully expanded its business, has increased its output in proportion to its surface expansion, has taken on the teaching and organising of small firms sub-contracting with it for parts, and has shown its ability to carry on its business in a businesslike way, there is good reason to suppose that such a firm can expand its operations still further. Therefore it seems sound policy to encourage that firm to develop its system of sub-contracts rather than to start opening up hundreds of fresh small accounts direct with small workshops.

The successful firm has already proved that it possesses organising ability, and therefore it seems wiser to rely on that organising ability to organise still greater output than to start up more and more offices full of untried officials. In other words it seems better to let the big and successful firms develop themselves into miniature Air Boards on their own accounts all over the country than to try to centralise all the detail control of every little workship in the country inside the Hotel Cecil. Therefore, if any of my readers who own small workshops are anxious to do aircraft work of any kind, I recommend them to tackle any of the big aircraft concerns in their neighbourhood and ask for sub-contracts, rather than worry to get direct Government orders.

The Better Proposition.

It is really a better proposition in the end for everyone concerned. Although there will certainly be a big and healthy market for aircraft after the war, especially if the Civil Aerial Transport Committee does anything to justify its existence, one cannot expect orders to flow in as they are flowing at present. Output will have to be reduced to a fraction of its size to-day. A firm which is entirely self-contained will find much of its huge workshops standing idle—at any rate, for several years after the war.



On the other hand, a firm which relies largely on sub-contractors will find itself in a far better position. All the little sub-contractors will want to get back to their original trades, making bits of motor-cars, or tin cans, or lavatory fittings, or what not. The result will be that the direct contractor's works, which have to-day become merely an assembling shop for parts from sub-contractors, will again become a manufacturing shop, and will probably find enough business to keep it quite comfortably busy during normal working hours. And it will probably show quite respectable profits.

The over-developed factory, however, will have to find fresh business of some sort, and may possibly have to side-track itself onto a different trade altogether, and so will not be in a position to handle its share of the aeroplane trade when the boom in civilian flying comes along after the slump which is almost certain to follow the present war-boom. Apropos which change-over of occupations, here is an illustrative story which still seems to be new to many people.

A Ford Story.

Two wicked munition-profiteers were discussing how best to invest their ill-gotten gains so as to get as much as possible out of them after the war. "Well!" said one, "I'm laying down my plant to turn out steel shrapnel-helmets by the million."

"Man! You're mad!" said the other. "The war can't possibly last more than another three or four years,

A GOTHA FROM ABOVE.—The attendant crew may be seen resting from their labours. The two projections, one on each side of the after cockpit, are not arm-rests, but appear to be guard-rails to prevent the after gunner from obtruding his gun or person into the orbit of the air-screws.

or five at most. And as soon as peace breaks out no one will want tin hats."

"Ah, that's just where you're wrong!" replied the first. "It's only after the war that we shall find the real market for steel helmets. Everybody will want 'em then."

"How on earth d'you make that out?" asked the second.

"Why," replied the first, "haven't you heard that Henry Ford is laying down a plant to turn out a thousand aeroplanes a day?"

Of course, everybody cannot be expected to have such phenomenal foresight as all that, so a judicious system of sub-contracting may save many a big aircraft firm from financial disaster after the war, because its post-war output will not then be overburdened by enormous dead charges for unusable workshops and machinery. Under the sub-contract system the overhead charges are split up among all the sub-contractors, and will fall away as the sub-contractors each return to their original occupation.

(To be continued.)

German Preparations for the Coming Air Struggle.

Reuter's correspondent with the French Army wrote on October 17th as follows:—

The vital importance of the question of air supremacy for the Allied nations could not be more effectively illustrated than by the following facts which have recently come to the knowledge of the French General Staff.

The Germans are well aware that some time next year the new American air squadrons will come into action on the Western Front, and they are already straining every nerve in order to be able to meet the Allied air offensive next spring.

MATERIEL.

The number of German battleplanes is to be doubled during the coming winter, and the aeroplanes and motor-building factories throughout Germany are enlarging their plant and obtaining reinforcements of labour to enable them to cope with the sudden influx of orders.

Switzerland is being laid under contribution. Two hundred and fifty Argus motors have been ordered from a firm in the Zurich district.

The Fokker firm, which is building fighting biplanes in great numbers, as well as a triplane remarkable for its speed and climbing powers, has taken over the great Berzina piano factories in Schwerin. [Presumably the triplane mentioned last week.—Ed.]

For bombing formations heavy three-seater machines are being built which can carry between seventeen and eighteen hundred pounds weight of bombs. They have Mercédès 260 horse-power motors, and when loaded can climb 12,000 feet in 35 minutes.

[Gothas, A.E.G.'s, Rumplers, and Freidrishshafen products.—Ed.]

In every type of flying machine the Germans are feverishly producing new models for long-distance scouting expeditions. The 1917 Rumpler, with 260 horse-power Mercédès motor, is said to be the best machine.

They are also building a machine, made entirely of metal, to operate in conjunction with infantry on the battlefield. It has no great speed, and is a notably slow climber, and does not seem to be able to rise much above 10,000 feet. [The progeny of the famous "copper-belly" of the Ypres Salient early in 1915.—Ed.]

The enemy is also using a new six-cylinder Maybach motor, developing 240 horse-power, which is lighter than the ordinary Mercédès, and gives greater speed in climbing.

A big German bombing machine which lately landed in Holland was fitted with an electrical installation, driven by motor, for the purpose of warming the aviator. [This system of electric heating is an American device which was fully described in this paper nearly three years ago, and was introduced to the R.N.A.S. and turned down early in 1915.—Ed.]

During the six months from February to August twenty-nine important industrial establishments were added to the number of factories making aeroplanes or their accessories in Germany.

PERSONNEL.

Simultaneously with this great increase in the output of machines, the Germans are looking everywhere for recruits for the flying service. Applications for transfer to the air service are now received from both infantry and engineers, instead of being restricted to cavalry, as was the case not long ago. [So that is why the German pilots have been so much better than was expected during the last year! It bears out this paper's statement, of long before the war, that the horseman makes the best aviator. Also, it seems that Germany has been depleting her cavalry. It seems then that German pilots are not likely to improve in future.—Ed.]

Applications are now dealt with in a month instead of two months, and there is no doubt that, in the course of the present year, the personnel of the German air service has been largely reinforced. Volunteers are wanted chiefly for the fighting planes, because it is chiefly among the fighting squadrons engaged on the battlefields that casualties occur, but a large number of officers are being trained as observers for observation planes. [Also, more fighting will be required in a mainly defensive war.—Ed.]

It is interesting to note that while the enemy is making all these efforts in order to be able at least to hold his own in the air next spring, German commanders are being recommended to use their aviators and machines, for the moment, as economically as possible. An order signed by General von Ludendorff, dated June, which has fallen into our hands, says that the Allies are employing their aeroplanes economically with a view to the great battles of the future.

"We should be wrong (it adds) to overwork and wear out our air formations, which are inferior in numbers, by sending them out several times every day. Consequently, the infantry and artillery must be told that it is impossible to prevent the enemy's planes from flying over our lines, and they must not get nervous when they see them overhead. Aviators are to be used sparingly in calm times in order that Germany may have as many of them as possible for great emergencies."—[All of which is very encouraging from our point of view.—Ed.]

ON THE AIR MINISTRY.

It was officially announced by Mr. Bonar Law in the House of Commons on Tuesday of last week—just too late for the fact to be noted in this paper—that the Government has decided to create an Air Ministry, with the usual accessories. There has been a consistent public demand for an Air Ministry, and now the public is to have what it demands.

There are many, among whom I confess to being one, who cannot comprehend the necessity in time of war for an Air Ministry any more than for an Artillery Ministry, or a Horse Ministry, so far as purely military needs are concerned. In time of peace an Air Ministry may be necessary in order to regulate aerial traffic, just as in more enlightened countries than this there is a Minister of Ways and Communications, or a Minister of Railways, or a Minister of Posts and Telegraphs, but that is another matter.

However, if there is to be an Air Minister, we must all accept the fact and support him, whoever he may be, with the utmost sincerity, as a matter of loyalty to King and Country.

The Air Minister will have no light task, for he will have to reconcile the conflicting demands of Navy, Army, and Air Service for men and material, and he will have to compete with the First Lord of the Admiralty and with the Secretary of State for War in the Cabinet for Governmental recognition of the importance of air operations as compared with operations on sea and land. His work will be of the most harassing nature, and it behoves all who have the welfare of aeronautics at heart to help him to the best of their ability, rather than to hinder him with criticisms or questions, until at least he has had a fair chance of settling down to work and getting his forces under proper control.

As to who the new Minister is to be, no announcement has yet been made, though naturally various

"Sopwith, Kingston"

names have been mentioned as possibilities, or certainties, for the office. Judging from the "Morning Post" of October 20th, the most likely person to be appointed is Mr. Winston Churchill. The "Post" is generally well informed as to what is going on behind the scenes, and the virulence of its attack on Mr. Churchill seems to indicate that the proprietor of the paper regards his appointment as imminent. With the exception of the aforesaid proprietor, and Charles, Lord Beresford, and their immediate following, the rest of the country would doubtless, and certainly the great majority of the Flying Services would, welcome Mr. Churchill as the first Air Minister.

Certainly none has a better right to the job, for Mr. Churchill is the only personage of Cabinet rank who has taken an active interest in aeronautical affairs. He created the Royal Naval Air Service, and left it as a going and growing concern when he retired from the Admiralty. Its subsequent vicissitudes were none of his making. He is himself a capable pilot, and is in close touch with active-service aviators. Moreover and especially he is an ardent believer in Air Power.

His work at the Ministry of Munitions during his few months of Office has been of high value to the Nation, but as Air Minister his quick grasp of situations and ideas, his intense energy, and his earnest patriotism would be of still greater value. In the chiefs of departments at the present Air Board he would find men as keen and as energetic as himself, and, though energetic minds sometimes come into conflict as to methods, there would be great hopes of the earnestness of all concerned succeeding in avoiding friction and working together for the common good in the event of Mr. Churchill being appointed.

In the ordinary course of events, Lord Cowdray, the President of the Air Board, should be the first Air Minister, but it will be remembered that he was on the point of retiring, owing to ill-health, some time ago, and it is said that he only consents to hold office until the new Air Minister is announced. If, however, owing to political friction, no politician is appointed, and if Lord Cowdray consented to remain as Air Minister, such a decision would meet with very general approval, for as chief of the Air Board he has won the personal respect and regard of all who have come in contact with him.

It has also been suggested that Sir William Weir should be appointed Air Minister if Mr. Churchill cannot have the Ministry of Munitions and if Lord Cowdray prefers not to carry on with increased power under the bigger scheme. Undoubtedly Sir William Weir would be an excellent Air Minister. His energy is astonishing. His keenness as a producer is unsurpassed. He is trusted commercially and liked personally by everyone in the Aircraft Industry who has come into contact with him. As an engineer and organiser he has experience and achievement to his credit. Undoubtedly he would make as great a success of the job as anyone could do.

Yet one cannot help thinking that in gaining an excellent Air Minister we should lose a super-excellent Controller of Aeronautical Supplies. Someone would have to take over the work which he has been doing so ably for the past six months, and, though the newcomer would step into a ready-made system of high quality, he would have to begin to learn all the things which Sir William Weir has learned since he took office, and would have to get hold of the ends of all the strings which Sir William has collected and come to know by heart in this period. If Sir William Weir does become Air Minister, all will wish him well, but they will wish equally sincerely that he may find as good a man as himself to carry on his present work.

Naturally General Smuts, as Mr. Lloyd George's right hand, has been mentioned as a likely candidate, and many a worse appointment might be made. General Smuts has had a distinguished political career, as well as variegated experience as a fighting man, so doubtless he would be more than a match for political opponents. One fancies, however, that he is more likely to take over a post concerned more directly with the warlike operations of the Air Ministry than that of political chief.

The name of Major Baird, at present Parliamentary spokesman for the Air Board, has also been mentioned as a possible Air Minister. If one were discussing possibilities, one might also include Mr. H. G. Wells, Mr. F. W. Lanchester, and the successful candidate for East Islington—whoever he may be by the time these notes appear in print—but space is lacking for the discussion of possibilities. Suffice it that whoever may be appointed will have the good wishes and loyal support of all concerned with Service flying.—C. G. G.

A GERMAN VIEW.

Professor Wegner, in an article in the "Cologne Gazette," describing the recent battles on the Western Front, says of the R.F.C.:—

Of aviators also the English had prepared masses in excess of everything known before. This development was sudden, and it took some time before we had caught up with the numerical superiority. The enemy aviators tried to advance in swarms over our lines, but the perfect bravery of our men was able to force them back, and in the main to keep them behind their own lines.

In these days the Englishman directed infantry attacks on a small scale against particular strong concrete defences in our lines which were known to him, his fear being that, when the main attack took place, these concrete defences might, as on former occasions, be centres of a dangerous resistance.

PRESENTATION AEROPLANES.

A contribution of £1,000 towards the cost of the purchase of an aeroplane has been presented to the Government by the Oba of Benin, on behalf of the Native Administration of Benin in the Southern Provinces of Nigeria.

A Reuter message from Simla on Oct. 20th states that the Jam Sahib of Jamnagar has generously offered the Government a lakh of rupees (£6,666) to purchase aeroplanes for use on any front. The offer has been gratefully accepted.

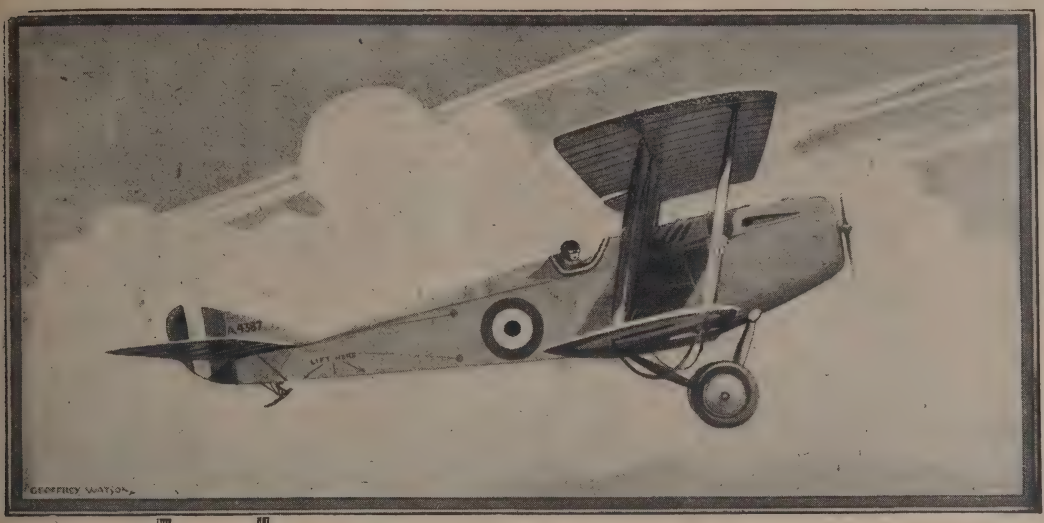
ITALY AND THE U.S.A.

On September 13th Captain Resnati, who is at present demonstrating a Caproni triplane at Norfolk, Va., remained in the air for six hours with ten passengers—a world's record. During this time he flew all over the Virginia peninsula, out to the Virginia capes, and far into the country.

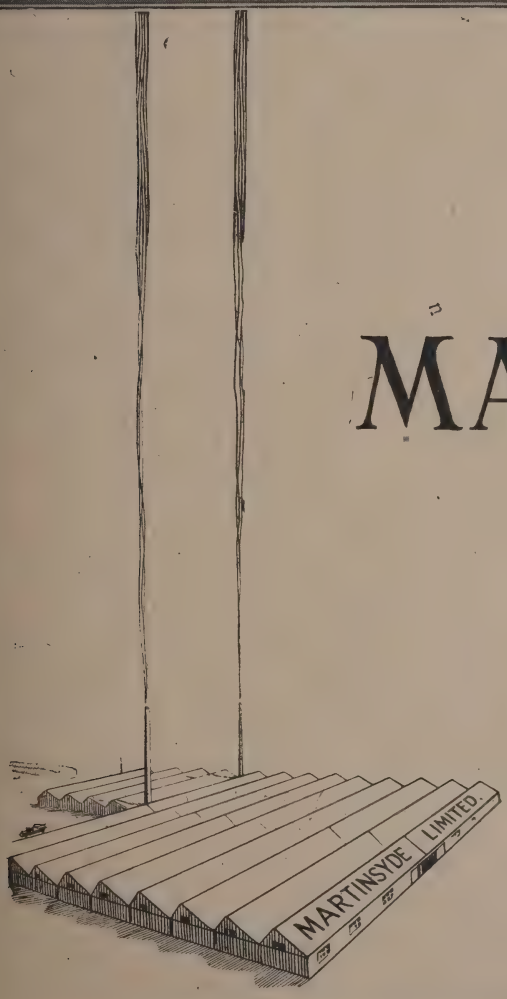
On September 24th Captain Resnati carried twenty-four passengers for a distance of 50 miles near Norfolk, Va.

AN AIRMAN'S OUTINGS.

Under the title of "An Airman's Outings," an officer of the Royal Flying Corps, who has adopted as *nom-de-plume* the order "Contact," has written something of his experiences abroad.



The book has a brief but pithy and thoughtful preface by Maj.-General W. S. Brancker, who points out that the stories told therein are part of the annals of a squadron which for a time held a record in the heaviness of its losses. He concludes with the sentence, "War has been the making of aviation. Let us hope that aviation will be the destruction of war." A curious and yet a fine sentiment from a soldier of proved gallantry.



The author tells his story in plain, matter-of-fact language, with absolutely no pretence at what is usually called style, and with Spartan brutality which would ill become anyone who had not faced death many times himself.

The dedication is characteristic of the whole book. Who, but a soldier, would dare to dedicate his work to "The Fallen of Umpty Squadron, R.F.C."?

The subject-matter, viewed as ante-room talk, is full of interest; as literature it is at times regrettably but truthfully slangy, but as a record of active service flying by one who really knows what it is, the book is extraordinarily fine stuff.

KINDLY MENTION "THE AEROPLANE" WHEN CORRESPONDING WITH ADVERTISERS.

On the Press, Politicians, and the Zeppelin Raid.

Never in a long and contemptuous career as a newspaper reader have I come across as much pure unadulterated tosh on one subject in a few days as has been published on the Zeppelin raid of Friday last. Considered purely as a sporting attempt to rehabilitate the big airship in the esteem of the German Government and people, the raid was rather a good effort. But considered as a raid it was very much a wash-out.

It was up to the airship people to prove that they can do all that aeroplanes can do and more, if the German airship programme is not to be curtailed in order to increase the aeroplane programme. In this they failed badly, and merely proved precisely the limits of airships. If an airship keeps so low as to be within sight of the ground it is at the mercy of searchlights, guns, and aeroplanes. If it goes so high as to be difficult for its enemies to find, it loses itself.

Judging by published evidence it appears that one airship kept low, for it was heard crossing Holland. It thus remained in the comparatively still air near the ground and sea, and was able to make headway towards its home, presumably in Northern Germany as the Belgian and West German airship sheds are now in the danger zone. The others apparently went up high to be out of danger, and so found the prevailing air-current which blows at night even when the cooling of the earth and the air near it has produced a calm.

During the day the wind was blowing from the North of West. As Lord Montagu pointed out in his lecture some months ago, as one reaches higher altitudes one finds the air-currents stronger and always taking a clock-wise twist, so that at the extreme height reached by the airships the wind was probably blowing from the North. Plugging steadily on a compass-course for Northern Germany, the ships were blown South as fast as they went East, and consequently when they came down at dawn to discover their whereabouts in Germany, they found themselves far towards the South of France. By that time several of them had exhausted their petrol, so they had to land or be carried into the Mediterranean. The lucky ones managed to scrape into Germany somehow. And that is about all there is to it.

Press Comments.

The "Times" starts its leading article by saying "Zeppelins have once more bombed England, but France has routed them," and says later "The public, therefore, ask why Zeppelins can be destroyed in France and not in England," and "we should welcome some further assurance of the present ability of our own air organisation to emulate the example of our Allies." The reply to the doubt implied by the "Times" is the very simple one that our gallant French friends were operating in daylight, that we were not, and that, despite this, two airships, out of three attacked, eluded them and escaped. If one had some further assurance of the present ability of the organisation of the "Times" to run a newspaper as well as "our own air organisation" is run, one would feel very much better satisfied about fitness of that journal to discuss aeronautical affairs. For all the credit given to the French Service d'Aviation it appears as if the other Zeppelins landed in France more through an act of God than of their enemies, excepting the one which shot down in flames near Lunéville. Which is no discredit to the Service d'Aviation, who probably never saw most of the airships at all till they had been landed and burnt by their crews.

The "Daily Mail," as one might expect, is still further wide of the mark. It says "the collapse of our arrangements on Friday night must be admitted. Lord French has a serious failure to explain." "We know from long experience that our airmen could not have been given a fair chance, or they would have accounted for some of the Zeppelins." "This much is certain—that an air raid is an operation for an air-staff to meet, and we shall never have a real air-staff until we have an independent Air Service." To all of which one might equally well say that we shall never have a real newspaper-staff till we have an independent newspaper free from political interests.

Whence does the "Mail" think this wonderful air-staff-to-be is coming, except from the existing Flying Services. It is difficult to see where the Imperial Air Service, or the promised Air Ministry is to find a better "air staff" than that which is running Service aeronautics to-day, unless it distributes commissions among the angels, and appoints St. Michael Director-General.

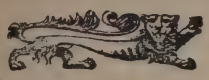
It certainly will not find better people inside the Flying Services, and only a born fool would imagine that better are to be found outside those Services. To say that Lord French has a serious failure to explain is about as reasonable as to say that Sir Douglas Haig has a serious failure to explain because the recent pushes in Flanders have not captured the whole of the Passchendaele Ridge, and have not captured Staden and Roulers.

Presumably, it has never occurred to the "airmanship expert" of the "Mail" that three or four bombs sprinkled blindly over London may be preferable to the descent of a whole load of bombs, plus some two hundred yards of burning Zeppelins, plus some hundreds of gallons of blazing petrol in a crowded area. Nor, perhaps, has the said "expert" discovered that only the Germans, with their nerves on the jump, let loose a whole artillery barrage because a small patrol has been spotted crawling towards the German trenches, and so disclose their artillery positions to our aviators. So far from our arrangements collapsing on Friday night, the probability is, if one only knew the whole story, and could publish it, that never have our arrangements worked more sweetly. Evidently, the "Mail" has a serious failure to explain in the way in which its editorial authorities have dealt with the Friday night raid. It is quite time that Lord Northcliffe came back to England and rapped some of his employees smartly across the knuckles.

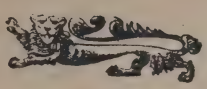
Even the "Daily Express," which has of late been doing valuable work by consistently advocating raids on Germany, and has thus helped to swamp the Bishops and other "conscientious objectors" who are afraid of hurting German munition-makers, ran a bit off the rails, and asked: "What is the matter with the Air Command"? It also talked of "marauders . . . absolutely unmolested by the British Air Command," said that "The French Air Command was on the alert, and the achievement was magnificent," and wound up with "The remark of a naturally irritated and harassed Air official that it has nothing to do with the public will not do. It has everything to do with the public."

One quite agrees that it has everything to do with the public. And the thing that has most to do with the public is that we should not disclose for the benefit of the enemy, nor even indicate ever so slightly, what precisely were the tactics pursued on Friday night, and what was the larger strategic scheme behind them.

As to the rest of the Press, the columns of tosh turned out, from the descriptions of wholly impossible "aerial torpedoes" to the stories of frozen petrol, and ice-embedded German corpses falling from wrecked Zeppelins in France, would be exquisitely funny if one did not realise that the majority of people believe what they see in print. The old adage, "Believe half of what you see, and nothing that you hear," applies admirably to the British public as concerns its relations with aerial matters in general, home defence in particular, and the daily papers pre-eminently. Certainly, in its own interests the lay Press would be well advised not to go off at half-cock on the subject of matters about which it knows nothing at all.



In Parliament.



On the evening of Oct. 23rd, the House of Commons let itself loose on the subject, with about as much "savvy" as the Press. Sir George Cave, the Home Secretary, who is one of the few politicians for whom one can feel any respect, explained that five Zepppelins reached the neighbourhood of London, and that only one crossed over any part of London—which ought to have explained the situation clearly enough to anyone with common sense. Mr. Macpherson (Under Secretary for War), another trustworthy official, told the House that our aeroplanes were up throughout the raid. Mr. Billing, as ever a humorist, asked whether the Government would give special instructions for the safe custody of ballot-boxes.

These official replies, however, did not prevent Sir F. Lowe, who comes from Birmingham, from moving the adjournment of the House, and finding the necessary forty members to support him. Though such forty have not been found to support a similar motion on much more important matters, they cropped up quickly enough on what they were pleased to consider "the inadequate defence" against this air raid. Sir F. Lowe expressed his surprise that there was "no firing of anti-aircraft guns, nor any attempt to disturb the assailants in their diabolical proceedings," and more to the same effect. Mr. Joynson-Hicks remarked sensibly that the real defence was an attack on Germany, and asked for more information.

Mr. Dillon, of Mayo ("God help us" is every Mayo man's motto), speaking on behalf of all Londoners, said that "on no previous occasion was the defence so helpless as it was on Friday night," and that he was "an absolute sceptic as to the impossibility of stopping these attacks." Perhaps, as Mr. Dillon has such beliefs, he will evolve a scheme for stopping Sinn Feiners.

Mr. Austin Chamberlain, another Birmingham man, preached the usual official platitudes about the admirable attitude of the people of London. Admiral Sir Hedworth Meux, with all the cock-sureness of the Naval officer discussing somebody else's job, said that "the sooner the barrage was done away with the better," and did not believe there was a military man who believed in it. Mr. Bonar Law, displaying his customary mental attitude of the retail ironmonger, made great play with the fact that "only last month we dropped behind the German lines no less than 8,000 bombs," an argument quite worthy of a mind which would rather deal in tin-tacks than in ferro-concrete barrages. One almost regrets to find him agreeing that raid-

on German towns are a real defence. It shakes one's faith in the efficacy of such raids.

Plain Common Sense.

However, as a leading politician on the Government side he was evidently primed with really reliable information, for he pointed out that when once a Zeppelin has gone to 17,000 feet or more she cannot reach that height again, so that when these ships reached France they were lower down than when in this country and were quite easy to find in daylight, though one was over Lyons in the dark for a long time and was not found. Also he pointed out that there is no sense in firing guns just because Zeppelins have crossed the coast, or turning on searchlights when it is found that they cannot get through a ground mist to the height at which the Zeppelins were flying. He added "What my hon. friends want is that they should put all the searchlights on in order to let the commanders of the Zeppelins know exactly where London is, and enable them to drop bombs on London."

So much is plain common sense, and whoever supplied Mr. Law with the information is to be congratulated on so clear a statement of fact. I wonder whether any official person will have the sense to issue these explanations to the Press as regular communiqués, to convince the mob that the defences are being properly handled.

On the whole the defences seem to have been handled most skilfully, and with evident regard to a proper scheme of anti-aircraft warfare. A new branch of the great science of war is being developed, and we are evidently doing well at it.

My only personal contribution to this discussion is the suggestion that we should renew our investigations into the possibilities of all-night patrol aeroplanes, of an improved "Night-Hawk" type—a type which cannot be discussed in print.

C. G. G.

THE ODYSSEY OF THE ZEPPELINS.

A Reuter telegram, dated Paris, October 21st, says:—It is now clear that the 11 Zeppelins which flew over French territory had come from England. It appears that the expedition against England was impeded from the beginning by a fog which covered the greater part of English territory. They lost their way completely, wandering aimlessly over England during the night, and their retreat was transformed into a disaster by the energy of the French defence forces, both aerial and anti-aircraft.

Three of them apparently escaped, but at dawn there were still eight Zeppelins on French territory. Of these, three, which kept company, attempted to cross the French lines between Lunéville and Baccarat. One of them was brought down in the environs of St. Clément by section 174 of the anti-aircraft defences. The two other airships escaped, but were attacked by four pilots belonging to Squadrons 77, 91, and 89, who caught and attacked one of them at a height of over 16,000 ft. Their ammunition giving out, the pilots were compelled to abandon the fight, but though lost in a fog they made a safe landing.

The five other Zeppelins remaining over French soil, attacked or worried by aeroplanes, were brought down or so disabled that they were compelled to land. L49 landed at 10 o'clock at Bourbonne-les-Bains, and was captured intact by French pilots. Her crew were made prisoners. L50 fell at Dammartin, near Montigny-le-Roi, at 11 o'clock in the morning. One of her gondolas caught in a tree whence it was torn off and fell. Two officers and 14 men of the crew had already reached the ground, and the Zeppelin thus lightened rose to a great height carrying with it four of the crew. She was, however, completely disabled.

Two other airships were sighted in the south of France. The first landed at Laragne, and the other was seen at four in the afternoon by the aviation centre of Fréjus, near Toulon. A fighting squadron at once rose from Fréjus in pursuit, but lost sight of the airship about five o'clock in the afternoon. She was then drifting towards the open sea travelling in a vertical position. If this, as is probable, is not the Zeppelin of Montigny-le-Roi, whose envelope and remaining crew have not been found, then the Germans yesterday lost five Zeppelins.

A Reuter telegram from Grenoble, dated Oct. 21st, says:—"Zeppelin L45, which came down on Saturday in the Mison district, measures over 656 ft. in length, and has three motors. The crew consisted of two officers and 15 men of the German Navy. When it alighted the crew made haste to set fire to the envelope with special pistols loaded with incendiary bullets, and then gave themselves up as prisoners. The height-measuring instrument which was found among the burning débris shows that the airship had risen up to a height of over 20,000 ft.

A telegram, dated Paris, Oct. 22nd, says:—The questions put to the crews of Zeppelins L49 and L50, who were taken prisoners, have thrown fresh light on the German raid.

The enemy, it appears, carried out their latest expedition with a fleet of 13 naval Zeppelins. The airships left separately on the evening of Oct. 19th, and, no doubt, from three different bases, as usual. The night was pitch black when they set out; they never go out in moonlight. The raid was expected to last from 20 to 26 hours. The Zeppelins made for the English coast, which they recognised by the lights. They were much worried by the British anti-aircraft fire, and especially by the many searchlights. Then it was that they dropped nearly all their bombs.

The fleet was flying at a height of over 16,000 ft., when it was suddenly struck by a strong north-east wind. The Zeppelins tried to get back to their bases, but the contrary wind made progress slow. At dawn the L49 thought she was near Holland or Westphalia. She came down fairly low, and the crew waved white flags. It was only between 8 and 9 o'clock that the commander realised that they were in France. Moreover, just at that moment the L49 was sighted by several French aeroplanes, which speedily forced her to land.

Soon after the L50 passed over the L49, which was then surrounded by French aeroplanes. The L50 manœuvred to try to land in a neighbouring wood in order to let the crew escape in the best possible conditions, but one of her gondolas got caught, and some of the men in it landed by parachute.—[Parachuting out of a tree must be a good game.—Ed.]—The gondola was then destroyed by incendiary pistol bullets.

The officers adopted a very arrogant tone, and demanded special rooms and special treatment at the hotel. They were greatly surprised when they were treated as prisoners.

It should be noted that the prisoners' statements show that the raid was carried out by 13 Zeppelins, but two of these must have returned directly to their base, as only 11 Zeppelins flew over French territory.

The two airships L49 and L50 belong to the class of super-Zeppelins. They measure 196 metres (650 feet) in length, and their cubic capacity is 55,000 cubic metres (nearly 2,000,000 cubic feet).

The crew belong to the Navy, the majority of them being warrant officers who have followed special instructional courses. They were warmly clad in leather garments with fur underneath.

THE R.N.A.S. COMFORTS FUND.

The recent appeals for contributions in aid of the R.N.A.S. Comforts Fund have brought to hand some very useful contributions, and it is sincerely to be hoped that others will feel encouraged thereby to contribute further to the good work.

Since the inauguration of the Fund in 1914 the personnel of the R.N.A.S. has expanded many times over, and therefore an increasing amount of money will be required if each man now in the Naval Air Service is to receive gifts of clothing and other comforts on as liberal a scale as hitherto.

Gifts of warm woollen clothing in blue and khaki are also solicited, and those who are only able to contribute a small amount in money will make their contributions go considerably further if they undertake the making of garments themselves, and so save the cost of manufacture. Contributions, both in cash and kind, should be sent to Mrs. Henry Balfour, Langley Lodge, Headington, Oxford. The following contributions and other receipts are announced, which brings the grand total to £5,109 9s. 7d.:—

Brought forward, February, 1917, 4,855 10s. 11d.; Mr. F. E. Rosher, per sale of "In the R.N.A.S.," £25; Messrs. Child and Co., per Mr. Fane, £21; Lady Samuel £10 10s.; Mrs. Sueter, £10; Sqdn. Comdr. Oliver (proceeds of concert), £8; Admiral and Mrs. Mark Kerr, £5 10s.; Mr. W. H. Kendal, £5 5s.; Mrs. Dobell, £5; S. Samuel, Esq., M.P., £5; General Sir C. Mansfield Clarke, £5; Mrs. Edmonds, £5; Duke and Duchess of Sutherland, £3 3s.; Matron and Domestic Staff of the Royal Infirmary, Bradford, £2; Lady Walker, £2; Mrs. W. Levy, £2; Capt. and Mrs. McLaughlin, £2; Admiral Sir Edmund Freemantle, £1 1s.; Col. Sir Mathew Nathan, R.E., £1 1s.; the Hon. Lady Barker, £1; refunded by Mrs. Mackworth, £125 12s. 1d.; refunded per Messrs. Wyatt, £7 10s.; refunded petty cash, £1 6s. 7d.; total, £5,109 9s. 7d.

The following must be added. Mrs. Holt Thomas, £50; Mrs. Balfour (collected), £15 3s. 6d.; Mrs. Ruck Keene, £3; Mrs. Mocatta, £2 2s.; Mrs. Saunders, £1; Lady Flower, 10s.: Total, £71 15s. 6d.

A RAID SHELTER CORPS.

A large and representative meeting was held on Oct. 17th at the Jewish Board of Guardians, Middlesex Street, when it was resolved to form an Air Raid Shelter Corps, having for its object the provision of a body of volunteers who would endeavour to restore confidence during air raids by giving every possible assistance to women, children and the infirm.

Mr. Albert I. Belisha, who presided, said they had met to devise some means of assisting those who had little chance of protecting themselves during air raids. Though they had assembled at the Jewish Board of Guardians, he desired it to be clearly understood that they had not met in any sectarian spirit, but purely as Englishmen, with the view of restoring confidence and to be generally helpful by persuasion and good example. He was able to inform them that Major Lionel de Rothschild had expressed himself in warm sympathy with the movement, and he was grateful to Mr. Vincent Pitman for having inaugurated it.

[Excellent scheme! And the beauty of the idea is that the work of the corps will be done under cover. It should have no difficulty in recruiting.—Ed.]

REGULAR FORCES—Establishments.—R.F.C.—Mil. Wing.—Staff Officer, R.F.C., 2nd Cl.—(Graded for purposes of pay as a G.S.O., 2nd Grade, at the War Office.)—Capt. R. B. Bourdillon, M.C., Spec. Res., from a Flt. Comdr., Sept. 21st.

Flt. Comdr.—Lt. (temp. Maj.) The Hon. O. M. Guest, Yeo., T.F., to revert from a Sqdn. Comdr., to relinquish his temp. rank, and to be temp. Capt. whilst so empld., Oct. 1st, seniority Nov. 21st, 1915.

Asst. Instr. in Gunnery.—(Graded as an Equipment Officer, 3rd Cl.)—Lt. T. N. Weguelin, Hamps. R., T.F., and to be secd., Oct. 5th, 1917.

Adjts.—Capt. S. M. Pearce, Leic. R., T.F., Sept. 17th. Capt. F. W. I. V. Fraser, M.C., Seaf. Highrs., Oct. 3rd.

Park Comdr.—Sec. Lt. (temp. Capt.) E. Bush, W. Rid. R., from an Equipment Officer, 1st Cl., and to be temp. Maj. whilst so empld., Aug. 22nd.

School of Instruction.—Schools of Mil. Aeronautics.—Asst. Instr.—(Graded as an Equipment Officer, 2nd Cl.)—Temp. Sec. Lt. M. A. Millar, Gen. List, from an Equipment Officer, 3rd Cl., and to be temp. Lt. whilst so empld., Sept. 12th.

Gen. List.—Temp. Lt. (temp. Maj.) G. R. Moser, Arg. and Suth'd Highrs., to be temp. Lt.-Col. whilst Comdt. (graded as a Depôt Comdr.) of a School of Aerial Gunnery, April 1st. Flt. Serjt. R. Scoon, from R.F.C., to be temp. Sec. Lt., Sept. 30th.

SUPPLEMENTARY TO REGULAR CORPS.—R.F.C.—Mil. Wing.—Lt. (temp. Capt.) A. M. Low relinquishes his commn. on appt. to R.N.V.R., Oct. 2nd.

War Office, Oct. 20th.

REGULAR FORCES—Staff.—The following temp. appts. are made at the War Office:—Dir.—Capt. (temp. Lt.-Col) F. C. Jenkins, R.F.C., Spec. Res., from an Asst. Dir. and to be temp. Brig.-Gen. while so empld., Aug. 31st.

Dep. Dir.—Capt. (temp. Lt.-Col.) C. H. Whittington, R.F.C., Spec. Res., from an Asst. Dir., and to be temp. Col. while so empld., Aug. 31st.

Asst. Dir.—Temp. Capt. R. H. Austin-Sparks, Gen List, from a Dep. Asst. Dir., and to be temp. Lt.-Col. whilst so empld., vice Capt. (temp. Brig.-Gen.) F. C. Jenkins, R.F.C., Spec. Res., Aug. 31st.

Dep. Asst. Dirs.—Temp. Lt. (temp. Capt.) R. W. Roylance, Gen. List, from a Staff Capt., and to retain his temp. rank whilst so empld.; temp. Capt. W. H. Ewen, Gen. List, from a Staff Capt., vice temp. Capt. (temp. Lt.-Col) R. H. Austin-Sparks, Gen. List; temp. Capt. K. G. S. Hatfield, Gen. List, from a Dep. Asst. Dir. (graded as a Staff Capt), Aug. 31st.

ESTABLISHMENTS.—R.F.C.—Mil. Wing.—Flt. Cmdrs.—Lt. I. A. J. Duff, Dorset R., T.F., from a Flying Offr., and to be temp. Capt. whilst so empld., Sept. 12th. (Substituted for notification in "Gazette" of Sept. 20th.) From Flying Officers, and to be temp. Capts. whils tso empld.:—Sec. Lt. (temp. Lt.) M. Thomas, Welsh R., T.F., July 29th. Lt. G. E. W. Hitchcock, R.E., Spec. Res., and Sec. Lt. C. F. Davies, R. Highrs, T.F., Oct. 5th.

Gen. List.—Serjt. W. H. Goodbrand, from R.F.C., to be temp. Sec. Lt., Sept. 12th.

TERRITORIAL FORCE.—Glouc. R.—Capt. H. C. E Cherry is now secd. for duty with the R.F.C., July 27th.

War Office, Oct. 22nd.

REGULAR FORCES—Establishments.—R.F.C.—Mil. Wing.—Special Appt.—(Graded as a Park Comdr.).—Temp. Lt. L. Legge, Gen. List, from a Special Appt. (graded as an Equipment Officer, 2nd Cl.), and to be temp. Maj. whilst so empld., Oct. 8th.

Gen. List.—Actg. Sjt.-Maj. S. T. Kemp to be Sec. Lt., Aug. 28th.

TERRITORIAL FORCE.—Royal Horse and Royal Field Artillery.—To be Lts., prec. June 1st, 1916:—Sec. Lt. (temp. Capt., R.F.C.) F. N. D. Masters, sen. next below Lt. F. Ellerton, to retain temp. rank of Capt., R.F.C., and to remain secd.

* * *

The King has been pleased to award the Distinguished Conduct Medal to the following non-commissioned officers, and men. The acts of gallantry for which the decorations have been conferred will be published in the "London Gazette" next month if practicable:—

77690 1st Cl. Air Mech. A. W. Cant, R.F.C. (Uppingham).
4965 1st Cl. Air Mech. S. Hall, R.F.C. (Newton Heath, Manchester).
3116 Sjt. W. E. Smith, R.F.C. (Barnes Park, London).
48027 Pnr. W. T. Smith, R.E., attd. R.F.C. (Kensal Rise, London).
4400 Sjt. R. C. Taylor, R.F.C. (Willesden).

FROM THE COURT CIRCULAR.

Buckingham Palace, Oct. 19th.

The following officers then had the honour of being received by the King, when His Majesty invested them with the Insignia of Companions of the Orders into which they have been admitted:—

Bar to the Distinguished Service Order.

Wing Comdr. Arthur Bigsworth, R.N.

The Distinguished Service Order and the Distinguished Service Cross.

Flt. Lt. Basil Hobbs, R.N.A.S.

The Distinguished Service Order.

Flt. Comdr. Christopher Galpin, R.N.A.S.
Flt. Lt. Harwood Arnold, R.N.A.S.
Lt.-Col. Philip Joubert de la Ferté, R.A. and R.F.C.

* * *

The King then conferred decorations as follows:—

The Distinguished Service Cross and Bar.

Flt. Sub-Lt. Robert Dickey, R.N.A.S.

The Distinguished Service Cross.

Flt. Comdr. Clarence Maclurin, R.N.A.S.
Observer Lt. Russell Gow, R.N.A.S.
Observer Lt. Eric Betts, R.N.A.S.
Flt. Lt. George Simpson, R.N.A.S.
Flt. Lt. Robert Leckie, R.N.A.S.
Flt. Sub-Lt. Lacey Glaisby, R.N.A.S.
Flt. Sub-Lt. Arthur Simms, R.N.A.S.
Warrant Officer, 2nd Grade, Frank Whitmore, R.N.A.S.

The Military Cross.

Capt. Noel Barraclough, R.F.C.
Capt. Charles Holland, R.F.C.
Sec. Lt. James Mansfield, R.I. Fus., attd. R.F.C.

Buckingham Palace, Oct. 20th.

The following had the honour of being received by the King, when His Majesty invested them with the Insignia of Companions of the Orders into which they have been admitted:—

The Distinguished Service Order and Bar.

Flt. Comdr. Robert Little, R.N.A.S.

The Distinguished Service Cross.

Flt. Comdr. John Brooke, R.N.A.S.
Flt. Comdr. Herbert Travers, R.N.A.S.
Flt. Lt. Walter Williams, R.N.A.S.
Observer Lt. James Kerry, R.N.A.S.

The Military Cross and Bar.

Capt. Anthony Wall, Middlesex Regt. and R.F.C.

The Military Cross.

Capt. Rupert Atkinson, R.F.C.
Capt. Roderick Keller, Royal Warwickshire Regt. and R.F.C.
Capt. Kenneth McCallum, Argyll and Sutherland Highlanders and R.F.C.
Capt. Henry Rushforth, Gen. List and R.F.C.
Lt. Robert Hamilton, Highland Cyclist Battalion and R.F.C.
Lt. Lionel Baker-Jones, Welsh Regt. and R.F.C.
Lt. Richard Jones, Gen. List and R.F.C.
Lt. Esmond O'Hanlon, Gen. List and R.F.C.
Lt. Thomas Pearson, R.F.A. and R.F.C.
Sec. Lt. William Cook, New Zealand Forces and R.F.C.
Serjt.-Maj. Charles Kernot, R.F.C.

NAVAL.

The following appointments have been made in the Royal Naval Air Service:—

Oct. 19th.—Flt. Comdr. C. W. H. Pulford promoted to actg. sqdn. comdr., with seny. Oct. 17th.

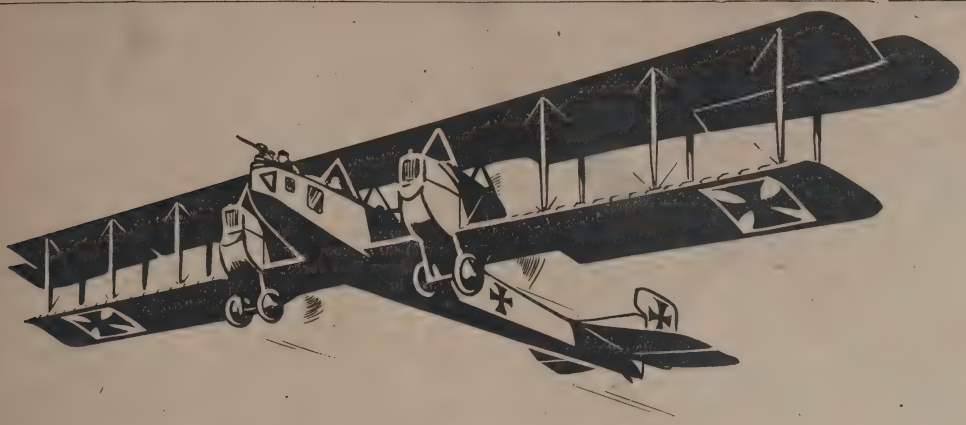
Chief P.O. H. Leedham granted a temp. commission as lieut., R.N.V.R., with seny. Oct. 18th.

Oct. 20th.—Mr. B. G. McCormick granted a temp. commission as Lieut., R.N.V.R., to date October 19th.

Admiralty Communiqués.

Oct. 16th.—A considerable number of patrols were carried out yesterday by naval aircraft, in the course of which several enemy aeroplane formations were encountered. Two of the enemy machines were driven down. One of our machines is missing.

During the 24 hours bombing raids were carried out on the following objectives:—Bruges docks, Varssenaere aerodrome and Houttave aerodrome (the last two respectively north-west and south-west of Bruges).



Large quantities of explosives were dropped with good effect, all our machines returning safely.

Oct. 17th.—On the night of Oct. 15th-16th a bombing raid was carried out by naval aircraft on Bruges Dock, on which objective many tons of bombs were dropped.

During Oct. 16th one of our fighter patrols brought down a two-seated enemy machine in the vinicity of Zarren. The observer was seen to fall out, and the machine turned over and fell, on fire.

All our machines returned safely.

Oct. 18th.—During the day (Oct. 17th) patrols were carried out by the Royal Naval Air Service, several enemy formations being encountered. One enemy seaplane was brought down and

WARNING!
TAKE COVER!

Against running short of aircraft supplies. You should provide for future requirements by ordering at once.

We can deliver large quantities of various items from stock, and it will pay you always to use "ASCOL" GENERAL SERVICE.

The whole of our organisation is at your disposal, and if occasionally we ourselves are unable at the moment to deliver a particular item from our own stocks, we will be pleased to help you get it elsewhere.

When in town you should make a point of visiting our new Warehouse and Showrooms in Long Acre. The facilities we now have for immediate delivery of all types of parts will interest you. We can quote you for early deliveries of Special Aircraft and Engine Parts from our own works!

Our Illustrated Stock and Quotation List in "Aircraft Supplies" (Our Fortnightly House Journal), ready to-day, will help you to keep your stores

ALL CLEAR!

of trouble and delays. Copies will be sent regularly on application.

seen to crash, while two other enemy machines were probably destroyed.

*Oct. 19th.—On the morning of the 18th inst. a bombing raid was carried out by naval aircraft on Varssenaere aerodrome (south-west of Bruges). Many bombs were dropped with satisfactory results.

All our machines returned safely.

Oct. 21st.—On the night of October 19th and during the morning of the 20th, bombing raids by naval aircraft were carried out on the following military objectives:—Bruges Dock, Engel aerodrome (north-west of Thourout). A fire is reported to have broken out at the latter place.

Large quantities of explosives were dropped.

All machines returned safely.

Oct. 22nd.—At about noon on October 21st, raids were carried out by naval aircraft on Vlisseghem aerodrome and on Houttave aerodrome (respectively north-east and east of Ostend). The bombs appeared to burst accurately.

Both during the raids and on the return our bombing machines were attacked by enemy aircraft, two of which were shot down completely out of control. Our bombers all returned safely.

During offensive and reconnaissance patrols five of our scouts engaged about 20 hostile scouts, two of the latter being destroyed and two driven down completely out of control.

One of our pilots is missing.

The Casualty List.

Reported Oct. 19th.

Missing.—Oakley, Flt. Sub-Lt. W. E. B., R.N.

Wounded.—Binks, Flt. Sub-Lt. A. J., R.N.

Sutherland, Flt. Sub-Lt. I. F., R.N.

Accidentally Injured.—Towers, Flt. Sub-Lt. G., R.N.

Campbell-Orde, Flt. Sub-Lt. A. C., R.N.

Previously reported Missing, now reported Prisoner of War.—McMillan, Flt. Sub-Lt. R. E., R.N.

Reported Oct. 22nd.

Accidentally Injured.—Waistell, Flt. Lt. A. M., R.N.

Previously reported Missing, now reported Killed.—Haines, Obs. Sub-Lt. C. L., R.N.

Previously reported Missing, now presumed Killed.—Hodges, Flt. Sub-Lt. C. R. W., R.N.

PERSONAL NOTICES.

Death.

BARON.—Flt. Sub-Lt. Maurice Nelson Baron, R.N., who was previously reported missing, and is now reported killed in action on August 15th, was the eldest son of Canon and Mrs. Baron, Alford Vicarage, Lincs. He was 18 years of age.

Engagements.

GOLDING—PEACOCK.—An engagement is announced between Flt. Lt. M. J. Golding, R.N.A.S., youngest son of Mr. and Mrs. Golding, Kneller, Feltham, Middlesex, and Jeannee Peacock, third daughter of Mr. and Mrs. Peacock, Pellisson House, Redcar.

MEADE—RICCARDI-CUBITT.—A marriage has been arranged, and will shortly take place between Flt. Lt. William Abbott Meade, R.N., only son of Mr. and Mrs. Meade, of Woodbury, Surrey, and Vera, eldest daughter of Lieut. Count and Countess Riccardi-Cubitt, of Eden Hall, Edenbridge, Kent.

SHOVE—BARKER.—An engagement is announced between Staff Paymaster Cyril A. Shove, R.N., secretary to the Director of Air Services, son of the late Arthur W. Shove, Lee, London, and Blanche Delmege, daughter of the late Col. Arthur Barker, A.M.S., 144, Harley Street, and Mrs. Arthur Barker, Clive Lodge, Albury, Surrey.

Marriages.

BUMPUS—RANKEN.—On October 19th, at Putney Presbyterian Church, Upper Richmond Road, Putney, Lt. F. A. Bumpus, R.N.V.R. (attd. R.N.A.S.), third son of Mr. and Mrs. A. A. Bumpus, of Park Road, Loughborough was married to Mary, daughter of Mr. John Ranken, of Lytton Grove, Putney, by the Rev. John Cochrane.

COTTON—MACLEAN.—On Oct. 16th, in London, Frederic Sidney Cotton, ex-Flt. Lt., R.N., eldest son of Mr. and Mrs. A. J. Cotton, of Grandchester, Queensland, was married to Joan Movaren Maclean, only daughter of Alick and Josey Maclean, granddaughter of the late Charles Donald Maclean, Indian Civil Service, and William J. Dickson, Minister H.M. Diplomatic Service.

HAVERS—DANIELS.—On the 16th, at St. Bartholomew's Church, Sydenham, Flt. Lt. John W. Havers, R.N., eldest son of the late W. J. Havers, barrister-at-law, and Mrs. Havers, of Thelton, Arundel, was married to Winifred Rosabel, eldest daughter of Mr. and Mrs. Daniels, of Wykeham, Sydenham, by the Rev. Mr. Boyne-Bunting, assisted by the Rev. P. T. Andrews, of Lyminster, Sussex.

Birth.

PEGG.—On October 19th, at Beechwood, Dundee, Lorna (née Cox), the wife of Sub-Lt. John Pegg, R.N.V.R., attd. R.N.A.S., of a son.

Details of a series of adventures which befell Flt. Comdr. Edwin Roland Moon, D.S.O., R.N., of Southampton, who was at first reported killed in East Africa, but who is now a prisoner in the hands of the Germans, and Comdr. the Hon. Richard Bridgeman, D.S.O., R.N., who lost his life, have been received:—

It appears from the story of a captured German merchant captain and from native sources that a seaplane carrying the two officers was forced to land in the delta of the Rufigi River owing to engine trouble. As they could not repair the damage the officers burnt their machine. Flt. Comdr. Moon swam across a stream which swarmed with crocodiles with a view to finding a boat or canoe, but failed in his quest. On the following day he again crossed the river, but was carried down stream by the ebb tide before he could land, and had to force his way back through the mangroves.

Apart from cocoanuts the officers had had nothing to eat or drink since leaving their station. At nightfall, after much weary marching, they discovered an empty house, and were able to make a raft on which they set off. Their only relief from mosquitos was to dip their heads under the water. The cocoanut milk which they carried in bottles had turned sour by this time, and by the evening of the third day both were completely exhausted. Comdr Bridgeman, indeed, was almost insensible.

The tide carried the raft out to sea and the raft became waterlogged, so that Flt. Comdr. Moon had to support his comrade in his arms in order to keep the almost unconscious man's head out of the water. The two spent 13 hours on the raft on the fourth day, and for at least nine hours were on the open sea. Again and again Comdr. Bridgeman was washed off the raft and rescued again by his brother-officer, until at last he died of exhaustion and exposure.

During the afternoon of the fourth day the tide carried the raft back to within a short distance of the shore, and the survivor managed to regain the land. In his final struggle to shore, his face, hands, and feet were severely cut by the rocks. A native conducted him to two Germans who were living near, and there he collapsed. He soon recovered, however, and is now quite well.

Comdr. Bridgeman's body was washed ashore a few days afterwards and was buried by the Germans.

* * *

The following descriptions of further incidents in the campaign being waged against enemy submarines taken from official records have been issued for publication:—

One of the coastal airships, of a type familiar to visitors at seaside resorts, was recently on patrol, and sighted a steamer in distress. On descending closer to investigate, it was found that she had been torpedoed by an enemy submarine, but was capable of being towed into harbour. The airship summoned assistance by wireless, and until it arrived hovered protectingly round the crippled merchantman. No signs of her late assailant were visible, and in due course the steamer was taken in tow by tugs and headed for harbour. The aerial escort accompanied the tow, and about an hour later sighted the conning tower of a submarine about five miles to the south-eastward of the convoy, apparently manœuvring for another shot.

The airship instantly signalled by wireless the position of the submarine to all men-of war in the vicinity, and swooped down to attack. The submarine saw her coming, and dived, but too late. Two bombs were dropped simultaneously in front of the swirl of his descent; a violent explosion ensued, followed by oil and air-bubbles in ominous quantities. Shortly after a destroyer arrived and investigated with sweeps. The airship, returning to her base for a further supply of bombs and petrol, was overtaken by the aerial signal: "You've undoubtedly bagged him."

On a subsequent occasion this same airship, while flying in company with a west-bound convoy of merchantmen, sighted the track of a torpedo, and a moment later observed a great column of water shoot up alongside one of the steamers. A submarine, relying on the state of the sea for concealment, had with great daring dived beneath the armed escort and torpedoed her victim under their noses. The weather at the time was bad, and rapidly getting worse; the airship shot down and along the track of the torpedo at a speed of 90 miles an hour, and at the end of the track sighted the outline of a submerged submarine, which, her deadly work done, was leisurely proceeding westward. The airship turned and released her bombs while she hovered above, and the explosion was followed by a great upheaval of air and air-bubbles. A calcium flare was dropped to mark the spot, and armed patrol vessels, summoned by signal, made assurance doubly sure with explosive charges. The airship returned to her base in the teeth of a head gale, and landed with the wind blowing 45 miles per hour.

MILITARY.

G.H.Q. Communiqués.

Oct. 16th, 9.15 p.m.—During the morning of the 15th inst. much successful artillery work was accomplished by our aeroplanes. Many photographs were taken and the enemy's infantry were harassed with machine-gun fire from low altitudes.

In the course of the day two tons of bombs were dropped by us on a large German ammunition dump near Courtrai and on hostile billets and hutments in the battle area. A number of bombs were dropped by night also on various targets in the enemy's forward areas.

In air fighting three German machines were brought down and two driven down out of control.

Three of our machines are missing.

Oct. 17th, 10.15 p.m.—British aeroplanes carried out a very successful bombing raid this afternoon into German territory.

A factory west of Saarbrücken, some 40 miles beyond the German frontier, was attacked. Many bombs were dropped with good effect, and fires were seen to break out in the factory.

All of our machines returned safely.

On the 16th instant our aeroplanes took advantage of the fine period from dawn till 3 p.m. to carry out artillery work and photography. A large number of bombs, also, were dropped during the day on hostile billets, hutments, and trenches.

Two German machines were brought down in air fighting, and one other was shot down by our anti-aircraft guns.

One of our machines is missing.

Oct. 18th, 9.8 p.m.—On the 17th inst. fine weather produced great aerial activity. Visibility was excellent, and enabled our machines to do a great deal of successful artillery work and photography.

Ninety-eight bombs were dropped by our aeroplanes during the day on the enemy's billets and hutments.

The strong west wind and clear atmosphere were ideal for the enemy's artillery reconnaissance and fighting machines, which were active and very aggressive in the forenoon.

Several flights were made at high altitudes over our lines, with the result that of the enemy machines brought down by our aeroplanes, three fell in our territory.

In all, 11 German machines were brought down by us, including one shot down by anti-aircraft gun fire, and four others were driven down out of control.

Three of our machines are missing.

Oct. 19th, 9.10 p.m.—Reconnaissances, artillery work, and photography were carried out by our aeroplanes, and in the course of the day two and a half tons of bombs were dropped on a large gun position near Douai, on railway sidings near Ghent, and on various hostile billets and hutments.

At night a further ton of bombs were dropped by us on Courtrai Station and on the German aerodrome in that vicinity.

In air fighting six hostile machines were brought down and four were driven down out of control. Another German machine was shot down by anti-aircraft gun fire.

Seven of our machines are missing.

Oct. 20th, 9.2 p.m.—On the 19th inst. dense mist almost entirely prevented aerial work. A little artillery work was carried out by our aeroplanes, and 50 bombs were dropped by us on various targets.

There was very little improvement in the weather during the night, but a few bombs were dropped on a hostile railway station.

No fighting took place during the day.

Oct. 21st, 9.17 p.m.—In spite of very misty weather a further attack into Germany was carried out by our aeroplanes this afternoon.

A foundry and railway junction ten miles north-west of Saarbrücken were bombed, over a ton of bombs being dropped.

Very good results were observed, and bursts were seen on the foundry and railway station. A big explosion took place.

Many hostile scouts attacked the bombing squadrons over the objective, and four were driven down out of control. Photographs were taken by us.

All our machines returned except one.

On the 20th inst. the weather was very fine, but a thick haze prevented observation for artillery by our aeroplanes.

During the day bombing operations were carried out by us vigorously, and a total of 238 bombs were dropped on the enemy's aerodromes at Gontrode and Roulers, on Cortemarck station, and on hostile billets and hutments.

One of the aerodromes at Roulers was bombed from a low height, and one bomb was seen to hit and blow to pieces a German machine on the ground, while another fell through the centre of a hangar.

The enemy's personnel and machines on the ground were then attacked with machine-gun fire from our aeroplanes.

During this bombing attack our scouts operating in the neighbourhood brought down seven German machines, which crashed in full view of their aerodrome.

At night the enemy's aerodromes were again attacked, and a ton of bombs were dropped on Ingelmünster aerodrome and railway station, and on the aerodromes at Courtrai. At one of these a direct hit was obtained upon a hostile machine which was endeavouring to leave the ground.

In the course of the day a total of nine German machines were brought down, and four were driven down out of control.

Three of our machines are missing.

Oct. 22nd, 9.34 p.m.—On the 21st instant the fine weather continued, and the improvement in visibility enabled a great deal of artillery observation work and photography to be done.

During the day a total of four tons of bombs were dropped by our aeroplanes on aerodromes near Courtrai and Roulers, on a large gun position near Douai, on billets east of Lens, and on other targets in the battle area.

At night nearly three tons of bombs were dropped by us on Roulers and Lichtervelde railway stations, where fires were started, and on hostile aerodromes in the vicinity of Courtrai and Roulers.

One of our pilots arrived at a German aerodrome as the enemy's night bombing machines were getting off and dropped his bombs amongst them.

Heavy fighting took place in the air, chiefly well over the enemy's line.

Twelve hostile machines were brought down, and three others were driven down out of control. Another German machine was shot down by anti-aircraft gun-fire

Eight of our machines are missing, including one which has not returned from night bombing.

The Naval Squadrons attached to the Army have been fighting throughout these operations, and accounted for a large share of the hostile machines brought down.

The Australian Squadrons, who up to the present have been training, have now commenced active work, and have already proved themselves worthy of the high opinion that was formed of them on their arrival.

War Office Communiqués.

Oct. 17th.—The G.O.C. the British Forces in Mesopotamia reports :—

On October 16th our aeroplanes dropped bombs on a Turkish aerodrome at Kifri, 50 miles north of Shahroban (and on the Turkish lines of communication to the Bagdad region), doing much damage.

On the return journey one of our aeroplanes was forced to land and had to be burnt, but the occupants were brought in by other machines.

Oct. 18th.—The G.O.C. British Forces in Palestine reports :—There is no change in the situation on the Palestine front. Two hostile aeroplanes have been brought down in our lines recently.

Information has also been received that early in the month Arab forces successfully raided the railway communications to the north of Medina (the Hedjaz Railway).

Home Command Communiqués.

Oct. 19th, 12.0 p.m.—Hostile airships attacked the Eastern and North-Eastern Counties this evening.

The enemy aircraft proceeded some distance inland over these counties, but did not carry out any very definite attack.

Six or seven raiders took part in the raid.

Bombs have been dropped at various points, including a few in the London area.

The raid is still in progress.

Oct. 20th, 12.15 p.m.—The latest police reports show that in last night's airship raid the following casualties occurred in all districts visited by the raiders :—

Killed, 27. Injured, 53.

Some material damage was caused to house property and business premises.

The Casualty List.

Reported Oct. 17th.

Killed.—Knight, Sec. Lt. G. H., R.F.C.
MacKay, Capt. J. I., D. of Well. R., attd. R.F.C.
Steward, Sec. Lt. A. A., R.F.A., attd. R.F.C.

Died of Wounds.—Armitage, Sec. Lt. E., R.F.C.

Wounded.—Johnston, Sec. Lt. J. E., Cyc. Bn., attd. R.F.C.

Missing.—Ainger, Lt. H. C., R. Scots, attd. R.F.C.
Fitzgerald, Sec. Lt. J. J., R.F.C.
Jeffs, Lt. C. H., Bord. R., attd. R.F.C.
Stevenson, Sec. Lt. J. G., R.F.C.
Walrond-Skinner, Capt. D. D., Mon. R., attd. R.F.C.

Reported Oct. 18th.

Killed.—Holt, Lt. H. G., M.C., R.F.C.
Lewis, Sec. Lt. E. P., R.F.C.

Previously reported Missing, now reported Killed.—
Gayner, Sec. Lt. W. J., Som. L.I., attd. R.F.C.
Honer, Lt. D. J., R.F.A., attd. R.F.C.

AERONAUTICAL ENGINEERING

SUPPLEMENT TO "THE AEROPLANE"

INCORPORATING AIRCRAFT ENGINEERING, AERODYNAMICS, AND MATTERS PERTAINING TO THE AERONAUTICAL ENGINEER AND THE AIRCRAFT TRADER

The British Aircraft Industry.

BY CHARLES L. FREESTON.

XXVII.—HEWLETT AND BLONDEAU.

Old-timers will not need to be reminded of the fact, but for the benefit of those whose interest in aviation is synchronous with the war it may be explained at once that the above-mentioned title is unique. The senior partner of Hewlett and Blondeau is a woman—Mrs. Maurice Hewlett to wit—and one who has long since proved her business capacity as well as other remarkable qualities.

A Proud Record.

For Mrs. Hewlett is not only the first woman constructor of aeroplanes, but also holds the proud record of being the first Englishwoman to gain a pilot's ticket. The coveted brevet was earned so far back as August 29th, 1911, and was numbered 122; even as an aviator, therefore, apart from sex, Mrs. Hewlett may fairly be included among the noble band of pioneers. She learned to fly at Brooklands on a Farman biplane, and her instructor was Mr. Gustave Blondeau, who had learned to fly at Mourmelon, and in June, 1910, was awarded the 101st certificate issued by the Aero Club de France.

The First Brooklands School.

In partnership, Mrs. Hewlett and Mr. Blondeau scored another "first," for in 1911 they founded the first school of flying to be seen at Brooklands. Pupils were forthcoming almost as soon as the opening of the school was announced, and among those who graduated there were such well-known pilots as Lieut. Spenser D. A. Grey, R.N., Captain T. G. Hetherington, Lieut. Snowden Smith, the late Lieut. Cecil Marks, the late Mr. J. L. Longstaffe, M. Maurice Ducrocq, Mr. C. R. Abbott, and Mr. R. Graham Wood.

Mrs. Maurice Hewlett.

Mr. Blondeau's Career.

Mr. Blondeau himself is an engineer of sound and varied training. Born at Tergnier, near St. Quentin, in 1871, he gained his first mechanical experiences in the shops of the French Northern Railway Co., to which his father was works manager. At the company's technical school the son scored the premier place in the examinations, and after passing out he entered a sugar mill and gas-engine plant manufactory as draughtsman, and remained there until, at the age of 21, he was claimed for military service. After his two years' training with the Army he returned for another year to the gas-engine factory, and then became chief draughtsman to a big tramway building firm, and after three years was appointed chief erector, and travelled in that capacity through France, Belgium and Spain.

The Two-stroke Motor

Becoming interested, however, in the petrol-driven engine as applied to motor-cars, he joined a firm of automobile constructors as draughtsman, to gain experience, and was eventually taken into partnership. He made a special study of the two-stroke motor, which at that time was regarded as adaptable to the dirigible balloon, and was being put through experiments by Colonel Renard, at the French Physical Laboratory at Meudon. While on this work Mr. Blondeau entered one of his cars in the Paris-Madrid race of 1903, and himself drove in the Circuit des Ardennes race of the same year.

The First Machine.

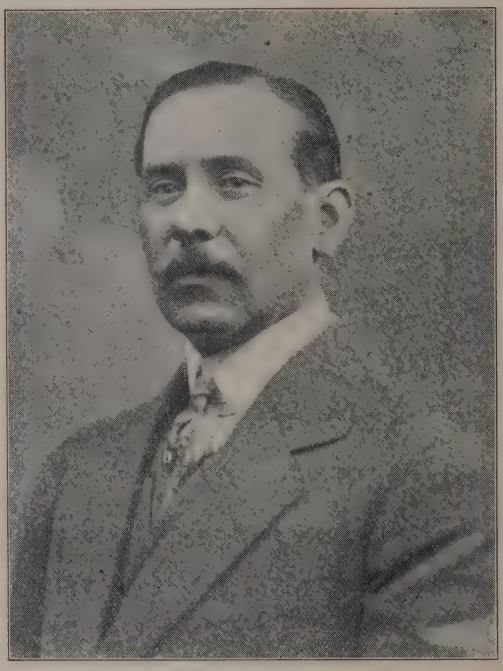
It was during the Blackpool Aviation meeting of 1909 that Mr. Blondeau interested Mrs. Hewlett in aerial developments, and together they formed a plan to obtain a machine and learn to fly. Mr. Blondeau went to Paris in the following December, and after investigations placed an order for a Henry Farman machine. In January he went to Mourmelon to study at the Farman works, and also secured a special permit for the same object in respect of the Gnôme engine works near Paris.

After he had learned to fly, however, as above stated, he had to wait until the following May for the delivery of his machine owing to the fact that a hurricane wrecked several of the Mourmelon hangars and destroyed a number of machines in various stages of construction. In the early days, as has already been seen in previous articles in this series, our pioneers had not only to experience vicissitudes in the air, but found the wind a potent enemy on the ground itself.

Mrs. Hewlett as Sportswoman.

Of Mrs. Hewlett's earlier career, it may be said that she is the daughter of the late Rev. George W. Herbert, vicar of St. Paul's, Vauxhall, and lived at Cavendish House, Clapham Common, where she was born, until the time when she married the well-known author, Mr. Maurice Hewlett, who was then a barrister.

Always fond of sport, she hunted in Worcestershire and rode and drove horses a good deal until the motoring era. Then she joined Miss Muriel Hind in a Singer tri-car non-stop run from London to Edinburgh, and they also took part in a six-days' reliability trial, and went through to the finish at John o' Groats. In the following year Mrs. Hewlett took her son on a similar journey in a Lagonda tri-car, which broke down, however, on the third day. Subsequently Mrs. Hewlett drove a 7-h.p. Panhard, and then a de Diétrich car, which is still preserved.



A Long Partnership.

When she became badly smitten with the desire to take up flying, her friends did their utmost to dissuade her from the project, and Mr. Hewlett even offered her a new motor-car as an alternative. She sold all her personal effects instead, however, and entered into a business partnership with Mr. Blondeau, which has been uninterruptedly successful in every respect.

At the first Brooklands flying meeting Mr. Blondeau was the only aviator to carry off a prize. Later on he built, under licence, a Farman racer, and this machine, piloted by Lieut. (now Colonel) Snowden-Smith, won the Brooklands to Brighton race for biplanes.

Learning under Difficulties.

Eventually Mrs. Hewlett aspired to pilot a machine with her own hands, but the process of learning was somewhat slow, not by reason of any deficiency on her own part, for she has good hands and a keen mechanical sense, but for the simple reason that machines were as rare so precious in those days, and had to be handled with extreme care lest a crash should leave the Brooklands school without the means of carrying on. Consequently she could only obtain lessons at odd moments, when the pupils themselves were not requiring the solitary Farman; but of such opportunities as were available at long intervals she made the best of uses, and qualified in due course.

M. Gustave Blondeau.

Another Record.

Then Mrs. Hewlett established another record—perhaps the most noteworthy of all. She taught her son to fly. She modestly disclaims the sole responsibility for this achievement, and states that Mr. Blondeau did the major portion of the tuition, but the fact undoubtedly remains that Mrs. Hewlett did take a part, and the spectacle of a mother initiating her son into the art of flying, and at a time when the number of men themselves who had qualified as pilots was extremely limited, is one of the most striking in the history of any movement.

As one result of this remarkable combination, Mr. Hewlett, junr., was one of the first pilots to leave England for the seat of war. He had already joined the R.N.A.S., and has since seen a good deal of active service, including the Cuxhaven raid, after which memorable episode he was missing for a week. His many exploits and long experience, in fact, have earned him the rank of Squadron Commander.

The First Works.

The Brooklands school was carried on for 2½ years. After building a Maurice Farman in the hangars Mr. Blondeau obtained an order for building Hanriots, and secured workshops in consequence at Clapham Junction. It is only bare justice to say that even in these early days the firm of Hewlett and Blondeau secured a reputation for high-class workmanship and have maintained it throughout.

After 2½ years at Clapham Junction, during which various types of machines had been built, the works proved too small, and could not be extended, but as Government orders were in hand, it became necessary to migrate to more suitable ground.

A Search for a Site.

The search for a site proved by no means easy, but was not without amusing incidents. One day the firm received a telegram asking them to meet an unknown gentleman and the Duke of Orléans. At first the message was regarded as a mistake, and the telegram was about to be returned to the post office, but it was suddenly realised that it might refer to the negotiations already on foot concerning a Thames riverside site. The telegram was followed up accordingly, and the meeting took place. Then it came out that the business on hand did relate to the Thames site, but at the outset the firm was met by the proviso that no factory could be erected on the estate, while occupancy of the land also involved the maintenance of a road that ran right through it.

The Leagrave Factory.

At length an undeveloped area of land was discovered at Leagrave, a village which lies between Dunstable and Luton. The chosen site was a cornfield, when in May, 1914, the work of building a new aircraft factory was begun, but before very long aeroplanes were in course of construction and, as a matter of fact, several were completed before the war began.

Since then the works have been constantly undergoing enlargement, and building has never stopped. The Omnia factory as it is called, extends over some nine acres of ground, and there is unlimited room for expansion. Meanwhile constructive work has proceeded uninterruptedly on both Admiralty and War Office orders. The plant is in every respect up to date, and the firm makes its own metal parts and is not dependent upon any other concern.

A Ministry School.

An interesting and unique feature of the establishment is a Ministry of Munitions School, in which about sixty girls at one time are trained in mechanical work. When their tuition is complete they are given a practical trial in the shops themselves, and if found satisfactory are drafted to whatever works are in need of them.

The Leagrave factory is the only one in which girls are systematically trained as aeroplane mechanics in a place devoted to aeroplane construction alone, with a view to being transferred elsewhere, and the Ministry of Munitions has been very pleased with the results attained.

The "Aeromnia Magazine."

Mention should also be made of the fact that a monthly magazine is published in connection with the works, under the name of the "Aeromnia Magazine," and is quite the most ambitious thing of its kind that has so far been seen. The September issue contained an amusing article entitled "The Reflections of Kroshka," Kroshka being a big Dane who is regarded as an indispensable feature of the establishment. Originally he be-

longed to Major Gordon Bell in the early Brooklands days, but passed into Mrs. Hewlett's possession. He has visited every aerodrome and attended every big flying fixture and aero show, and his friends in the aircraft world are many.

Touring by Aeroplane.

As a pioneer pilot among women it might be supposed, perhaps, that Mrs. Hewlett was made of particularly stern stuff and had been addicted to hazardous feats. As a matter of fact, she tells me that she has never flown for anything but pure pleasure. At Brooklands she used a little machine with a 50-h.p. Gnôme, which was built for Lieut. Snowden Smith, whenever she had a chance of taking a trip on her own account.

Now she is looking forward to the time when, after the war, she may travel about on a small machine with a low-powered motor—she would not mind even a 35 h.p. Anzani—but with an enormous lift and folding wings, so that it could be put up anywhere, and be in no sense a source of worry. In other words, her ideal is to tour by aeroplane just as one would with an ordinary car. Big machines she regards as a war-time necessity, pure and simple, and believes that there will be a big demand for small craft after the war.

The Production of Aeroplanes and their Components

(Eighteenth Instalment.)

BY STEPNEY BLAKENEY.

Having installed the engine in position it is best to put an adjustable trestle underneath the nose of the fuselage in case the ropes which hold the tail end of the machine down give way. This incident has occurred before now, with disastrous results to the engine.

It will then be necessary to check the engine to see that it is in line with the line of flight, and, with the fuselage we have constructed. The line of flight will probably be that of the top longerons. It is from this line we must work, as it is our only base from which to start.

The engine which is being installed in this case is of a radial type and will, therefore, be fastened to the front and the back engine-plates, which are attached to the fuselage. Therefore, we must satisfy ourselves that the front engine-plate is truly at right-angles with the line of the top longerons. Also, the plate must be tested to make sure that it is transversely at right-angles with the centre line of the whole fuselage. Unless this is done, the engine and propeller will always have a tendency to look either to the left or the right, according to whichever side the engine-plate inclines.

The reason for this demand for accuracy is that the aeroplane is designed to fly normally in a dead straight line, and it will not do this if the engine is not fixed squarely and truly in the fuselage.

Petrol Connections.

The installation and the coupling up of the petrol and oil pipes must next be taken in hand. Before any pipe of any description is finally coupled up in its position, the pipe should be thoroughly tested, preferably under steam or air pressure, for strength and leaks, and also to make absolutely sure that there are no obstructions of any kind inside its whole length; this precaution is most necessary and cannot be too strongly impressed on all concerned; in fact, I consider that in view of the importance of this matter it should come under the inspection department.

The bending and the adjusting of pipes should only be done by workers who are skilled in this class of work, as dents and kinks of any kind should not be tolerated in the smallest degree, as it causes inefficiency in the whole system of piping. Also all spelter should be carefully cleaned off, all brazed joints and the pipes generally should be finished off in a high-class workmanlike manner. Any deviation from this standard is undesirable.

The revolution counter, and the shaft for driving it, will next be required to be fitted and coupled up.

During the time that the pipes were being tried and fitted into position, the cowling over the engine should have been in the hands of the coppersmiths and panel beaters, and can now be fitted on.

Fitting the Cowl.

The engine cowl is generally made of about 22-gauge aluminium sheet, and is either pressed out, spun or beaten to shape.

In measuring up for the quantity of metal sheet required to make a cowl, it is just as well to measure round the outside circumference of the cowl on a sectional elevation. It should be borne in mind that the metal has to be pressed or hammered to this shape without distorting or thinning, although, of course, this does take place in a small degree, but it is not desired to a measurable extent.

Before proceeding with the final fixing of the cowling and aluminium fairing generally, it will be as well to fix the centre plane struts into their sockets on the top longeron of the fuselage, attach the centre plane to same, and put the bracing wires into position. This work requires the taking of careful measurements, and the accurate adjustment of the fork-ends, so that an equal tension on each strut and bracing wire will be assured. Excessive tension is not required, as this only puts additional work onto the struts and fittings, and they are only designed for a certain load, which it is not desirable to exceed. When putting in the bracing wires, the insertion of the split-pins and bolts should be left over, in case any alteration has to be made in the tension or position of any bracing or fitting or bolt.

Assembling the Main Planes.

The assembling of the main planes can be done in two ways, namely, by attaching one, say, right-hand or left-hand top wing first, using a trestle to support it, and attaching the bottom wing on the same side afterwards, supporting this also on the trestle, until the interplane struts and lift wires are put in and adjusted to both wings.

The alternative method is to stand both wings on their leading edges and then put the interplane struts into their respective positions, together with the bracing wires, and tighten up the whole lot just sufficiently to hold them together. Then the wings can be carried by the erectors to the machine and attached as a whole with the aid of a couple of pairs of tall steps.

With reference to the above methods, there are advantages and disadvantages in them both, and it may be as well to give them consideration, to save waste of time and difficulty to those who have not had the experience of erecting wings on finished machines.

As regards the first method, it can be recommended for the use of erecting shops where there is a lack of skilled men used to handling aeroplane wings; secondly, it enables the erectors in the case of a new machine to set the wings up truly to the correct dihedral angle and angle of incidence at the same time, and to measure up the correct lengths for the bracing wires after the struts have been tried up and fitted to their permanent positions.

Wiring Lengths.

With regard to the last reason, of course, the mathematician will naturally come along and say that it is possible accurately to calculate the length of any side of a triangle, and that, as he is able to do this, the practical advantage which I have set forth is of no use, and need not be taken into account. I quite agree that his statements are perfectly correct, up to a point, and the point is, that the mathematical calculations do not tell one what effect the tightening of the bracing wires will have on the structure as a whole, or how much one bay will contract at the expense of another expanding, and because the mathematician has calculated to five places of decimals that a lift wire will be, say, 7.61500 ft. long, it most probably happens, when the machine comes into the hands of the skilled erector who is responsible for tuning up the machine for her test flight, that the required length of the lift wire will be found to be, say, 7.54 ft. long, the loss of 0.075 in. being due to the various struts bedding together under the strain and tension required in a machine tuned up for flight.

These remarks, therefore, emphasise the necessity for allowing an ample margin for adjustment in wires. Also, screw threads should not be too short, and under no circumstances should streamline wires, which are exceedingly difficult to get at the present time, be cut by irresponsible workers, without authority.

The disadvantages of erecting wings separately is that it entails more trouble in having to have high pairs of steps for the men to get up to the top wing to fix up the struts and attach the bracing wires, and it is sometimes awkward to drill split-pin holes when perched upon the top of a pair of steps about 10 ft. high. Also, there is the expense of the trestles.

With regard to the second system: this method works well in the hands of experienced erectors, either in the works or out in the hangar, when erecting a machine which has just arrived from the makers at the flying ground, as it saves time and trouble in having trestles and long pairs of steps and planks, and all split-pins can be fitted on the ground. The disadvantages are, that this method is only suitable for the erection of wings onto machines which have been previously assembled, as it does not enable accurate dimensions of bracing wires to be taken.

Quantity Production.

"Aerial Age," of New York, July 9th, publishes the following notes on production of aircraft in quantities. They should be of interest to the British Aircraft Industry :—

Quantity production is now the one important thing—the one thing over which there must be no loss of time, no confusion or squabbling. In fact, the situation is so serious that there must be no waste of time in considering unproven theories, details which fastidious theorists are apt to bring up, and there must positively be no waste of time in squabbling over matters of departmental jurisdiction or misunderstandings. There is no time for misunderstandings.

The Seven Most Important Factors in Quantity Production of Aircraft.

Coming down to details of producing aeroplanes in large quantities, there are some essentials which must be defined, else there will be confusion. The seven most important factors in producing aircraft in large quantities are as follows :—

(1) Placing Orders for Continuous Deliveries over a Period of Three Years.

To make it possible for manufacturers to develop their production facilities in proportion with the needs, the Government must place orders for aircraft extending over a period of three years, the types of machines to be built to be subject to change, but the orders not to be subject to cancellation, except in the event of the war ending, when the Government may cancel the orders, indemnifying the manufacturers for any losses involved. As the Government has it in its power to limit the profits and regulate the operation of factories, the Government will not be involved in losses in adopting a three years' programme of construction. In this way it can build an efficient and sufficient manufacturing machinery which will make it possible to turn out the thousands of aeroplanes needed to give the Allies the balance of power.

(2) Adoption of Standard Types of Machines and Motors.

Types that have already been proven successful should be adopted and produced without attempting any changes until better types have been developed in the experimental department.

To train the thousands of aviators in France, England, Canada, as well as in the United States, there will be needed thousands of machines of the "penguin" type, and tens of thousands of the advanced training type. The Allies have already agreed on the adoption of the Curtiss J-N type for advanced training, and will need tens of thousands of these. Then there are needed thousands of training machines for the training of naval aviators, and tens of thousands of the small combat type; of the large three-passenger armed machines now being used for photography, "spotting" artillery fire, reconnoitring, and other purposes; and of the very large bombing machines capable of making long distance raids. For the naval operations there will also be needed thousands of medium sized machines for aerial coast patrol work and for long distance bombing raids, as well as large torpedo-planes and seaplanes for long distance bombing raids.

(3) Experienced Aeronautic Engineers and Aeronautic Constructors.

Experience in aeroplane building is a most valuable factor, and every aeroplane plant that has manufactured aeroplanes, no matter how small the production, should be given orders large enough to permit expansion of manufacturing facilities to the fullest extent.

(4) Experienced Men in Quantity Production are Needed to Create Large Sources of Supply for Aircraft.

To avoid the failures experienced by large production firms, who have taken up the manufacturing of aeroplanes and motors in the past, arrangements should be made to combine the experienced aeronautic talent and the experienced production talent. Manufacturing facilities without aeronautic manufacturing experience will result in failure in efficiency, just as aeronautic engineering experience without quantity production experience will fail in production.

(5) Labour.

The American aeronautic industry to-day has more trained labour than the British aeronautic industry had in the beginning of 1914, and it should be possible to dilute this trained labour with untrained men and women to take care of the large aerial programme now under consideration. In aircraft manufacturing the employment of untrained labour not properly supervised by experienced men spells disaster, and means deaths of aviators.

(6) Materials and Supplies.

There may be an excuse for our not having dry lumber, aeroplane cloth, and other materials needed for aeroplanes at present, but there will be no excuse if we do not have it in six months from now. The seriousness of the situation forbids that we allow the important work of securing materials and supplies to be delayed, and it will avail nothing to the country or to the cause of the Allies to give excuses or justifications for not having the materials and supplies on hand when they are needed. For instance, there are hundreds of millions of feet of spruce available, but it has to be properly dried, and it would be too much to ask of lumber dealers to undertake to dry it and get it ready for aircraft manufacturing if the Government does not consider it necessary to take steps to give reasonable assurance to the dealers that the lumber will be used.

(7) Manufacturing Facilities.

Manufacturing facilities for aeroplanes are available to a tremendous extent, but not so much for the manufacturing of motors, metal parts, etc. Buildings and machinery are costly, and take some time to get. Manufacturers should be given assurance of orders immediately so that they may be able to get manufacturing facilities.

It is well to repeat that the one essential thing to ensure quantity production is the one thing which only the Government can supply, and which it never before did supply, and that is large orders for aircraft extending over a definite period, for the largest production possible, but without penalisation of manufacturers or red tape obstacles

The orders must extend over a definite period of time and every effort must be made to prevent the waste of manufacturing facilities such as there has been, due to the fact that new orders are seldom given until other orders have been completely filled. This practice of waiting until an order has been completed before giving another order forces a manufacturer into practical idleness for a period of time that has often extended to weeks, involving an irreparable loss of production to the country, and a serious financial loss to the manufacturer.

For instance, owing to lack of funds, the aeroplane manufacturers have been kept practically idle for the past two months, having no Government orders—although the entire country and

our Allies know that the number of aeroplanes which have been lost thereby may mean the difference between victory and defeat. This may not happen again. Every manufacturer who can turn out aeroplanes, no matter how limited his present resources, should be given orders to manufacture either the machine which he is producing, or the type adopted by the Army and Navy, the orders to be large enough to enable him to expand his facilities. This should be done with every manufacturer of aeroplanes, motors, dirigibles, balloons, propellers, and parts.

Penalising the manufacturers for failures on time deliveries must be abolished, as it has been abolished in Europe. Supposing a company that has been given an order for 10,000 aeroplanes delivers 90 per week instead of delivering 100. It certainly should not be penalised for that. Those in charge must realise that every manufacturer is as much part of the national machinery as the officers of Federal Departments themselves, and whereas profits are to be limited the Government must protect the manufacturer against losses. Unless this is done the manufacturers will find it necessary to curtail their expenses or quit business, either of which means loss of production to the Government.

As to profits, the American Government should follow the example of the British Government and give every opportunity to the aeroplane manufacturers who have been developing aeronautics at a deficit for so many years, to make up for their past losses.

[Don't British aircraft constructors wish they had such opportunities?—Ed.]

The British and French Governments very justly and wisely also give an opportunity to every small aeroplane manufacturer to develop his facilities. In many cases manufacturers who were barely capable of turning out one machine per week, were given orders for several hundred aeroplanes, to be built on Government specifications, and that enabled them to develop large factories in a minimum period of time.

In the training of aviators, the saving of time is also most important. Sufficiency is the first element of efficiency, and to get sufficiency in aviators means that the training schools must be kept going every minute between sunrise and sunset. There must positively be eliminated that waste of time due, for instance, to not having an extra shift of mechanics to get the machines in order after the day's flying is over, to have them ready for the following morning. Unless this is done, the best part of the day is lost in waiting for the repairing and tuning of aeroplanes which were used and put out of order the day before. As fair weather cannot be purchased, every minute of fair weather must be used for training—and reasonably bad weather can be used for advanced training, so that military pilots may be able to fly under war conditions.

Two things should be emphasised: (1) That for warfare there are being used more and more large machines; (2) That the exigencies of war require that everything be done to encourage invention. Therefore, a premium should be placed on developing more efficient machines, and nothing should be done that would stifle invention. This war is on such a tremendous scale that 20,000 machines of any one type can be used effectively even if a better machine should be developed in the meantime; but the actual control of the air may always depend on 20 per cent. of the machines employed being more efficient than the enemy's machines, whether they be large air cruisers carrying a number of gunners or small fighting machines carrying a single gunner. Invention should be encouraged so that the Allies may always have the most efficient aeroplanes with which to clear the sky of German aviators to permit the other 80 per cent. of the aeroplanes to operate unmolested, and the large torpedoplanes and bombing machines needed for major operations.

Vibrational Effects in Metals.

SOME MINUTE CHANGES.

Written and Illustrated by JAMES SCOTT.

It is somewhat difficult to trace the effects of vibration in ordinary circumstances, since they are then of a temporary character. Beyond a certain point, however, they become permanent, or progressive, and are then conspicuous, when properly examined through the microscope.

It is necessary to remember that all metals and alloys consist of various sized, yet collectively minute, recognisable particles, with a tendency to crystallise in a definite manner, according to their respective origins. They are held together by the force of cohesion, which may be mechanically or chemically disturbed to such an extent that it is largely superseded by that of adhesion. The two terms have, when broadly considered, a highly contrasting significance. In cohesion the molecules are bound together integrally by a power which resists outside influence up to a given degree; whereas in adhesion the separate items are simply stuck together by a joining medium. Cohesion is tested by the tensile stress beneath which it yields to the point of fracture. Adhesion resembles the uniting of two panes of glass pressed face to face. But the two forces really grade one into the other, and necessitate intricate testing to satisfactorily determine, except in prominent examples.

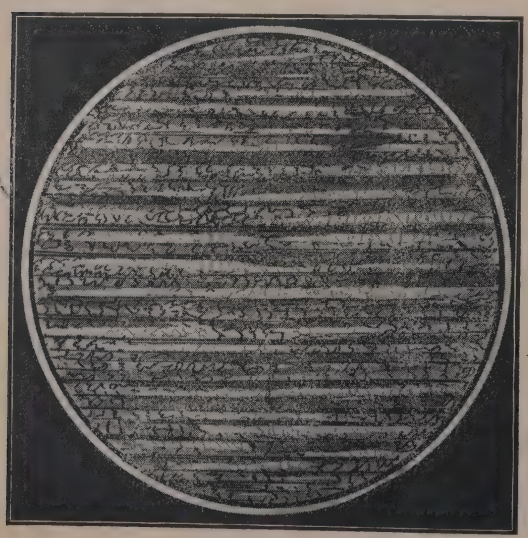

Fig. 1.—A space about 1/30 inch wide, magnified, showing parallel combinations of grains, due to vibration in ordinary steels.

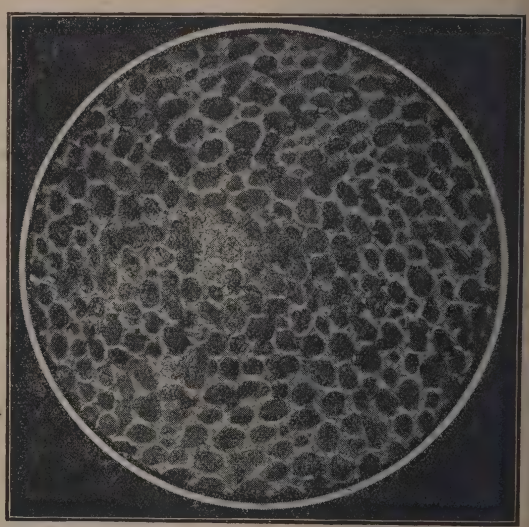

Fig. 2.—A space about 1/30 inch wide, magnified, showing a network of ferric-carbide, which becomes broken up by vibration. In hard steels this network sometimes oxidyses or rusts internally.

These matters concern the present subject, because vibration may cause the loss of cohesive strength and supplant the less desirable adhesive one for it. It is possible for the particles of a metal which are at first practically intact, and thoroughly complete, to suffer from shocks in such a way that they are separately reduced to a state in which they only adhere to one another. They would then be capable of easily falling apart, or snapping, after an amount of work which ought not to deleteriously affect them.

Welding, when efficiently done, gives rise to wholly cohesive properties; but if it is of an inferior nature the opposing surfaces are merely held together by a weak matrix, after the manner of

glue on wood, and thereby consists really of adhesively joined portions.

Metals possess a small amount of elasticity, which enables them to recover their normal conditions after strains if these are kept within limits. Suppose that we rapidly shake a sheet of metal while it is held upright by one corner or end. It is then vibrated into a successive series of waves or bends which must temporarily modify some of the particles; but when the metal is allowed to rest it is found to be as perfect as before, sectional and chemical investigations failing to disclose any striking changes. But, in the event of the action being sufficiently severe, a part is twisted so much that it retains the malformed shape, the particles concerned in the affected area being consequently entirely altered, and these will not resume their previous cohesive properties. This fact can be well demonstrated and observed in a piece of sheet tin, the crystals of which become very bold and loose along the convex lines of a curve or distortion. The oftener such treatment occurs, the worse it becomes.

Constant vibration gradually produces comparatively coarse crystals, which may meantime split parallel with their geometrical planes or sides, or along the positions conforming to them. The minuter ones combine, as it were, into larger kinds, but as there is no corresponding homogeneity they become individually flaky, with increase of dimensions, so that the binding power is reduced.

Some particles of a softer composition than others may congregate together into what are called flow-lines. Soft particles may also get scattered in a network of harder consistency, the one helping the other. The hard one is kept from snapping by the presence among it of the soft constituent; while the latter cannot fall out as it is held inside the hard cellular mass. In this case the contents are so well balanced that vibration shakes the hard particles together into a skeleton network or framework, which is prevented from becoming too brittle because of intervening pad-like soft contents. But *excess* vibration splits up the network and spoils it.

Metals behave differently in regard to vibration according to their form. Flat, wide metals do not respond in the same way as is noticeable in connection with bulky varieties.

In many cases, during vibration, particles slide or roll over one another, without the external formation of the whole mass being visibly altered. At the same time, the very slight modifications induced *have* been measured by means of delicate instruments. The pressure of the atmosphere, and so on, on all surfaces of the metal makes these actions resemble the movements of sand grains tightly packed in a box which is repeatedly turned about on itself or knocked. This is, of course, only a likeness, since these grains are loose, but my meaning will be clear, I hope. The cohesive force of a solid metal does not permit so easy a shifting of the particles, but alterations in position do happen, especially when strains are increased or continued incessantly. The particles go round and between one another, but do not leave the mass.

These changes eventually impart a striped structure to the metal, in the direction of its length. The tinier particles fall into grooves occasioned between the larger ones, and there is thus set up an alternating series of proportionately thin and thick areas, known as slip bands, which appear as dark and light lines when they are magnified.

A weakened condition of a metal may appear after too rapid cooling from the molten form, and not reveal itself until continued vibration has been experienced. In this way unstable phases which would be harmless and unalterable if the metal was employed for strictly suitable purposes become more and more paramount until breakage occurs. Chilling is adopted to prevent this modification. It gives a solid skin to the substance and permits the internal portions to cool at a slower and fairly uniform rate. Very tiny crystals, the collective strength of which

Fig. 3.—A space about 1/30 inch wide, magnified, showing slip-bands, due to vibration, in wrought iron and kindred metals.

is admirable, are resolved. But the process must not be overdone, or it may set up other faults. Proper annealing, too, nullifies any tendency in a wrong direction by fusing the little crystals compactly together.

Wrought iron is fibrous, although the particles are originally granular. The hammering to which the metal is subjected may be compared with vibration of so fierce a kind that the particles do not have time to recover their shapes. Now, it is a curious fact that wrought iron becomes granular again during true subsequent mechanical vibration, but it can be again resolved into the fibrous state by treatment.

It seems that the granular and fibrous textures of metals and alloys can succeed one another continuously in many instances, but not in all. Particles may unite end to end, forming striped layers, and these may, or may not, be capable of becoming resolved into the granular state. When a limit is reached in certain metals, cohesive power is lost, some of the particles fall asunder, and then a little unusual strain results in completely dividing them, and an irremediable fracture follows. Some metals and alloys reveal these formations when cut into sections without preparation; whereas others need to be etched with some suitable chemical re-agent.

The aim of the metal manufacturer is to provide reliable substances suitable for specific purposes, but defects unfortunately arise while shaping into various objects is being undertaken. But the most excellent article may be spoilt by agencies, including atmospherical fumes, which are quite beyond our control; and vibration then discloses damage which would otherwise have remained unseen.

In No. 1 the grains have been shaken into ridges, parallel with one another, thereby weakening the metal. In No. 2 the network (first helping to strengthen it) has become snapped and inferior. In No. 3 consolidated stripes have settled into dense bands capable of fracturing smaller, and ruining the metal.

A PLEA FOR PATIENCE.

Owing to the great public interest taken in the new geared electric starter for motors, just introduced by Messrs. C. A. Vandervell and Co., recently announced in The Aeroplane, the firm have found it impossible to cope with all the demands for booklets, drawings, etc., but inquiries are being dealt with as rapidly as possible.

KEEP THE HOME CARS TURNING.

The intense activity everywhere displayed in the Naval, Military, and Aircraft Departments of the British Service just now is reflected in no uncertain fashion by the urgent requests pressed upon Barimar, Ltd. In every branch of public service the skill of Barimar specialists in recreating fractured parts and defective radiators has attracted great attention, and the London firm is entitled to take credit to itself for the splendid manner in which it has organised all its departments

Major A. Cameron, of the General Staff, bears witness to Barimar's work in the following words:—"I have received the radiator. I may say at once that I am most appreciative of the efforts that have been made in order to effect the repair of this part expeditiously. The work appears to have been carried out in an eminently satisfactory manner, and I am bringing this to the notice of the authorities with whom I am in contact." Both public officials and private individuals whose cars are temporarily brought to a standstill cannot do better than call on these well-known specialists at 10, Poland Street, London, W.1.

ALEXANDERS' GREAT PLANS.

At London Sessions, on Oct. 10th, before Sir Robert Wallace, K.C., a Greek clerk, named Facdo Cokinaki, aged 28, was indicted for stealing plans for the construction of aeroplanes and hangars and certain letters, belonging to William James Henry Gordon Browne and another, trading as Alexander and Co.

Mr. Browne said that the plans were worth about £200 and were his personal property. On missing them he communicated with the police, and a parcel containing the plans was found in the cloak-room at the Piccadilly Tube Station.

In cross-examination by Sir Archibald Bodkin, who defended, Mr. Browne said that the defendant told him that he would return the papers if he got the sum of £27 10s., which the prosecutor's partner owed him.

On the Judge's suggestion, the jury returned a verdict of "Not Guilty," and the defendant was discharged.

AIRCRAFT PRODUCTION.

Nearly 12 months ago, Colonel G. O. Squier, of the U.S.A. Signal Corps, gave, when he addressed the National Academy of Science at Boston, Mass., a summary of aeronautical problems requiring investigation. The protective coating of aeroplane metal parts was one item among many of supreme importance.

The usual practice of painting or enamelling strut ferrules, rib sockets, clips, etc., is, at the best, only a compromise. The safety factor of any one metal part only remains as designed when the piece is sound; the reduction of the metal by rust (the most usual corrosion), either over the whole or in part, immediately lowers the safety factor value, and consequently the life of the machine, also possibly that of the pilot

A conception of quick deterioration is more impressive when it is known that the reduction in diameter by only 0.001 of a rod having a breaking point of 40 tons lowers the breakdown limit by more than 1 cwt. It does not take long for rust to attain a thickness of 0.005 in., and often that hundred-weight is wanted.

To be a protection, the coating on the metal part must be thoroughly amalgamated with the surface, or skin, on the piece it is desired to safeguard. The slightest mechanical injury to paint reveals its weak tenacity. Again, it is rare, even in the best work, to find a paint that is not porous and does not blister. Stove enamel is little better, owing to its brittleness, and with the grades of steel now being used, even comparatively low temperatures have an uncanny way of lowering stress values.

The foregoing facts caused the writer to gather data regarding the protective coating of ferrous metals from hot galvanizing to oiling. Any process involving treatment by heat (and they are the majority) was at once placed on one side. The methods remaining comprise the whole gamut of electro-plating.

The commonly-used metals, such as copper, nickel, etc., do not afford sound protection for any period unless specially manipulated; also their galvanic relation to ferrous articles in the presence of atmospheric moisture causes a more rapid transformation of the iron into rust than would be the case if the iron were not "protected" by them.

The only sound proposition in this category is that of galvanizing by the electro-deposition of zinc. As a metal, zinc is electro-positive to iron or steel, and this is the main reason galvanizing in any form is the most commonly used protection against rust. Hot galvanizing has been rejected on account of the heat necessary, and the only practical other method is cold galvanizing, or electro-galvanizing, both titles of importance.

By this process a strong adherent film of zinc is deposited on the strut ferrule, or what not, in such a manner that the configuration is unblemished, a result unattainable by any other process of galvanizing. The charm of this is apparent when accurately-machined parts are considered.

It is essential that all dirt, grease, oxide, etc., be removed from the article before it can be plated with zinc; this necessity proves the close affinity of the deposit with the iron. A dirty patch does not become coated, and is apparent to the eye. Very few processes have this ability, the piece generally appearing to be protected and failing at some point after being in use for a short period; such can rarely happen to electro-galvanized work owing to the immediate visibility of any imperfection preventing the use of badly-executed work.

Mention may be made here of the practice of electro-galvanizing high-pressure, solid-drawn, steel tubing. To the trained eye, a tube that has a faulty structure is easily discernible when electro galvanized, but in the original bright state it would be practically impossible to detect the flaw.

Since the vitality of an aeroplane is dependent on many ingeniously light metal parts, the desirability of these receiving protection against corrosion is one of paramount importance.

The same process is also applicable to various parts, such as gun-mountings, synchronous firing gears, bomb release gears, etc., etc., and would save many a jam.

Woodcraft enjoys a protective coating of varnish, but the scientific rust-proofing of the metal principals seems to have been overlooked by the powers that be.—J. CLANE.

A SUCCESSFUL SCHOOL PILOT.

The part played by the instructor at a flying school is not without its responsibilities. In the first place, he has to deal with all sorts of human material, from the man who was born a pilot to the man who is congenitally unfitted to fly, and setting aside immediate responsibility for the bodily safety of his charges, he knows that on his tuition rests to a considerable degree the success or failure of the pupil of the future.

Among those who have done well in this work is Mr. Edgar Brynildsen, a Norwegian subject who has been associated with British aviation since 1912, when he worked at gliding with M. José Weiss, at Amberley.

Since then Mr. Brynildsen has adopted the teaching of flying as a profession, and both at Hendon and at the Bournemouth Flying School has done some very good work, most of his pupils having passed into the Flying Services.

Although Mr. Brynildsen's career of instruction has been remarkably free from accident, both as regards himself and his pupils, various humorous incidents have occurred from time to time, such as are met with at all flying schools. One story which he tells is really too good to miss, and it is best told in his own words:—

Mr. Edgar Brynildsen.

"A few weeks back a pupil was taking his 'ticket.' He got up to about 3,000 ft., lost sight of the aerodrome, and began taking a straight course right away from same, and was getting out of sight. I then got out a more powerful machine (80 Caudron), and set off after him. After flying about seven miles I caught him up as he was landing in a field. I started spiralling down, and landed in the same field. I found him with machine somewhat damaged through bad landing, and with crowds of people gathering round him, all in the belief that it was a Hun machine which I had brought down, having heard my engine backfire and believing the explosions to be machine-gun firing."

In addition to his regular school duties, Mr. Brynildsen is prepared to undertake the testing of standard machines or experimental flying. He is certainly to be recommended as a safe and steady pilot.

THE PATENTS INDEX.

The subjoined list of recent inventions has been specially compiled by THE AEROPLANE from the current Official Patents Records.

PATENT APPLICATIONS.

Blackburn Aeroplane and Motor Co. Deck flying wheels, trucks, or trollies, for aeroplanes, etc. No. 14793. Oct. 12th.

Blackburn Aeroplane and Motor Co. Aircraft. No. 14864. Oct. 13th.

Carson, J. H. Manœuvring apparatus of aeroplanes. No. 14790. Oct. 12th.

Clark, W. G. Covering material for aircraft. No. 14544. Oct. 8th.

Harris, W. P. Propellers, etc., for aircraft. No. 14506. Oct. 8th.

Hawksley, A. F. Wheels for aeroplanes. No. 14640. Oct. 10th.

Killen, E. B. Means for destroying aircraft. No. 14789. Oct. 12th.

Killen, J. K. Safety device for flying-machines. No. 14508. Oct. 8th.

Lumb, G. F. Means or motors for driving propellers of aircraft. No. 14669. Oct. 10th.

Mees, A. B. Propellers for aircraft. No 14506. Oct. 8th.

Molins, W. E. Machine for winding aeroplane turnbuckles, etc. No. 14548. Oct. 8th.

Nalder, A. F. Method of setting optical finding or sighting apparatus, and means of application to aircraft. No. 14747. Oct. 11th.

Parnacott, A. E. Means for lowering captive balloons or airships. No. 14668. Oct. 10th.

Robinson, T. Attack upon aircraft by gunfire. No. 14639. Oct. 10th.

Sykes, W. Hydroplanes, etc. No. 14553. Oct. 8th

Tarranr, W. G. Aeroplanes. No. 14610. Oct. 9th.

Yorke, W. Means for indicating balance of aircraft, etc. No. 14514. Oct. 8th.

COMPLETE SPECIFICATIONS ACCEPTED, PRINTS OF WHICH CAN BE OBTAINED ON AND AFTER NOVEMBER 1ST, 1917.

109,991. Sept. 27th, 1916. Connor, T. J. Landing chassis of flying-machines.

101,639. Sept. 30th, 1915. Redini, G. Carburettor, more particularly for use with aviation engines.

110,030. Oct. 10th, 1916. Patent Corporation, and Thompson, W. P. Flying-machines.

ABRIDGMENTS OF RECENTLY PUBLISHED SPECIFICATIONS.

108,664. Internal-combustion engines, gas turbines, etc. BOERNER, A., 37, Zeekant, Scheveningen, Holland.

In order to maintain constant power in engines for airships, etc., the carburettor or carburettors are supplied with air from a compressed-air reservoir, means being provided in the air-supply passage for governing the pressure at which the air is supplied. Preferably the governing-means consists of an adjustably-loaded reducing-valve, and the air reservoir may be provided with an adjustably-loaded safety-valve or a number of differently-loaded safety-valves, any of which may be locked.

AERO-ENGINE APPRENTICES.

The scheme for the free training of apprentices to the aero-engine industry, which was formulated by the management of the Gnôme and Le Rhône Engine Co., for adoption at their works at Blackhorse Lane, Walthamstow, is now in working order.

The manager of the works, Mr. A. W. Towse, has now been able to arrange for every boy employed to become an indentured apprentice, and he has been able to arrange with the authorities concerned with higher education in Walthamstow to hold special evening classes for these boys. Boys working on the night shift are allowed to start at 10 p.m. in order to make it possible to attend these classes. Special demonstration lectures will also be arranged.

One great difficulty which had to be met was the very poor general education possessed by the majority of the boys, which made it impossible for them to pass the entrance examinations for the ordinary technical classes. For this reason the special classes arranged will deal the first year with reading, writing and arithmetic, made interesting by the introduction of engineering terms, quotations, and elementary mathematical work relating to engineering.

The operation of this system of training and apprenticeship will be watched with the greatest interest.

Those who wish their sons to enter the aircraft industry under conditions which will enable them to get on in the world are strongly recommended to apply for a free copy of a booklet entitled "On Apprentices," which is issued by the Gnôme and Le Rhône Engine Co., Blackhorse Lane, Walthamstow, E.17. Two stamps should be enclosed to cover postage.

A CRADOCK EXTENSION.

The well-known Wakefield firm of George Cradock & Co., Ltd., steel wire rope manufacturers, are now represented in the United States by Samuel Swett, of New York.

George Cradock & Co. have had over sixty years' experience in the manufacture of steel wire ropes, and in view of their special experience in the manufacture of steel cable for aeroplanes from the very early days possess very special knowledge of everything connected with the manufacture of steel strands, cables and tension wires for all kinds of aircraft

RAW MATERIAL.

Mr. L. A. Legros, the outgoing President of the Automobile Engineers' Institution, speaking at the Royal Society of Arts, on October 10th, said that the number of inspectors of aeroplanes had grown from a few hundreds four years ago to several thousands. They had been recruited from every class and trade—people who had been engaged in all sorts of odd and quaint employment.

He heard of an aeroplane worker who used to make the dots on dominoes, and another who once put the nicks in penknife blades. He had no doubt that inspectors could be found who used to dot the "i's" on tombstones. Only war revealed these curious employments.

In the erection of aeroplanes the man who shone best and was most useful was the organ-builder. He stood head and shoulders above everyone else, and was followed by the pattern-maker; but in propeller work, where the pattern-maker might be expected to be first, the man who came out best was the chair-maker.

TIMBER MEASUREMENTS

Those who are only now beginning to take an interest in timber may be glad to know that there are twelve super, or square feet, to a cubic foot. The price of Walnut and Mahogany should, therefore, be multiplied by twelve to ascertain the price per cube foot.

On reference to the Current Prices List, issued in THE AEROPLANE, it will be observed that Ash and Spruce are "Starred," "Price includes selection and delivery." This implies that the wood is in planks.

AIRCRAFT TIMBER.

A Reuter message from New York on October 9th stated that Mr. Arthur F. Thane has now been appointed Purchasing Agent, for Great Britain on the Pacific Coast, of lumber for aeronautical supplies. Mr. Thane will also have charge of the shipping on the Pacific Coast in the interests of Great Britain.

[Mr. Thane's qualifications as a selector of aircraft timber are not familiar to the Aircraft Industry as a whole, but doubtless he has a knowledge of his subject.—Ed.]

Mr. R. B. Maxwell, assistant curator of the section of wood technology at the U.S. National Museum, has resigned in order to accept a position as chief inspector to the American Propeller and Manufacturing Co., of Baltimore, Md.

USEFUL WORKSHOP TABLES.

Copies of the Screw Thread Table, compiled by Mr. V. P. Benedict, and published recently in this paper, also copies of the Table of Limits and Allowances, and of Metric Conversions, may be obtained from this office, price 1s. the set. These are printed on cardboard suitable for framing or for sticking on the walls of workshops and offices.

FITS AND MISFITS.

The following letter has been received:—

Sir,—Re Fits, Misfits, and Limits, page 1029, Oct. 10th, 1917. Under above title and in subdivision "Limits," hole is given at maximum 1.0005 inch. Later, in dealing with the shaft, largest permissible hole is given as 1.00025 inch, and smallest diameter of shaft at 0.99925 inch, giving a clearance of 0.001, but surely this should read 1.0005—0.99925 equals clearance of 0.00125.

(Signed) N. PEMBERTON.

Mr. Benedict replies:—

Mr. Pemberton is right in his contention that the figure should have been 0.00125 inch instead of 0.001 inch. The error is an obvious one of simple addition and subtraction, but in quoting to illustrate the point figures were taken somewhat haphazard and were not intended to represent dimensions for actual application.—V. P. B.

AEROPLANE TAPES AND SMALLWARES.

In these days it is a very rare occurrence to find a firm which holds a large stock of any kind of material or articles of trade, but one is pleased to receive assurance from Messrs. John MacLennan and Co., of 30 and 31, Newgate Street, E.C.1, and Glasgow, that they are in this enviable and happly position, and can, therefore, give quick delivery of any of the articles which they advertise. This is a most important point in view of present circumstances, and should be carefully noted by all aircraft firms.

A REMINDER.

As recently noted in this paper, in the recently published Annual Report of the Advisory Committee for Aeronautics it was stated that the investigations on the subject of aeroplane radiators had been brought to a conclusion and recommendations made for standardisation.

Effect has now been given to these conclusions by the Air Board, and a confidential circular letter has been issued to aeroplane contractors and radiator makers, instructing them as to the material which is to be used for this purpose in future designs. Inquiries on the subject may be addressed to the Department of Aeronautical Supplies, Room 609, Air Board Office, Strand, W.C.2.

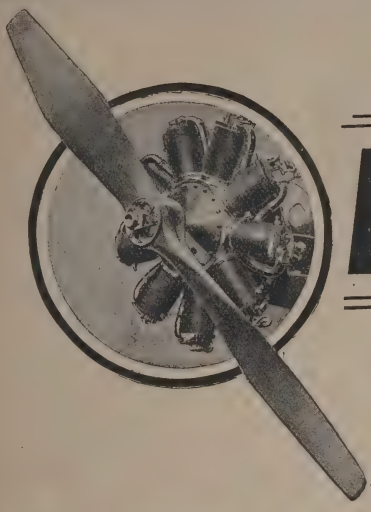
THE HIGHFLYER.

"The Highflyer," house journal of the Norman Thompson Flight Co., Ltd., Middleton, Bognor, has now reached the dignity of pukka printing, its editors finding its increasing circulation too much for the office duplicating machine. The price remains the same, namely, 6d., but in view of the excellent paper and printing, the general dignity of the "layout" and the really excellent literary matter, the price is not excessive.

The October issue contains a most interesting history of early naval vessels, named after the county of Sussex and its principal towns. "Airman Jock" is a cheery song set to the tune of "Longshoreman Billy," sung by a Celtic "pilot" against himself.

Those who wish to inspect the other absorbing features in "The Highflyer" should send seven stamps to the editor for a copy.

B.H. THIMBLES.



The aircraft constructor who experiences difficulty in obtaining adequate supplies of such harmless but necessary accessories as B.H. thimbles and wire ferrules is invited to communicate with Whiteman & Moss, Ltd., of 15, Bateman Street, W.1., and mention THE AEROPLANE. This firm holds a good stock of these parts, and immediate delivery can be given.

BURYING A RIVER.

The consignment of the Cardinal Wolsey River to its subterranean oubliette at Mr. J. A. Whitehead's combined estate and aerodrome at Handworth Park was performed on October 16th by the Lord Mayor, as advertised, despite the interference of the rain, which apparently feared that the disappearance of the river into a dug-out would affect its interest in the watershed as a going concern.

The "reinforced concrete inverted syphon," which can pass 27,000,000 gallons of water daily, worked excellently, and settled down to its task with the spirit usually associated with syphons.

Just before the river was diverted, fifty soldiers marched through the conduit, and it was well for them that the electric button which was arranged to set the machinery of diversion in operation was not touched prematurely, for in such an event they would probably not have found the result diverting. However, one is gratified to find that, despite the demand for men, soldiers are available for such amusing antics.

MARKET REPORTS.

Prices given are for quantities on usual terms.

October 18th, 1917.

COPPER.—The chief interest centres round conditions prevailing in U.S.A., production and distribution being the two main problems attracting attention. The former does not appear to improve. It was rumoured that the California dispute had been settled. If this is correct, the resumption has not been permanent, as the mines are again shut down. The various reports received do not indicate any possibility of an early settlement, and, in consequence, the question of supplies is still very acute. It is reported that the U.S. Government are considering a Central Pool Board for distribution of Copper and other materials required for work of national importance. Conditions here remain unaltered; official prices remaining the same. Strong Sheets are now £150.

Comparative Prices.

To-day	£110 per ton.
Last Month	120 per ton.
Last Year	122 per ton.
Average Price, 1916	116 per ton.

TIN.—The price of tin has now advanced to £247 10s., which is the highest price reached this month. The shortage of supplies cannot be held responsible for this advance, large supplies having recently been received. Buyers are evidently being influenced by the uncertainty of the shipping situation, and, in consequence, there has been a large demand for near deliveries.

Comparative Prices.

To-day (17th)	£247 10 0
October 12th	246 10 0
October 8th	245 0 0
Last Month	246 0 0
1916	179 10 0
Highest Price, 1916	205 0 0

LEAD.—Official prices remain unaltered. The output in Australia has been impeded, but it is reported that the situation is now much more satisfactory. It is, of course, impossible to obtain supplies here for anything but work of national importance.

STEEL.—The Steel output is increasing by leaps and bounds and, furthermore, the restrictions upon consumption for ordinary purposes are being tightened. This is certainly very essential as there still appears to be a large quantity of Steel being used for purposes where substitutes would do, and also for ordinary peace-time purposes. Although the restrictions will cause inconvenience in certain directions, in consideration of the vital importance and urgency of large supplies of Steel for aircraft and shipbuilding and other national needs, the stricter and more rigid control of consumption should be welcomed. There is, of course, the usual fear of manufacturers, who are engaged on frightfully urgent contracts, being delayed owing to the filling up of forms, obtaining permits, etc., etc.

The officials handling this side of the business are recommended to study the systems prevailing in other departments, with the object of inventing one which would eliminate this prevalent complaint. Needless to say, this would not be a difficult task.

The proposal that the U.S. Government should take steps to increase the shipments of Steel to this country does not appear to have had any definite result, although the U.S. firms apparently anticipate something being done, and have sent supplies here at a cheaper price.

Prices still remain unaltered, although the price of Cast Steel is stiffening; this was anticipated in the previous reports

TIMBER.—Up to the present unofficial statements only appear to have been received regarding Silver Spruce substitutes, although the information appears to be common property, at any rate, the demand for the woods has already commenced. There is every possibility of large supplies being available, and there is no occasion for panic. The shortage of other woods continues, Walnut and Mahogany being at a premium.

The Timber problem is, so far as the Aircraft Industry is concerned, one of the most serious, and it is gratifying to learn that the Air Board are seeking the assistance of experts of very wide and long experience. It is to be hoped that their advice is treated seriously.

It is generally agreed that the price of the Silver Spruce substitutes will be cheaper than the price at present ruling for Spruce. The price of the latter is still mounting upwards, English Ash also is keeping it company.

FABRIC.—It is very disappointing indeed to learn that the Irish labour troubles remain unsettled. The position is now becoming most serious; several factories are becoming alarmed at their low stocks.

CURRENT MARKET PRICES.

Oct. 4th, 1917.

The prices given below are the prices ruling on the above date.
TERMS.—Usual for the various materials mentioned.
Prices of old metals are as quoted by scrap dealers.
Prices must not be taken as specific quotations for definite quantities delivered to any part of the country.

ALUMINIUM.	
Ingot	£225 per ton.*
Remelted	£210 per ton.*

AMERICAN INDUSTRIAL NOTES.

It is reported that Messrs. Henry M. Leland and Wiflred C. Leland, who recently resigned their posts as president and general manager of the Cadillac Motor Car Co. of Detroit, Mich., have completed the organisation of a new company with 1,500,000 dol. capital.

The new concern has been registered as the Lincoln Motor Co., and has acquired premises formerly occupied by the Rands Manufacturing Co., in Detriot. Two thousand men will soon be employed, and an output of twenty aero engines per day is expected.

* * *

Mr. S. H. Humphrey has been appointed general manager of the Wright-Martin Aircraft Corporation, New Brunswick, N.J. Mr. Humphrey was formerly manager of Briscoe and Hupp.

Mr. John R. Cautley, who has for some time been engineer for Peter A. Frasse and Co., New York, has joined the staff of the Wright-Martin Aircraft Corporation as engineer at their Washington premises.

* * *

Mr. Charles L. Taylor, president of the Carnegie Fund Hero Commission, has become associated with the Loughead Aircraft Manufacturing Company, of Santa Barbara, Cal. A large site has been acquired, and an important factory is to be equipped within ninety days.

The immense new plant of the Curtiss Aeroplane and Motors Corporation at Buffalo should now be ready for business. Previous estimates had indicated that the plant would not be finished before January 1st.

Despite the fact that the land for the new plant was only secured about three weeks ago, all of the foundations have been laid and two of the bays have been completed. Four miles of track, giving the company the very best of railroad connections, have been laid.

The new plant will occupy nearly 100 acres of land, and will increase present capacity over 600 per cent.

Above facts indicate that the big Government work for aeroplane and parts will be well under way by November 1st. It had not been expected that anything of a substantial character would be started before January 1st.

By the closing two months of the year the Curtiss Co. will be in a position to turn out anywhere from 6,000,000 dollars to 8,000,000 dollars of aeroplane and parts a month. This means business greater each month than was done by the company in the first seven months of the current year.

By the first part of 1918 it is expected that business will be turned out at close to 10,000,000 dollars a month, and if there is no falling down in present plans the capacity will ultimately be brought up to better than 12,000,000 dollars a month.

* * *

Mr. Henry Ford announces that the Ford Motor Company is now making 200,000 steel aeroplane cylinders for the United States Government which are to be delivered at the rate of 1,000 per day.

* * *

The Zenith Carburettor Co., of Detroit, is building an addition to its present factory which will permit an increase of 80 per cent. in production capacity.

* * *

Egbert B. Cresswell, formerly sales manager of the Thomas Aeroplane Co., of Ithaca, N.Y., died on September 9th as the result of injuries received while flying at the Davenport Aviation School, where he was manager. Mr. Cresswell was esteemed by all those concerned with the American aircraft industry, and was regarded as a most promising business man.

THE GRAHAME-WHITE SWIMMING CLUB GALA.

The first annual Gala of the Grahame-White Swimming Club was held at the Hampstead Baths, Finchley Road, on Sept. 29th.

Among the spectators present were Mrs. Winston Churchill, the Hon. Mrs. Henley, Mr. and Mrs. C. Grahame-White, Mr. H. Matthews, Mr. Wilie, Mr. Blessley, and Inspector Parker. The Grahame-White Orchestra made its début on this occasion, and rendered some catchy music throughout the evening.

The Gala was declared open by Mr. H. Matthews, one of the Company's oldest directors, who hoped that such entertainments would be the means of stimulating a sociable feeling among the employees, and putting them more in touch with one another. A special attraction in the programme was an exhibition of diving by Mr. Biggs, superintendent of the baths, accompanied by the lady attendant, which was greatly appreciated by the audience.

At the conclusion the prizes were presented by Mrs. Winston Churchill, assisted by Mr. Grahame-White.

The following is the list of prize winners:—

Ladies' 60 yards: 1st, Miss G. Thomas; 2nd, Miss G. Bellew; 3rd, Mrs. Cotton.

Men's 60 yards: 1st, W. Rezac; 2nd, R. Cook; 3rd, J. Tizzard; 4th, F. Cole.

Three Lengths Sealed Handicap (Club Final): 1st, Wm. Wier; 2nd, A. Hood; 3rd, F. Feldman.

Ladies' 60 yards Open Event: 1st, Miss Blandford; 2nd, Miss De Coverley.

40 yards Scratch (Club Championship): 1st, H. Stewart; 2nd, J. Desack; 3rd, G. Rogers; 4th, Crutchley.

Men's 30 yards Club Learners Race: 1st, H. Brightman; 2nd, W. Ward; 3rd, W. Law.

Men's 60 years Team Race: B. T. H. M. Co. 1st.

Men's 60 yards International Race: 1st, W. Weir; 2nd, J. Desack.

The final for Mrs. Churchill's Challenge Cup, and the Hon. Mrs. Hendley's Trophy, to be won on points throughout the season: 1st, A. Hood, 26 points; 2nd J. McCullock, 25 points; 3rd, C. Tilston, 22 points.

The Club Diving Competition was won by: 1st, E. Wholey; 2nd, J. Desack; 3rd, C. Tilston.

THE ESSENTIAL OIL.

It is of interest to note that the F.I.A.T. engine of the S.I.A. biplane in which Captain Laureati made a non-stop flight from Turin to London, a distance of 686 miles, in 7 hrs. 25 mins. was lubricated with Vacuum Gargoyle Mobiloil "B." The qualities of a lubricating oil become very evident in a long flight of this description.

AIRCRAFT FINANCE

CURRENT TOPICS.

To Capitalists and Investors.

The Aeroplane Industry as a field for investment has not so far received the attention of the serious capitalist that the enormous possibilities of its coming earning power as a commercial proposition merit and call for. No intelligent observer of events can fail to be struck by the indisputable fact that every day the most important space in every prominent newspaper and journal is devoted to events connected directly or indirectly with the aeroplane. Even with the war occupying the minds of all to the exclusion of other events, constant announcements appear of the marvels to be accomplished and the important rôle which the commercial aeroplane is destined to play immediately peace once again reigns supreme.

A new industry always offers exceptional opportunities to the far-sighted capitalist. It was so with mechanical engineering a century ago, when steam power was first known, and again with electrical engineering at a more recent period. The advent of the cycle and the automobile industries are further illustrations of the same characteristic fact. The investor gifted with a little foresight and the courage of his knowledge found these inventions a quick road to prosperity.

At the moment it is only right and proper that the aeroplane should be considered solely as an implement of war. Its rapid development and multiplication is distinctly attributable to the war, but the commercial possibilities are altogether independent of this factor. War has been, without question, the stimulating element which has given us aircraft of speed, dimension and power such as it has become to-day. But in any case it was sure to have come.

The difference is that for the supreme purposes of war progress has been made in three years which, for mere purposes of peace, might not have been accomplished in ten or more years. As a result of this progress aviation for commercial purposes will be a practical proposition as soon as peace is restored.

With the coming of peace we shall witness the beginning of a new era in travel, with the regular conveyance by the air, day by day, and throughout the civilised world, of mails, passengers, and the lighter kinds of merchandise. Having got so far as a consequence of the world war, it is quite certain that the scientific men who have been working at the problems of aviation during the last three years will not desist when the great conflict is over. With commercial aviation as a "going concern," they will have every inducement to continue their efforts, but with a different goal—not the greater efficiency of fighting machines, but their greater safety, reliability and comfort as a means of transit.

Flying Trains.

Already we hear of planes being prepared along these lines. The British Press recently published a cable from Reuter's correspondent, who had had an interview with the Brothers Caproni, the celebrated Italian aeroplane constructors. Although naturally prevented, for obvious reasons, from giving any details regarding their factories, they stated that the factories were working day and night, and employing five thousand workmen. These factories at present cover four times the area they occupied before the war.

Signor Caproni believes that the development of aviation will increase after the war, and that the day is approaching when lines of aeroplanes will connect town with town, country with country, and continent with continent, with aerial trains, luxuriously fitted up, capable of transporting upwards of a hundred passengers, and of travelling from 125 to 190 miles an hour.

Aeroplanes for this purpose, they say, of from 300 to 500 h.p., will be built according to the biplane and multiplane system, because plurimotor types obviously afford a genuine guarantee of safety. The introduction of the multimotor system, according to the Signors Caproni, would almost entirely obviate the interruption of journeys through the breakdown of the motor. Immediately after the war large trans-oceanic aeroplanes will be constructed powerful enough to carry fifty to sixty passengers from Europe to America and back.

The Caproni triplanes, they point out, can easily carry thirty passengers between Milan and Turin. A Caproni biplane, piloted by Signor Gabriele d'Annunzio, with three others on board, recently accomplished, without landing, a flight of 875 miles.

These are not idle dreams, and it will be well for the cautious investor to take the future of aviation, as a means of rapid commercial transport, into his calculations. At the same time, he must be on his guard. Already one hears of several schemes being prepared to foist unsound "wild-cat" propositions under the guise of Aeroplane Companies upon an innocent public, but every effort will be made by this paper to prevent the industry being sullied by such attempts and manœuvres, and it will not fail in its duty whenever the occasion presents itself.

Defence of the Realm Regulations.

Directors of public companies and particularly secretaries, as well as shareholders, will do well to make a careful note of the Treasury requirements with regard to the declaration which existing regulations demand should be endorsed on every transfer of shares. Unless this formality is complied with, the authorities will refuse to stamp the transfer, which, without the "ad valorem" stamp duty affixed, is invalid, and all parties to the document liable to heavy penalties. The declaration has to be made in the following set form :—

Declaration by Transferor.

"I hereby declare that I am not a person resident or carrying on business in any country at war with Great Britain, or treated as an enemy under any proclamation relating to trading with the enemy, or a member of a body of persons mentioned in the Statutory List under the Trading with the Enemy (Statutory List) Proclamation, 1916, No. 3, or an enemy subject within the meaning of the Trading with the Enemy Amendment Act, 1916, and that the within written transfer is not made by me on behalf of any such person as aforesaid."

Signature.....

Declaration by Transferee.

"I hereby declare that I am not a person resident or carrying on business in any country at war with Great Britain, or treated as an enemy under any proclamation relating to trading with the enemy, or a member of a body of persons mentioned in the Statutory List under the Trading with the Enemy (Statutory List) Proclamation, 1916, No. 3, or an enemy subject within the meaning of the Trading with the Enemy Amendment Act, 1916, and that the within written transfer is not made to me for the benefit of any such person as aforesaid."

GENERAL INFORMATION.

Armstrong, Whitworth (1916).
Austin Motor (1916).
B'ham. Small Arms (1915-16).
Rolls Royce.
Rudge Whitworth.
Straker-Squire (1915).
Sunbeam Motor.
Thorneycroft (J. I.) & Co.
Vickers (1915 and 1916).

Owing to the difficulty of estimating liabilities under Finance and Munitions Acts, the accounts will not be ready until a later date.

CLOSING OF TRANSFER BOOKS.

The Transfer Registers of Straker Squire, Ltd., will be closed from October 24th to November 7th, inclusive.

BALANCE-SHEETS.

A. DARRACQ & CO.—The Report and Balance-sheet for the year ending September 30th last has just been issued. The annual meeting of shareholders is convened to be held at Salisbury House, E.C., on the 29th inst., at noon. The accounts to hand show a net profit for the year amounting to £125,015, after writing off depreciation of buildings and other charges shown in the profit and loss account. This net profit, added to the sum of £12,015 brought forward from last year, gives a total to the credit of the profit and loss account of £137,030. After payment of the half year's dividend at the rate of 7 per cent. per annum on the Preferred Ordinary shares, distributed on April 2nd, 1917, amounting to £13,215, and an Interim dividend on the Ordinary shares of 5 per cent., paid on April 16th, 1917, amounting to £13,750, there remains a balance to the credit of profit and loss account of £110,155. The directors have transferred £30,000 to reserve account, making the same up to £200,000, and now propose, after providing for the dividend on the Preferred Ordinary shares, paid October 1st, 1917, which amounted to £13,125, to declare a further dividend at the rate of 10 per cent. on the Ordinary shares, which will absorb £27,500, making a dividend of 15 per cent. for the year, and to distribute a bonus of 5 per cent. on the Ordinary shares, amounting to £13,750. If the dividend recommended on the Ordinary shares be approved by the shareholders, a further dividend at the rate of 3 per cent. per annum on the Preferred Ordinary shares, amounting to £11,250, will be payable under the Articles of Association of the company to the holders of the Preferred Ordinary shares. There remains after providing for the above a sum of £14,530, to be carried forward to the next year's accounts. The directors have deemed it wise to treat one-quarter of the total distribution for the year to the holders of the Ordinary shares as a special bonus. The net profit of £125,015 compares with the previous year's result of £90,500, and the income derived from the operating concerns amounts to £97,300, showing an increase of just over £10,000. The prosperity of this company is very gratifying, and the shareholders and the management are to be congratulated on the results in these trying times.

PENDING ISSUES.

AIRCRAFT MANUFACTURING CO., LTD.—Advice reaches me that an offer will shortly be made of 250,000 Cumulative and Participating "B" Preference shares of £1 each in this company. As soon as full particulars are to hand, due notice will appear in these columns.
